This is not so in the other branches of the trade. On coats, vests, cloaks, shirts, caps, and most of the other occupations in the sewing trade the price has fallen. The contract price for pants has fallen so that it is now extremely difficult for a contractor to make a profit. The contractors' shops for pants have become somewhat larger, since it is not possible to run a small shop on the small margin which the contractor makes. If in the future the pantsmakers are able to hold their price as they have done for the last 5 years, it is probable that it will not be long before the contractor is entirely driven out of that business. Already, in the last few years, manufacturers are going into the pants business on a small scale, and former contractors are becoming pants manufacturers.

4. **Ladies' cloaks and suits.**—Women's ready-made clothing existed only to a very limited extent prior to 1880. About this time, when the Russian Jews began to migrate, an industry was established known as the ladies' cloak and suit business. The development of this business was similar to that of the men's ready-made clothing. At first cheap help was employed to work on cheap materials, but before long skill and taste were developed in the business, and very expensive plush and cloth garments were made for women's wear and distributed broadcast among the stores of the country. New York City was the center for the development of that

class of manufacture, and it is probable that at the present time over 75 per cent of the cloak business of the country is located in that city, where there are about 15,000 people in the trade.

During the busy season the average operator earns \$15 to \$20 per week; the baster, \$9 to \$15; the presser, \$12 to \$15. But the seasons are very short in this trade, usually 5 or 6 months. For this reason the prices fluctuate enormously. An expert operator can sometimes earn \$40 per week for 3 or 4 weeks in the busy season at piece work, and such wages are sometimes cited as indicating a prosperous condition of the trade. But they indicate only a disorganized state of business, with occasional famine prices. The same expert operator on the same class of work in the dull season could earn only \$10 if he worked the same number of hours. The highly speculative character of this work makes it peculiarly a field for the Jewish workman. With the high prices of the busy season he is spurred to exert himself to the utmost, day and night. At the same time Italians have recently entered the trade and have become a more serious factor than in other branches. The Jewish cloak and suit makers in New York now number about 12,000 and the Italian 3,000.

In this field the immigrant has created an industry which did not exist prior to his coming. These ready-made suits for women have indeed cut into the business of the dressmaker and home worker, but they are sold in the stores for less money than a woman would pay were she to buy the cloth and have it made up.

The manufacture of ladies' cloaks and suits is the branch of clothing which in New York, as already stated, has passed out of the hands of contractors working for large manufacturers and into the hands of small manufacturers working in their own inside shops. The reasons for this change have been considered on page —.

The cloakmakers were first organized in 1884. The history of their organization is somewhat similar to the history of the other organizations in the Jewish trade, but the features are intensified. It is customary for them to come together in large numbers after samples are made for a coming season and before the prices have been made. They form a strong organization, send a committee to the manufacturer, make terms for the price of labor for the season, and then neglect the organization until the next season. The initiation fee in the union has usually been small, from 25 cents to \$1.

The first large strike was in 1890, when they were out for 8 weeks and endured great suffering, but they finally won the strike. The price for labor was raised to such an extent that the cloakmakers were able to earn as much as \$25 to \$30 per week, making at that time a sort of standard for the price of labor, which has had a strong influence in all succeeding years. When in the busy season they are able to earn what they did in 1890 they are satisfied. If not, they strengthen their union and institute a strike.

The following are the local branches of the cloakmakers' union: Operators' Local, No. 1, with about 2,000 members out of 4,000 in the trade; Tailors' Local, No. 2, with about 1,000 members out of 4,000; Pressers' Local, No. 3, with about 500 members out of 2,000; Ladies' Branch, composed of the women tailors in the trade; No. 6, with about 300 members out of 2,000 all told; Italian Branch, with about 300 members out of 3,000; Skirtmakers' Local, with about 100 members out of 2,000.

There are more Italians in the cloak business as tailors than in any other branch of the clothing trade. They usually conduct themselves about the same as the Jews. They join the unions in large numbers when the Jews join and stay out of the union when the Jews stay out. They have not as yet successfully entered the trade as a people. They work somewhat cheaper than the Jews do, but they are not so much alive to the different changes in the trade, and do not take up so easily the different modes of production and the different styles. For this reason they have not the same opportunities in the trade as the Jews. But their number is slowly increasing, and it is probable that before long they will be the most formidable factor in the trade. As it is they form about 20 per cent of the people engaged in the cloak business.

In Chicago cloaks were originally made in large shops, by women and girls, working by piece work. When the immigration of Russian Jews began in 1881 the contract system was first established in the home shops, where they were able to do the work cheaper than in the large shops.

The price for labor fell so seriously that the Jews organized their first union in 1886 under the Knights of Labor. Following that, a strike occurred at the beginning of each season, when prices would be made at about double the figures of the preceding dull season. In 1890 a strong organization was effected which lasted until 1894. By several large strikes the union was able to regulate the wages of the workmen without so many small strikes as were necessary in the preceding years. Earnings at that time were \$16 to \$20 in the busy season and \$8 to \$10 in the slack season. The union also gained a ten-hour day in place of the preceding unlimited hours. During the depression of 1893, 1894, and 1895 the union was almost broken

up. The price for labor went down to nearly one-half. The union was again strengthened in 1896 and lasted until 1898, when it was again broken up by a hard-contested fight against large cloak manufacturers. In 1901 it was again reorganized.

In 1889 the cloak manufacturers began to replace men's outside shops by women's outside shops in districts populated by immigrant Poles and Bohemians. These girl's shops have never been organized, and they have practically displaced the Jewish men on all the cheaper work, their contract prices being about two-thirds of the prices paid to the men. A large number of the men who were driven out of the trade by the girls have gone into the ladies' tailoring business, opening small shops and making ladies' garments to order. Those who continue to work at the better grades of ready-made work are able to earn about the same wages as in 1890.

The ten-hour day which they gained at that time is still customary with a large number of men, though not under the control of a union.

6. **Knee-pants makers.**—The nationalities engaged in the manufacture of knee pants in New York number about 1,300 Jews and 200 Italians in shops and 1,000 Italian home finishers. About 800 are working with foot power and 700 with steam power. The steam-power shops are "inside shops," and the foot-power shops are run by contractors. In the steam shops 80 per cent of the employees are men. The first steam shop was started in 1895, in Brooklyn, with an intense division of employment and the employment of men, which continues even at present. This manufacturer moved to New York in 1897 to gain Italians.

In 1890 the shops were in the homes of the Jews. Contractors employed from 5 to 7 persons. Each person had to furnish his own machine and bring it to the home of the contractor. The trade was driven from the tenements by the legislation against tenement-house manufacture, and the contractors then rented little shops.

In 1893, when the manufacture was still in tenements, there was a strike to compel the contractor to buy his own machines. The strike was lost. The union was reorganized and struck again for the same reason in 1894, and won. Since then the manufacturer and contractor supply the machines.

In 1897 there was a strike against the manufacturers direct, on the demand that they should hold themselves responsible for the prices. Two-thirds of the manufacturers signed the agreement. Of these only three lived up to it. The agreements were not sustained in court, on the ground that they were given by the manufacturers under duress.¹ In 1899 there was another strike, and this time promissory notes were demanded. This strike was successful. The demand for this security by notes was not continuously nor extensively practiced, because the other trades being unorganized, the members of this union were replaced.

At the present time the union is comparatively strong. It controls one large shop and 25 to 30 small ones. It numbers about 500 members, although the membership is continually changing. Every general strike at the beginning of a season has been won, but prices have always gone down within 3 weeks. In the last 3 or 4 years Italian women have taken the places of strikers. They begin work at \$1.75 per week.

The earnings of the men are now about the same as in 1890, namely, \$12 per week in the busy season of about 6 months, and \$8 in the slack season. But the workmen have a 10-hour day instead of 14 hours, and their efficiency through division of labor and increased speed has so increased that they produce as much work per day as formerly.

In Chicago, in the early years of the knee-pants industry, the prices offered were \$2 to \$2.50 per dozen, and the people employed made fairly good wages. But as the business developed and a large number of immigrants entered, principally Russian Jews, the price began to fall, so that at the present time the knee pants are taken out by the contractor at from 80 cents to \$1.20 a dozen. Machine operators formerly earned about \$12 per week. Now they only earn \$8 to \$10, while their efficiency has almost doubled.

In 1890 a union of knee-pants makers was formed in Chicago and it has been in existence since that time, although very weak. When there is plenty of work, the people are generally alive to the fact and strike for higher wages. When work is not plenty, they feel helpless and wages run down, so that men work for \$4 and \$5 during the slack season. On knee pants in Chicago the people work more hours per day than in any other branch of the trade, in most of the shops the men going to work at 5 o'clock in the morning and working until 9 or 10 in the evening. This is the case not only in the busy season, but even during the slack season.

The people are continually changing in this trade. After a few years, many of them, exhausted and with health destroyed by foot-power machines, are supported by charity. A large number live partly on charity even while they are working at the business. The trade is more seriously affected by home work for pin money than other branches. When the knee-pants makers strengthen their union and inaugurate a strike, they usually find that they strike the work away from them-

¹ See also testimony of I. A. Hourwich, Manf. and General Business, p. 150, vol. vii.

selves. In the last few years Polish girls' shops are replacing the men's shops, although the Jewish men still make the larger number of knee pants because they work harder. The contractors themselves have not succeeded in the business. Only a few of them have been able to build their own homes or shops.

6. *Children's clothing.*—The manufacture of children's coats in New York is carried on mostly in large shops, where there is an intense division of labor. The majority of the employees are men. Foot power prevails. The great majority of the people in the trade are Russian Jews. Probably 10 per cent are Poles and 5 per cent Lithuanians. The shops work by the week, 11 hours a day, and in many cases still longer hours. Where the division of labor is not very intense, they work by the piece, and work an unlimited number of hours. The price for labor is almost as low as the prices paid in the knee-pants business, the operators and pressers earning from \$6 to \$12 a week, the majority getting \$7, \$8, and \$9, working eleven hours a day.

The trade is being extended very much year after year and more and more people are being engaged in it, but the condition of the workers has become worse within the last few years. At one time they formed a union, but were sold out by their leaders and the union was broken up. Efforts are now being made to reorganize. There have been many strikes and the men have won, but they have not gained any lasting benefit.

In Chicago the manufacture of ready-made clothing for children was introduced about the year 1888 in colonies of Poles, Jews, and Bohemians. As years went on, the Polish girls succeeded in getting almost a monopoly of the business. A machine girl would earn \$4 to \$7 a week; probably the majority earn between \$4 and \$5. Steam power has recently been introduced in a number of these girls' shops. The hours are usually 10. The work is done in section work, so that but little skill is required and each girl learns only a small part of the work. There is a good deal of "driving" done in these shops. Although most of the girls work by the week, it is the custom of the contractors to hurry them all the time. This is done in the larger shops by an ingenious system of "work records" by which the number of pieces completed by each girl is recorded at the end of each hour during the day. Since the girls begin work at \$1.50 a week, and there is no scale of wages for the shop, but individual bargains are made with each employee on the basis of the amount of work done, it can be seen that this continual comparison of records is even superior to piecework in its capacity of urging the girls to their utmost exertion. The system requires constant oversight and prodding, such as would be resented by other nationalities. In this way the contract price on children's coats is about one-half the price of 10 years ago, but the hands do not earn much less per week, since they work much faster. A detailed account of one of these Polish shops is given in establishment No. 6, on page 358.

No effort has ever been made to organize any of the employees in the children's coat shops in Chicago.

7. *Special-order trade in Chicago.*—Within the past 10 years there has grown up in Chicago a branch of the clothing industry known as the "special order" or "country order" trade, in which suits are made to measure for very little more than they cost when bought ready made. They are made up on the same system as ready-made clothing; that is, by the division of labor, such as machine hand, baster, finisher, presser, buttonhole maker, hand sewer, etc. Each garment is cut separately and not in lots, as is the case with ready-made clothing.

Originally this business helped to intensify the sweating system and home production. Tailors would take home with them 2 or 3 coats, pants, or vests and make them up. The trade has now developed so that the shops are growing larger and larger. There are certain manufacturers who do that kind of work in their inside shops, and there is a tendency for the inside shop to replace the contractor; but the bulk of the coats as yet are made by Jews in the outside small shops.

In these shops there is no organization. The hours of labor are long during the busy season. Following are customary earnings:

TABLE 10.—*Earnings, special-order trade, Chicago, unorganized shop.*

	Per week.
Men operators in Jewish shops, week workers: first hand	\$13 to \$15
second hand	9 to 11
Piece workers, operating on \$1.25 coat, 22 to 23 cents; on \$2 coat, 30 to 35 cents; usual weekly earnings	16 to 20
(During the slack season the income is less.)	
Basters, week work:	
First hand	11 to 13
Second hand (usually girls)	7 to 9
Hand buttonhole makers (usually girls)	4 to 10
Hand finishers (felling, buttons, etc.)	4 to 7
Pressers	9 to 12
Hand pressers	5 to 7

In the large inside coat shops the price for labor is about \$1 to \$2 per week less than in the contractors' shops, but the work is steadier, the hours are shorter, and not quite as much is required. The supervision is less rigid.

Pants and vests in the special-order trade in Chicago are made by Swedes. Girls do most of the work, only the trimmers and pressers being men. The Swedes drifted to this branch of work when they were crowded out of the ready-made work by Poles, and by their capable labor organization they have here developed the most favorable conditions to be found anywhere under the contract system. They are practically the only tailors in the country who have successfully organized the outside home finishers, including Swedes, Germans, and Italians. The Italian finishers have come into the trade only within the last 7 or 8 years, and an Italian settlement was established a few years ago in the very heart of the Swedish district, where the Swedish pants and vest makers have kept their shops. Out of 1,400 outside finishers there are about 1,000 Italians and 400 Swedes and Germans. Formerly all the finishers were Swedes and Germans. The significance of organizing the Italian finishers is seen in the price which they receive for their work, namely, 14 cents, whereas the same work is done by unorganized Italians for 9 cents in Chicago and 5 cents in New York.

The union of the special-order pants and vest makers is known as the Custom Clothing Makers' Union of America, and controls about 75 per cent of that class of the trade, having about 3,500 people organized, under the following branches: Pressers' local, composed entirely of men; fitters, trimmers, bushelers, and brushers-off, mostly men; machine operators, girls; basters, girls; finishers, two branches, one Italian, the other Swedish and German.

The following are the wages earned in the union shops:

TABLE 11.—*Wages, special-order pants, Chicago, union shop.*

	Per week.
Machine operators (girls).....	\$10 to \$15
Pressers.....	12 to 15
Trimmers.....	12 to 14
Finishers.....	5 to 9

The Swedish pants makers work 7 months in the year. Their earnings are about one-third more than the pants makers in the ready-made clothing trade, and one-third more than they themselves were earning before the organization of their union.

8. Central and national organizations of tailors.—The organizations by different branches of the clothing trade in New York mentioned in the preceding pages were organized separately at different times. In 1892 the locals in the manufacture of ready-made clothing formed a central body for Greater New York, known as District Council No. 7. This council meets weekly as an executive committee for the trade. The following locals are represented:

- No. 2, United Brotherhood of Tailors, composed of the coat tailors in New York.
- No. 10, composed of children's jacket and coat makers.
- No. 15, a mixed organization in Brooklyn.
- No. 16, vest makers of New York.
- No. 17, vest makers of New York.
- No. 25, German tailors of Brooklyn.
- No. 24, mixed organization of Newark.
- No. 55, coat tailors of Brooklyn.
- No. 6, pants makers of New York.
- No. 9, pants makers of Brooklyn.

The clothing cutters are not included.

In July of 1901 the clothing trades council of District No. 7 of New York inaugurated the first general strike of all the clothing workers that has occurred. This strike was inaugurated with a view of enforcing the policy indicated in the above series of resolutions. Hitherto each local had conducted its own strike and made its own agreements, but in this case the federation of these locals in the form of the district council has taken the matter in charge. Another new feature of this strike is the demands made directly upon the manufacturers. Hitherto contracts were made with the contractors; but in this case the district council passed over the heads of the contractors and made the demands directly upon the manufacturers. In these demands the manufacturers are asked to guarantee that the wages owing to employees shall be paid by contractors, thus making the manufacturers responsible for his contractor. Following are copies of the two agreements usually signed:

AGREEMENT WITH MANUFACTURER No. 1.

Whereas the United Garment Workers of America, a duly organized and incorporated association of the State of New York, on this ____ day of ____, 1901, promises and undertakes to furnish skillful hands of both sexes to ____ for the period of 1 year successively, whenever same are at their disposal and as may be called for by the said ____.

Now, therefore, know all men by these presents, that — of the city of New York, borough of Manhattan, am hereby held and firmly bound unto the United Garment Workers of America, and the conditions of this obligation are as follows:

That if the above United Garment Workers of America furnish the said skilful hands or employees to the said —, I obligate myself in consideration thereof to guarantee to the said United Garment Workers of America that any employees by them furnished as above shall be employed in none but sanitary shops as provided by the State factory law; and I further guarantee that whatever earnings or wages, weekly or otherwise, that may at any time hereafter and during the period of 1 year from date be lawfully due to the employees furnished as aforesaid for a period not exceeding 1 week at a time, shall be promptly and fully paid by the said —, then this obligation to remain in full force and effect, otherwise it is to be void.

Signed in the presence of —.

AGREEMENT WITH MANUFACTURER, No. 2.

The following agreement is hereby entered into between the firm of — and District Council No. 1, United Garment Makers of America:

First, all contractors doing work for said firm shall employ only members in good standing of the United Garment Makers of America, and the following conditions shall be observed in all shops conducted by said contractors:

A. The working time shall be limited to 59 hours per week.

B. Wages of employees to be paid on the last working day of each week.

C. The union rate of wages shall be paid in said shops.

Second, the firm agrees to withhold work from any of the said contractors not observing the above-mentioned conditions.

Third, the firm agrees also to be responsible for all wages that may be due the employees of said contractor at the end of each week on such work as performed on garments of the above firm, limited to 1 week's wages, and on further condition that the undersigned is to notify of any default of the contractor by 12 o'clock noon on the following day.

This agreement entered into — day of —, 1901, to terminate 1 year from date.

(Signed.)

Under the foregoing agreements it will be seen that the manufacturers guarantee that the contractors shall pay the union rate of wages, but this is done without any direct agreement as to what those wages shall be. The question of wages is dealt with in another agreement made with the contractors. This agreement specifies wages, hours, and conditions of work, and the contractor is required to give a bond to the amount of \$10 for each machine operative. Following is a copy of the contract made with the tailors:

AGREEMENT WITH CONTRACTOR.

Articles of agreement made and entered into this — day of —, 1901, by and between — party of the first part, and — parties of the second part, by their attorneys in fact, to wit: United Brotherhood of Tailors, District Council No. 1, of the United Garment Workers of America, all of the city, county, and State of New York, witnesses:

1. The part— of the first part hereby covenant— and agree— to employ the parties of the second part as operators, basters, finishers, pressers, fitters, bushlers, and buttonhole makers, each in his own capacity, in the tailoring shop of the part— of the first part, at No. — street, New York City, borough of —, for the period of 1 year from date thereof.

2. In consideration of the premises, the parties of the second part hereby faithfully, skillfully, and diligently to perform the work of operating, basting, finishing, pressing, fitting, busheling, and buttonhole making, each in his own capacity for the part— of the first part, and further agree to accept wages hereinafter mentioned as the minimum scale, and are to work 59 hours each week, as herein-after specified.

3. It is also mutually agreed by and between the parties hereto, that the parties of the second part are to remain in the employ of the part— of the first part as long as they will remain members in good standing in the union above named, and that should the part— of the first part need other hands — shall employ only members in good standing in said union on the same conditions.

4. The part— of the first part hereby agree— to abide by the rules of said union as known in the trade, and to permit said union's representatives to enter — shop or shops for the purpose of enforcing said rules.

5. It is also mutually agreed by and between the parties hereto that the system of work shall be that known as week work only; that wages are to be paid weekly on the last day of each week's work, and not later than 5 p. m. of said day, and that the above-mentioned 59 hours of labor are to run as follows: First 5 days of the week, 10 hours per day, to wit, from 7 a. m. to 12 noon and from 1 p. m. to 6 p. m.; the last day 9 hours, from 7 a. m. to 12 noon and from 1 p. m. to 5 p. m., and under no circumstances shall the part— of the first part cause the parties of the second part to work any overtime. Work to be begun Sunday or Monday, according to the religious faith of the employees.

6. The part— of the first part hereby further agree not to employ any more than 1 helper to every 2 operators, and not more than 1 helper to every 2 basters, and not to employ any apprentices.

7. The following is the minimum scale of wages to be paid by the part— of the first part to each of the parties of the second part in consideration of the premises:

Operators, \$18 per week and upward; basters, \$15 per week and upward, finishers, \$12 per week and upward; pressers, \$13 per week and upward; fitters, \$12 per week and upward; bushlers, \$11 per week and upward.

8. It is also mutually agreed by and between the parties hereto, that the part— of the first part shall give to the parties of the second part a promissory note for — dollars as security for the payment of wages and for the faithful performance of the covenant of this contract.

9. It is also mutually agreed by and between the parties hereto that the parties of the second part may quit work during the so-called sympathy strike, provided that no new demand be made by them.

10. This contract shall be binding upon all the parties hereto and their legal representatives during the period of 1 year from date hereof.

In witness whereof the parties hereto have set their hands and seal the day and year first above written.

In presence of—

United Brotherhood of Tailors, District Council No. 1, of U. G. W. of A.

Similar contracts were made with the other locals of the district council.

A significant development of the foregoing demands upon manufacturers is the organization of the contractors to the number of some 2,500 and their counter-demands. The contractors' association being placed between the manufacturers' association and the tailors' unions, presents a most interesting problem in this seriously disorganized trade. The contractors are really in the position of a trade union of foremen paid by the piece, since the agreement of the manufacturers with the workmen regarding the scales of wages gives them in effect such a status. Being paid by the piece by the manufacturer, and the wages being fixed over their heads by agreement between the manufacturers and the union, it is all-important to them that the manufacturers should also agree upon the contract prices for which they shall be compelled to take out work. Such is the demand of their organization through the union which they effected. Since the contractors' side is not usually presented to the public, and since this version of the situation is necessary to an understanding of the whole, the following copy of the contractors' official statement is reproduced in full:

THE CONTRACTORS' VERSION—AN OPEN LETTER.

Since the last few years the clothing trade has been agitated by numerous strikes, the causes of which were not understandable to the general public. Every year the workers went out on strike, and apparently won all they demanded, yet a few months later would witness again the same outcry in the press—"Long hours and small wages."

This ignorance of the true state of affairs arises partly from the natural sympathy of the press and the public for the downtrodden "laborer," partly from the false and highly exaggerated statements of labor "leaders," partly because the contractors, in the public eye notorious sweaters, were denied the privilege of the press columns, and feared to denounce the wholesale manufacturer as the fountain head of all the evil conditions extant.

Did the manufacturer accede to the demands of the laborer, when forced by the fact that his customers were waiting the shipment of their orders, so that the contractors could satisfy their just and righteous demands, no sooner was the busy season over than the manufacturer again reduced the contract price so that of necessity the contractors were compelled to cut down the wages of their employees.

For these reasons, the contractor is to day loath to reopen his shop until the manufacturer shall have guaranteed to both workman and contractor to keep the terms of his agreement.

The statement of various labor agitators to the effect that the manufacturer will open inside shops and thus abolish the contract system, does not frighten the contractor. He well knows that the manufacturer is not in business from philanthropic motives. He knows that as long as he can make the work cheaper than the manufacturer himself, as is evident by the very fact of his existence, his position is not in danger. It is true that some manufacturers have a small part—the higher grades—of their work made up on their own premises, but this is only to throw sand in the public eye.

What the manufacturer loses here, and he undoubtedly loses, he more than recompenses himself for by grinding down the prices of the cheaper lines, which he gives out to the contractors. Since, then, the contractor is now between two fires, he wishes to show the public the true state of affairs and asks the manufacturer, who has his work made partly inside and poses as a philanthropist and friend of the workmen, not to give any more work to outside contractors.

The contractor wishes to show the workmen that he does not fare any better than they, so that they include in their demands of the manufacturer not only a 59-hour work week and a guarantee for their wages, but also such an advance in the contract price which will enable him to meet their demands, and then the contractor pledges himself to turn over this entire advance to the workmen's wage.

GAP KAIMES,

Secretary Clothing Contractors' Association.

Custom tailors.—The first organization of custom tailors in New York was formed in 1862 with 2,000 members. It has never been as prosperous as it was during the first years. At that time it succeeded in doubling the wages. The members were Irish and German, and these have predominated until the present time. The Swedes have been coming in for 20 years, but in 1894 they left in a body and formed a separate union of 600 members. Italians joined in 1891-92 during a strike, but left of their own accord when the strike was settled. The Italians work almost solely on ladies' tailoring. During the history of the union prices have been raised several times, and the price of \$14 for a sack coat in 1894 was much higher than in the early years. Neither the best tailors on Fifth avenue are in the union, nor the Jewish custom tailors on the east side. The Jews are never first-class custom tailors. Their field of activity is ready-made clothing.

Clothing cutters.—Among the clothing cutters in New York almost one-half are Jews, one-quarter Irish, one-quarter German. The unions include, perhaps, 1,700 members out of a total of 3,000. Wages in union shops and the best nonunion shops are \$18 per week, running as high as \$24. On East Broadway they are as low as \$6 to \$10 per week.

Organization of Jewish trades.—A central organization of all Jewish trades, known as the "United Hebrew Trades," was organized in 1888. Here the great questions of trades unionism and socialism were discussed and the ideas disseminated amongst the people. The labor movement among the Jews has been reflected in this council more than in any other single place, and it is there that new movements were usually inaugurated. The following list of organizations which now belong to the United Hebrew Trades shows the marked predominance of the clothing trades:

United Brotherhood of Cloak Makers, representing the 7 locals.

United Brotherhood of Tailors, representing the Coat Makers' organization, probably having 1,000 members.

Wrapper Makers' Union, who make ladies' cotton wear, having some 800 members, three-fourths of whom are women out of an entire number in the trade of about 2,000.
 Vest Makers' Union No. 2, with about 300 members, and No. 1, with about 300 members
 American Protective Musical Union, 50 members

 Salesmen's Protective Union, 18 members.
 Silk Waist Makers' Union, 650 members out of 2,000.
 Theatrical Costumers' Union, 650 members.
 Vest Makers' Hungarian Branch.

It was not until 1891 that the first attempt on the part of the tailors of the United States was made to organize a national body together with the clothing cutters. On April 12, 1891, representatives of some 18 or 20 unions, who represented the tailors of Boston, New York, Brooklyn, and Philadelphia, in all 47 delegates, met at Clarendon Hall, New York, and formed a national body, called the United Garment Workers of America, and decided to join the American Federation of Labor.

Union label movement—Attack on contract system.—At the present time the point of attack on the part of the labor organizations in the clothing trade is the contract system. It is claimed that all efforts toward bettering the condition of the tailor fail, mainly, because their so-called employers are middlemen, and not responsible. That they take advantage of the lack of work during dull times to destroy effectively their agreements with the unions. The national executive board of the United Garment Workers of America has resolved to use the label for the purpose of eliminating the contractor. On April 11, 1901, the following resolution was adopted:

It being agreed that the contract system made it extremely difficult to enforce the laws and control conditions, and as the members were preparing for a movement having for its object the abolition of the contract system, it was agreed as follows:

First, the label be granted to no more firms unless they agreed to do their own tailoring directly in their own shops.

Second, to grant the present firms using the label six months' time in which to comply with the above condition.

Third, labels not to be given to shops employing less than ten persons.

Fourth, no labels to be given to any shop until first inspected and reported upon favorably by the label secretary.

Voted to announce publicly the policy of the national union in regard to the contract system and to institute the same movement as soon as practicable in all other clothing cities.

The foregoing resolution was followed by a demand upon the manufacturers by the Clothing Trades Council of New York for the abolition of the contractor. Following is the resolution:

Whereas it has now become impossible for the average workman in the tailoring trade to earn sufficient to keep body and soul together, the strikes in the past having accomplished but little for the tailor because the competition among sweater contractors made it impossible for them to live to their solemn promises to the unions;

Whereas the tailor works in the shop wholly unsanitary; shops that were not whitewashed for years; shops where windows, floors, and toilets are never cleaned; shops that are transformed during the night into lodging houses—the clothing being turned into quilts, pillows, and beddings, breeding vermin; shops that are a menace and danger to the workman as well as to the consumer of the clothing there made;

Whereas in hundreds of cases the tailor suffers the loss of his toll, the sweater absconding with the hard-earned wages, and the tailor getting paid waits two or three weeks for his bare, miserable pittance, with the result that he works and starves;

Whereas contractors have ceased to be contractors, and have become mere tools of oppression, exploiting the hands;

Wherefore in consideration of the great evils aforementioned, be it

Resolved, That we, the representatives, delegates of all the tailor unions representing the local unions of New York, Brooklyn, Newark, and Brownsville, when the opportune time arrives, refuse to submit to the sweater, and we now notify all manufacturers in the clothing trade to establish shops under their own control and under their own supervision.

V. WAGE STATISTICS IN THE CLOTHING TRADE.

The main obstacle in the way of measuring the effect of immigration on wages over a period of years is the uncertainty of the wage statistics. The clothing industry is conducted in small shops where the employer carries his accounts in his head, and leaves the business as soon as he can or must, either by advancing to the position of

a manufacturer or returning to the position of an employee. It is practically impossible to find a contractor who has a set of books covering five or ten years, to say nothing of the past twenty years, during which immigration has been playing its part. In lieu of the contractors' books, the New York bureau of labor statistics, since the year 1889, has undertaken to secure information from the officials of labor organizations. The conjectural character of these statistics can be judged from the following example:

TABLE 12.—*Daily rates of wages as stated by labor organizations in the clothing industry from 1891 to 1895.*

[New York Bureau of Labor Statistics, 1896, pp. 738 ff. Selected occupations.]

The well-recognized fallacy of comparative average wages is especially apparent in the clothing trade. The following averages are taken from the reports of the New York Bureau of Labor Statistics:

TABLE 13.—*Average annual wages paid in the clothing trade, New York.*

[New York Bureau of Labor Statistics, 1896, pp. 78, 79.]

Year	Number report- ing.	Yearly average wages.
1891.....	22,622	\$384.26
1892.....	23,687	384.85
1893.....	26,100	392.67
1894.....	25,414	357.92
1895.....	30,979	361.77

The following table shows that the wages of operatives in clothing manufacture range from \$1 per week to \$60 per week. It shows also that even within a single occupation the range is as great as \$1 to \$15 (coat makers) and \$3 to \$50 ("tailors"). Plainly an average derived from such a wide range can have but little meaning.

TABLE 14.—*Rates of wages per week for all males.*

[New York Bureau of Labor Statistics, 1899, pp. 482 ff.]

	Per week.
Buttonhole makers.....	\$4 to \$18
Coat makers.....	1 to 15
Cutters.....	12 to 35
Finishers.....	6 to 7
Pressers.....	6 to 11
Tailors.....	3 to 50
Vest makers.....	3 to 12

MERCHANT TAILORS.

Basters.....	7 to 13
Bushelmen.....	8 to 19
Cutters.....	16 to 60

While average wages for the trade can not be relied upon, it is even questionable whether the reported wages of a single occupation over a period of 10 or 20 years can be relied upon. In the course of 20 years so many changes have occurred in the trade in the way of subdividing the work that a given occupation does not designate the same degree of skill as formerly. It is for this reason that the existing wide range of wages within even the same occupation is found. Consequently a comparison between the wages of a given class of workmen at different periods, compiled from different sources, must be taken with the caution that perhaps the compilers have not agreed upon the identical kind of work throughout the time covered. Probably the most satisfactory effort of this kind is found in the following table from the report of the Massachusetts bureau of labor statistics (1897. p. 5). This shows the

average weekly earnings for specified occupations for the years 1860, 1872, 1878, 1881, and 1897. Prior to 1880 the Jew and Italian had not influenced the trade materially, and, moreover, the trade had not developed largely its ready-made side. Comparing, therefore, the wages of 1881 with 1897 it appears that the wages of cutters and women custom workers on pantaloons and vests have risen, whereas the wages of overseers, cutters, trimmers, pressers, basters, home finishers, shop finishers, and custom finishers have fallen. The marked fall in the case of home finishers is the well-known result of Italian immigration. These comparative wages should be compared with the subjoined average wages, for the same years, of the 23 occupations compiled by the United States Department of Labor, which show a rise of 1.2 per cent during the same period—1881 to 1897.

TABLE 15.—Average weekly wages, ready-made clothing, standard gold.

Of even more importance than the movement in the rate of wages in the clothing trade are changes in the hours of labor and the exertion of the laborers. On this point statistical records are lacking, but it is a significant fact, as already stated, that in the "task" system as practiced in New York, whereas 15 years ago the task was 8 or 10 coats for 1 day's work, the task is now 20 to 22 coats of the same quality. Formerly the operator, baster, and finisher could complete their task in 8 or 10 hours of leisurely work; now it require 14 hours of intense application. On the basis of 12 hours' work it is generally found that the team can turn out only

5 tasks—i. e., 5 day's work in the week. The so-called "driving" is the characteristic of every sweat shop. Accepting the foregoing basis of 10 coats in the task compared with the present basis of 20 coats, and no changes in the method of production, the workmen do twice as much work for the same money, and since they work 2 to 3 hours longer, it follows that the exertion of the workman for the same amount of money has increased 20 to 40 per cent.

It is possible, however, that the overexertion can be traced as much to antiquated methods as to overcrowding the labor market. This point will be carefully examined in later pages of this report, wherein the task system is compared with the newly introduced "factory system." It is there shown that this factory system produces in 10 hours, at slightly higher wages, the same product that the task system produces in 12 hours. But, on the other hand, in the factory system, owing to the minute subdivision of labor, the intense exertion of the workmen is even greater than in the task system. On the whole, if we measure wages by the amount of his life energy which the workman gives up, it seems clear that in the past 15 years there has been a decided fall in the amount of return received for his labor.

Beginning with the year 1897, the New York bureau of labor statistics has compiled quarterly reports from the officials of labor organizations in the clothing trade, and by a system of subdivision of occupations and careful instructions to the officials has been able to present the most nearly accurate body of wage statistics that can now be found in the clothing trade. The following tables have been compiled from the reports of this bureau. They show for the 20,000 organized employees the number of days worked each quarter and each year, the average earnings per quarter and per year, the average earnings per day worked, and the average earnings per working day of the year. It should be noted that organized labor, which alone is represented in these reports, includes those employed in the better shops, with the shorter hours, higher pay, and more regular employment. Consequently the 20,000 employees covered by the tables indicate an average of the better conditions of the trade, while the remaining 80,000 or more are on a distinctly lower level.

It will be seen, taking the trade as a whole, that the average number of days worked each year ranges from 217 to 255 for men and from 228 to 272 for women. Allowing 310 days as the working period of the year, this represents employment of 70 to 90 per cent of full time.

The average earnings per year range from \$415.30 to \$580.78 for men and from \$245.28 to \$312.98 for women. The average earnings for each day worked range from \$2.04 to \$2.27 for men and \$1.07 to \$1.26 for women, and the average earnings per working day on the basis of 310 days per year, representing the amount of money available for daily living expenses, ranges from \$1.34 to \$1.87 for men and from 79 cents to \$1 for women.

The best-paid workmen are the cutters—earning from \$3.14 to \$3.29 for the days worked, equivalent to \$2.64 to \$2.72 for each working day. These include 5 to 10 per cent of the total number reported. Coat operators earned in 1897 \$1.78 per day, equivalent to 89 cents for each working day. Other occupations can be followed by consulting the table.

VL—MODES OF PRODUCTION AND RELATION TO NATIONALITIES.

The foregoing compilations of statistics are designed to present, as far as they go, the general or average conditions of labor in the clothing trade at different times. We have already mentioned the defects of method and inadequacy of data. There remains another method of study, that of individual typical shops. In the course of the past 25 years the changes in mode of production are as important as the changes in nationalities, and new modes have usually accompanied new nationalities. At the same time there can be found in existence side by side types of all the different shops and the different nationalities that have engaged in the business. Old methods and new methods are competing together, and also the remnants of earlier nationalities, with the vanguard of later nationalities. By studying these nationalities comparatively we can get, as it were, a contemporary epitome of the history of the trade. We can then draw our inferences upon the relative competing power of the several factors involved, especially those of immigration, women and children, and modes of production. In other words, as we find that one nationality or one mode of production has greater competing power than another nationality or mode of production, we can endeavor by a minute comparative study of the shops in question to separate the one cause from the other. After a careful study of some 150 shops in New York, Chicago, and Philadelphia, 12 have been selected as representative. These are described in detail in the following pages, and the accompanying comparative table (Table 31, page 344) has been drawn up showing the results reached in the later study of individual shops. This table should be referred to in following the discussion.

Only coat shops have been selected for detailed study, since this gives a uniform basis. The manufacture of trousers, vests, cloaks, etc., show similar comparisons, which have already been more briefly referred to.

It will be seen that the shops selected cover four modes of production: First, the journeyman tailor who makes the complete garment (No. A); second, the successor to the home shop (Nos. 7 and 8); third, the small shop (Nos. 1, 6, 7, 8, 9, 10, and 12); fourth, the large shop or factory (No. 2 and 11).

The shops also cover the two methods of employment, namely, the contract system (Nos. 1 to 10) and the direct employment by the manufacturer or "inside shop" (No. 11). There is also one shop, No. 12, which is a "country shop," all of the others being located in large cities.

The predominating nationalities represented among the employees are six: Jew (Nos. 1 and 2), Lithuanian (No. 3), Polish (Nos. 4, 5, and 6), Bohemian (No. 7), German (No. 8), Italian (No. 11). These are shops which may rightly be described as belonging to the nationalities named, although in all cases certain parts of the work are done by a few persons of a different nationality. But there are two shops (Nos. 9 and 10) where the nationalities are distinctly mixed, including Jews, Germans, Poles, Bohemians, etc.

Lastly, these shops are selected so as to exhibit men's shops (Nos. 1, 2, 3, 5) and women's shops (Nos. 4, 6, 7, 8). Here again only the predominating character is indicated, since certain parts, especially pressing, trimming, and busheling are always done by men, even in women's shops. By predominating character is meant the character of the employees upon the machine operating and the basting. There are also 3 shops which are mixed as to sexes (Nos. 9, 10, 11).

The comparative study of these shops is designed to show, as already intimated, the competing power of nationality, sex, and mode of production. In each case is given the contract price of the coat, which serves to identify the quality of work; the labor cost of the same and the time required to make the coat; the wages per hour for the entire shop and for each of the three leading divisions of labor, operating, basting, and pressing. Each schedule is also accompanied by a commentary, in which the several factories are analyzed and the different shops compared.

VII. THE TASK SYSTEM.

Accompanying the immigration of Jews, from 1876 to 1882, the remarkable "task system" was introduced in New York. This system produces at the present time perhaps one-half the coats made in that city. The task system is peculiar to the city of New York, where it originated and continues. It exists neither in other cities of the United States nor in other countries. It is peculiar, also, to the Jewish shops.

The task system was the first real division of labor in coat shops. It has a double characteristic. It is a "team," or "set" of workmen, and the wages are paid by the piece. The number of workmen in the set is 3: The machine operator, the baster, and the under baster or finisher. The pressing is usually done by a fourth man, who is not a member of the team. With such nicety has this system been adjusted, through the pressure of competition, that at the present time it is found that 1 presser can press more coats than 1 team can complete in a day; and, on the other hand, 2 teams can furnish more work than 1 presser can complete; consequently the standard shop in which four-fifths of the task work is done is that of the "3-machine" shop, i. e., the shop of 3 teams of operator, baster, and finisher, to 2 pressers. Sewing on buttons and tacking pockets is done by a girl working by the week. In many cases, originally, where the shop was small, the contractor himself was one of the team, but at the present time, with 3 teams, he is the fitter or bushelman. Each team, therefore, as will be seen from the schedule of Establishment No. 1, below, is composed of the following: 1 operator, 1 baster, 1 edge baster or finisher. To every 3 teams, 2 pressers. Two girls for sewing on buttons, tacking pockets, etc. One or 2 girls for filling armholes and bottoms, etc.

When the task system originated with the Jewish immigrants, about the year 1877, it took the place of the journeyman tailor in the ready-made work. The coat for which the tailor received \$5 or \$6 as custom work, and for which he received \$2.50 to \$3 in the dull season as ready-made work, was made in these Jewish task shops for \$1.50 to \$2. At this price the Jews earned as much and even more money than the merchant tailor. The latter made very little use of the sewing machine. Most of the work on the coat was done by hand. When the division of labor was introduced in the Jewish shops each particular division became a trade in itself. The machine operator did not know how to do pressing or basting, the presser could not do the work of the others, and so on. The sewing-machine operator now became an important factor in the trade. He was able to do many parts of the work by machine that were formerly done by hand, and as a result the coat was made much quicker. Then again, the men who were engaged only in basting were able to do their work much quicker and probably better. The same was true of the presser and finishers.

In addition to the division of labor, the characteristic of the task system as distinguished from a piece system consists in the fiction that the workmen are earning a standard amount of wages per week. The scale originally fixed upon, and adhered to at the present time, was \$18 for the operator, \$16 for the baster, and \$7 to \$9 for the girl edge baster or finisher, or \$11 to \$12 for the man edge baster who has latterly taken the girl's place. Starting out upon this basis, it was found, 20 years ago, that a team could complete 8 or 9 cheviot coats per day, with plain seams and with welts on the outside. At this rate the price per coat for the team was about 80 cents. The present price is only 28 to 35 cents.

The process by which the price of labor was reduced, following the great influx of Hebrews in 1882, was somewhat as follows: The contractor, who was, perhaps, himself a member of the team on a kind of cooperative basis with the others, would go to the manufacturer and ask for work. Finding that there was but little work to be had, he would offer to take the coats cheaper than the price theretofore paid. When he came home, he would tell his men that there was not much work and he was obliged to take it cheaper, and, since he did not want to reduce their wages and pay them less per day, all they would have to do would be to make another coat in the task. That is, if they were accustomed to make 9 coats in the task, they would be required to make 10, then 11, and so on. The wages were always reduced on the theory that they were not reduced at all, but the amount of labor increased. In this way intense speed was developed. The men who had been accustomed to making 9 coats in a task would make 10, and so on up to 15, 18, and even 20, as is the customary task at the present time. The hours began to be increased, in order to make the task in a day. Within the last 3 years it is said by the men that it is only in very rare cases that a set can make a task in a day; that it is usual for these sets of 3, even when working 12 or 13 hours per day, to make only 4 or 5 tasks in a week. In previous years, they claim, men were able to make 7 and 8 tasks or days' work per week.

This increased number of coats per task probably explains why, in the evolution of the trade, women could not hold their own as edge basters and finishers. About 1,500 to 2,500 girls have been driven out and men have taken their places at wages 50 per cent higher. This is because both the hours and the speed were increased continuously so that women were physically unable to perform the task.

The task system, it is said, has two advantages: The men work substantially by piecework and have a personal inducement to perform their work as quickly as they can, and, since they are in a team, each has to keep up with the others, so that a higher speed by anyone induces higher speed by the other two. So nicely are the members of these teams adjusted to each other that frequently a baster or an operator is out of work because, for the time being, he can not find the other two members whose speed is exactly fitted to his. By this queer cooperative production in the form of team work, combined with the personal interest of piecework, the Hebrew tailors in New York have devised what is, perhaps, the most ingenious and effective engine of overexertion known to modern industry.

One reason why piecework and high speed have become the framework of the contractors' shops is probably because the Jewish people are peculiarly eager to earn a big day's wages, no matter at what sacrifice. The Jewish workman is willing to work very hard for this, and does not want to have it said that there is a limit to his earning capacity. It is the desire of the Jew to have his employment so arranged that he can speculate and bargain upon his earning capacity, and can make use of the seasons. Piecework gives him that opportunity. In a rush season he will demand a decrease in the number of coats to the task, making more tasks per week and consequently earning higher wages. If the work is slack and the number of coats in the task is increased, he will speculate upon his ability to work harder and still earn high wages. Usually he is anxious to accumulate money and open up a contractor's shop for himself, or go into some kind of business. It is not for love of hard work nor because of lack of other enjoyment that the Jew is willing to work so hard, but for the sake of getting rid of work. At the same time it is true regarding green immigrants of all races that the conditions of a strange land stimulate them to the hottest exertion of which they are capable. The Jewish immigrant is peculiar only in that he is not by nature a wage-earner, and he keeps before himself continually the goal of emancipation from hard work.

This characteristic of the Jew shows itself in his irritation under the discipline of the factory. He is willing to work long hours, but does not like to have anyone dictate the time when he shall begin work or stop work. He does not like to be driven nor have his attention called to the fact that he has not made much work. He wants to have freedom. This he usually has in the contractor's shop. He is very nearly "his own boss;" he can smoke, talk, run around, stay at work an hour longer, come in an hour earlier, or come later. The conditions of sweatshop employment which favor this are piecework, with an almost complete absence of factory regulations and factory management. The contractor's shop is a sort of ideal worked out by this

individualistic people, which holds out a fair hope to everybody of some day becoming his own boss, and, to a certain extent, of being his own boss while still at work in the shop. It is mostly from the employees of the contractors' shops that the contractors themselves are recruited, and it is from both the employees and from the contractors that the better class of help in the clothing trade, such as designers, is recruited. It is also from these same people that the small clothing manufacturer starts out, building his trade up until he becomes a large clothing manufacturer.

Following is the schedule, in detail, of a typical shop of the task system. In explanation of this schedule it is necessary to describe the usual method of figuring the contractor's interest in the amount of work done. It is as follows:

Out of not less than \$15 worth of work, which the contractor takes out from the manufacturer, he pays \$3 to the operator; \$2.66 to the baster; \$2 to the finisher or edge baster. In addition to this he has to pay for sewing on buttons, felling armholes and bottoms, tacking pockets, trimming the coat and pressing, expressage, rent, oil, and repair for machines, etc.

The pressing is usually done by the piece, at the rate of 8 cents per piece for a 75-cent coat; the presser would get \$1.60 to \$1.80 out of the \$15.

The women who fell the sleeves, at home, usually would get 80 cents to \$1.

The busheling, trimming, and fitting is usually done by a man, who gets from \$12 to \$15 per week, working at the rate of 4 to 6 cents for a 75-cent coat, or 80 cents on the \$15 worth of work.

The girls who sew buttons on, in the shop, usually get from \$4 to \$7 a week.

TABLE 32.—*Cost and profit of contractor, on task system.*

[Per task of \$15 worth of work.]

Operator	\$3.00
Baster	2.66
Edge baster	2.00
Presser	1.00
Sewing on buttons and tacking60
Felling80
Fitting and busheling	1.00
Buttonholes48
Expressage30
Total	12.44

Leaving a profit of \$2.56 on each task. With three sets the balance would be \$7.68 per day, and for 4½ days' work per week, \$34.56. Out of this the contractor must pay about \$6 rent per week, and \$3 for oil and repairs, leaving a net profit for the week of 4½ days of \$25.56.

ESTABLISHMENT No. 1.

While the task system displaced the journeyman tailor in the manufacture of ready-made coats, it has itself in the past 5 years met a competitor in the factory or large shop, described below as establishment No. 2. In this contest the task system appears to be antiquated and uneconomical. During the 25 years of its existence in New York it shows no material change. The division of labor is but slightly different from what it was originally. We now have the operator, baster, and edge baster or finisher, with a helper or two in each branch of work, just the same as formerly, except that the edge baster or finisher is now a man, while originally this work was done by women. But the task itself, instead of being 8 or 10 coats, is now 20 to 24 coats. The workmen make up in overexertion what they lack in shop organization and division of labor. The team system lacks elasticity and the power of expansion. The division of labor can go no further than to pass the coat through the hands of not to exceed 9 or 10 persons. If the shop grows in size the growth is not organic—it is segmentary. It can not add a man here and a girl there, but must add an entire team—in fact, it must add 3 teams in order economically to adjust the work of the 2 pressers.

There has, indeed, been a cumbersome attempt during the past 10 years to introduce a further division of labor in the task system. It consists in a curious reduplication of the team. The operator in the original team becomes the first operator, who does the parts requiring more careful work. He takes with him another man, called "two-thirds of an operator," who does operator's work requiring less skill, and who is paid two-third wages, and still a third man, called "one-third of an operator," who does the least skillful work and gets one-third pay. The same three-fold division is made for the basier and edge baster, so that there is also a "whole baster," a "two-thirds baster," and a "one-third baster." A shop of this kind is called, not a three-team shop, but a "two-team" shop, since it requires a whole man plus a two-thirds man plus a one-third man to make two "whole men." This awkward subdivision is not making headway, but the entire task system is yielding to the more elastic and organic factory system.

VIII. THE FACTORY SYSTEM.

Quite recently what may be described as a factory system has been introduced in a few establishments in New York. This is known in the trade as the "Boston system" in order to distinguish it from the task system which is peculiar to New York. It is not really a "Boston system," since it is found also in Philadelphia, Chicago, and elsewhere, but it has been slow to gain a foothold in New York because the task system has met it by its unique capacity for overexertion. Now that it has been introduced on the basis of New York's wages and standards of exertion those contractors who have adopted it are confident of its future. The "factory" employs 50 to 200 persons, where the task system employs 10 to 20. It has a minute division of labor and an elasticity of expansion far beyond that of the task system. The following schedule of Establishment No. 2 represents this system. This is a shop employing 104 people and making 1,650 coats per week, at 75 cents each.

ESTABLISHMENT No. 2.

[Factory system: New York; coat shop; steam power; contractor, Jew; employees, Jews and Italians; 104 employees in one system; 1,650 coats per week; 60 hours per week; system introduced about 1897.]

This particular shop, chosen as establishment No. 2, has been selected because it is known in the trade throughout the country as able to produce the cheapest coat of this kind. It is claimed by competing contractors in New York and other cities that contractor No. 2 enjoys his superiority because he employs immigrant labor and gets it very cheaply; but it can safely be said, after a careful examination of the trade in general, that the better grades of labor on this grade of work are paid more per hour in this shop than any other place in the country. Also, the employees are working 10 hours a day instead of 12, 13, and 14 hours, as is done in competing shops. As regards the employing of immigrant labor, contractor No. 2 employs labor that has probably been in this country longer and has had better training than the majority of the trade outside. The advantage which this establishment has over other shops is in the mode of production. With its minute division of labor, skilled labor is employed where skill is required, and unskilled labor where less skill is required.

The labor cost on a coat, on the basis of 10 hours' work a day, in establishment No. 2, is 55.7 cents. The labor cost on a coat in establishment No. 1, where the division of labor is not so minute, is 59.3 cents, giving No. 2 an advantage of nearly 4 cents.

The time required to make the coat in establishment No. 2 is 3 hours 41 minutes, as compared with 3 hours 55 minutes, in the case of No. 1, giving No. 2 an advantage of 14 minutes per coat.

If the wages are compared in their several divisions it will be found that the average earnings of operators in establishment No. 2 are 20.1 cents per hour, working 10 hours per day, or \$12 per week; while in establishment No. 1 the operator earns 20.9 cents per hour, working 12 hours, or \$15 per week.

But establishment No. 2 has 26 operators of widely different skill, whereas the operators in No. 1 are of equal skill. We should compare the operators in No. 2 who are of the highest skill with those in No. 1 whose skill is the same. In doing this we find that out of the 26 operators in No. 2 there are 7 men who earn \$15 to \$17 a week, working 10 hours a day, while in establishment No. 1 the operators of the same skill are working for \$15, 12 hours per day. There are also in No. 2 two men at \$14 a week, working 10 hours per day, making their wages per hour higher than the men who work 12 hours a day for \$15 a week in No. 1. Even the 2 men on the schedule who earn \$12 a week each are earning about the same wages per hour as the best in establishment No. 1.

The same thing holds true with regard to the baster. The baster in establishment No. 1 gets on an average 18.4 cents per hour, working 12 hours a day, amounting to about \$13 per week, while the baster in establishment No. 2 gets 15.1 cents per hour. But in the case of No. 2 the baster includes the edge baster also on the basis

of 15.1 cents, while in No. 1 the edge baster gets only 13.8 cents per hour; so that if in establishment No. 1 the baster and the edge baster were combined and an average drawn as in No. 2, it would be found that the basters get about the same amount in both cases. When the wages for the baster are computed it will be found that in No. 2 there is one man who gets \$14 a week, working 10 hours, while the skilled baster in establishment No. 1 gets only \$13 a week, working 12 hours a day.

With regard to the edge baster or finisher we find that in the case of No. 1 the skilled finisher works 12 hours a day in order to earn \$10 a week. In establishment No. 2 there are 2 skilled finishers who get \$10 and \$12, working only 10 hours a day, and others at \$9, \$8, and \$7, while there are 2 at \$8 a week who earn per hour about the same and even a trifle more than the skilled basters in establishment No. 1.

But the output of the basters is about 60 per cent greater. The basters in establishment No. 2 baste a coat in 54 minutes as against 86 minutes in No. 1. Consequently, while establishment No. 2 pays even better wages for skilled labor than does establishment No. 1, and requires the employees to work only 10 hours per day, as compared with 12 hours in the latter case, they are able to produce a coat cheaper than establishment No. 1. On both the question of wages for skilled help and the question of time consumed per coat No. 2 has the advantage.

In view of the counter argument which would naturally suggest itself that, granting establishment No. 2, with its factory system, pays higher wages to a few extra-skilled employees, yet this is likely to be counterbalanced by the larger proportion of cheap help, the following comparison is offered: Taking an average wage of \$9 per week as the dividing line between cheap help and skilled help, and calling those who receive \$9 and less per week the cheap help and those receiving over \$9 the skilled help, it will be seen from the schedule that establishment No. 1 has 9 employees, or 47 per cent of the whole number, receiving more than \$9, and 10 employees, or 53 per cent of the whole number, receiving \$9 or less; and establishment No. 2 has 48 employees, or 46 per cent of the whole number, receiving over \$9 per week, and 56 employees, or 54 per cent of the whole number, receiving \$9 or less per week. In other words, in establishment No. 1 53 per cent of the employees are cheap help, and in establishment No. 2 54 per cent of the employees are cheap help. The proportions between skilled and cheap help in each establishment are practically identical.

The reasons for the cheaper cost of production and the better conditions in establishment No. 2 are to be found in the greater skill and speed acquired where the labor is minutely divided. A man who makes only pockets can make more pockets and better pockets than the man who makes a whole coat, and moreover he can do this without the basting required by the latter, thus reducing the time and cost of the operation. As a consequence the pocket makers in the large shops earn about \$16 per week working 10 hours a day, while the first-class skilled operator in the small shop will have to work 12 hours per day in order to make \$15 per week. The same thing is true with regard to the man who sews around coats or stitches coats. More efficiency and skill are acquired by doing one thing, and higher wages are earned, even though working a less number of hours per week.

It is generally claimed in the trade by people who are running large shops like No. 2 that the only advantage which the small contractor has over them is in running his shop for unlimited hours. It will be seen from the schedule that this idea is verified in figures. Establishment No. 2 pays as good and even better wages than No. 1, and produces a coat in less time and at less cost per coat with 10 hours work, than No. 1 with 12 hours a day. If the labor of all shops were limited to 10, either through the strength of a labor union or through legislation, the following would probably be the result: Shop No. 1 would be compelled to increase the wages of its employees 20 per cent in order to enable them to earn the same wages in 10 hours that they now earn in 12 hours. This, on the assumption that the intensity of exertion would not be increased, would increase the cost of the operating and basting 20 per cent. This assumption is not wholly valid, because, with increased energy, owing to shorter hours, the increased cost would not be quite as great. The present cost of operating and basting is 46.3 per cent per coat, and an increase of 20 per cent would be 9.3 cents. Even now shop No. 2 has an advantage of 5 cents on a coat, and an increase of 9.3 cents would bring the advantage up to 14.9 cents per coat. With such a difference, or even with less difference in the cost of production, the task system would disappear before the factory system.

A probable reason which may be mentioned why shops of this kind have not come into the trade more largely is that the Jews do not submit graciously to this form of production. Establishment No. 2 must enforce discipline; everybody must be on time. There is not as much freedom as in the small contractor's shop. Many Jewish operators, basters, and edge basters would prefer to work 12 hours a day in a shop where they could have freedom than 10 hours in a shop where discipline is an essential part of the mode of production.

Another reason why establishment No. 2 has not developed further is because of the amount of money required to establish it. The contractor who can save \$2,000 usually invests it in the manufacture of clothing himself. He claims that there is not much money for the contractor who is working for a clothing manufacturer, but there is money in manufacturing for oneself, even on a small scale, utilizing the labor of the small contractor. Consequently, contractors, instead of investing their money in larger contractor's shops, have made a practice of beginning to manufacture clothing themselves on a small scale. There has, indeed, been a number of large manufacturers who have established just such shops as establishment No. 2, known as "inside shops" to distinguish them from the contractors' shops. But it seems that a manufacturer can not produce a 75-cent coat in the large factory quite as cheaply as the contractor can produce such a coat in the large factory. A hired superintendent is not usually able to obtain as cheap results as those obtained by a skillful contractor. But in these large inside shops a better grade of coat, costing \$1.50 to \$3, is made to great advantage, while the 75-cent coat (and the great majority of coats are from 62½ cents to \$1) is made in shops of the class of establishment No. 1. Probably 50 per cent of the 75-cent coats are made in shops of this class and the rest is distributed through other shops, leaving probably not more than 5 per cent of the 75-cent coats in establishments like No. 2.

Establishment No. 3 is a Lithuanian shop in Brooklyn. The people employed in this class of shops number several hundred. The mode of production is quite similar to that in the Jewish task-system shop. Indeed, the Lithuanians probably learned their peculiar division of labor from the Jews. They came from the same localities in Russia, and a number of them speak the jargon of the Jews. Like the shop described in schedule No. 1, which makes almost the same class of work, the Lithuanians have an operator, a baster, and an edge baster or finisher, in teams. They work with steam power, in shops of 10 machines and more. The earnings are divided in about the same way as in the Jewish shops, except that the contractor gets a smaller share. Out of \$15 worth of work the operator gets 25 per cent, or \$3.75; the baster gets 34 per cent and pays, in turn, the edge baster or finisher 40 per cent, so that out of the \$15 worth of work the baster gets \$3.06 and the edge baster gets \$2.04. Together the operator, baster, and finisher get \$8.85 out of the \$15 worth of work, instead of the \$7.66 received by the team in the Jewish shop. Therefore the labor cost on a 75-cent coat is 67.5 cents instead of 59.3 cents, leaving the contractor a balance of 8 cents, instead of about 15 cents in the case of the Jewish shop.

Probably the reason why these Lithuanian contractors can manage on 8 cents instead of 15 cents is because their shops are usually larger, having 10 or more machines instead of 3.

Notwithstanding the smaller share of the contractor and a piece price per coat 14 per cent higher than that of the Jewish team in the task shop of establishment No. 1, yet the Lithuanian earnings are smaller than those of the Jews. This is partly because the Jews work longer hours and partly because they are quicker and more intense in their work. The Lithuanians are mainly large and robust men, but are not so well adapted to the rapid and artistic kind of work required in the sewing trade.

The Jewish operator is able to make a coat in 43 minutes, while the Lithuanian operator requires an hour to make the same coat, so that while the price for labor paid to the Lithuanian is higher, yet, since he works so much slower, his earnings are less. In the Jewish shop the operator earns \$15 per week, working 12 hours per day, as against the Lithuanian operator \$11.22 for 10 hours' work.

The same facts are true with regard to the baster and edge baster (or finisher). In the Lithuanian shop it will be seen that the baster receives 13.6 cents per hour, while the baster in the Jewish shop earns 18.4 cents per hour. The Lithuanian edge baster earns 9.2 cents per hour; the Jewish edge baster earns 13.8 cents per hour. The earnings of the presser are about the same in both shops, although the Jewish presser, who works by the piece, gets a somewhat smaller percentage than the Lithuanian, who works by the week. Pressing requires a good deal of hard physical labor and less skill than operating or finishing, and although the Lithuanians, who are stronger than the Jews, get a higher price per piece, yet they earn about the same wages per week.

Comparing the wages on the basis of 8 months worked during the year, it will be seen that when the Lithuanian machine operator earns \$11.20 a week while working 10 hours a day, or \$387.96 a year, his average weekly wages for the year are \$7.46. The Jewish operator in establishment No. 1, on the other hand, while working 12 hours a day, earns \$15 a week. On the basis of 8 months worked during the year he earns an average of \$10 per week or \$520 per year. But making a comparison between the two nationalities on the basis of a 10-hour day, it is seen that the Jewish operator under the task system working 10 hours per day earns \$12 per week, in contrast to the Lithuanian who earns \$11.20. This shows a difference in the earning capacity of the two nationalities of 7.25 per cent in favor of the Jewish operator. When, however, the element of time is introduced, the difference is more pronounced. The Jew, working 12 hours instead of 10, or an increase of 20 per cent in time over the Lithuanian, earns \$520, or \$10 a week, in contrast to \$387.96, or \$7.46 a week, which is an increase of 34.03 per cent. In other words, the two nationalities, working the same number of hours on virtually the same kind of work, show a difference in earning capacity of 7.25 per cent in favor of the Jewish workman. But the Jew, by working 20 per cent longer, is able to earn 34.03 per cent more than the Lithuanian.

The same difference between the nationalities is brought out in an examination of the basters. The Jewish baster in establishment No. 1 earns \$13 per week when working 12 hours a day, or \$10 a week for a 10-hour day. The Lithuanian baster in establishment No. 3 earns \$9 per week on the basis of 10 hours. In the same class of work and for the same time there is thus a difference of 11 per cent in the wages earned, in favor of the Jew.

Introducing the element of time, the difference is more marked. By working 12 hours per day instead of 10, or an increase of 20 per cent, the Jew earns \$13 per week or \$450 per year for 8 months, and \$8.66 per week for the year, which is a net increase of 44.33 per cent over the earnings of the Lithuanian.

The difference is further brought out in comparing the finishers or edge basters in the Jewish shop the earnings per week for a 12-hour day are \$10, or for 8 months \$346.32, and an average of \$6.66 for the year; while for a 10-hour day they are \$8 per week. The difference in earnings between these nationalities, taking the 10-hour day, is, then, 32.36 per cent in favor of the Jew; while taking the Jew on the basis of the 12-hour day, in comparison with the 10-hour day of the Lithuanian, the difference in earnings is 65.70 per cent in favor of the Jew. The presser, getting \$11.20 a week, or \$388 per year, will average during the year \$7.46 per week.

It will be seen that this Lithuanian labor, while receiving per coat 14 per cent higher piece price, is able to earn less wages per week, showing that cheap labor is not really cheap in all cases. This Lithuanian team system, while it suffers in comparison with the Jewish team system, suffers still more in comparison with the factory system. It represents but a remnant of the clothing manufacture and must necessarily disappear before the greater economy of a more minute subdivision of labor. It must be added that the majority of these men receiving \$1 to \$7.46 per week for the year are married men, living in a large city, with families to support.

ESTABLISHMENT No. 4.

[Factory system—Chicago—coat shop, steam power, contractor, Jew, employees, Polish women and girls, 32 employees in one system, 400 coats per week, 60 hours per week, system introduced about 1892.]

Establishment No. 4 is the shop of a Jewish contractor, employing in the main Polish female help. It is this class of shops that are the most formidable competitors in the trade in Chicago. Contractors who have entered this business, employing this class of help, have been quite prosperous.

If schedule No. 4 is compared with schedule No. 1 it will be seen that the labor on a coat is 58.4 cents as against 59.3 cents in the task shop, and it has an advantage of less than 1 cent per coat. Probably even this advantage is offset by the difference in the quality of the coat. The Jewish operators and basters are better trained and the coats made in the Jewish shops are on the whole more artistic and have a better appearance.

Comparing the different divisions as to the price of labor it will be seen that the advantage is rather on the side of establishment No. 1, with Jewish help. The cost of operating in the case of No. 4 is 23.7 cents, while in the case of No. 1 it is only 15 cents per coat.

The time required for operating in establishment No. 4 is 1 hour 40 minutes, but the time required for operating in establishment No. 1 is only 43 minutes. The principal saving in No. 4 is in the basting, and as it is the basting that indicates quality, this saving is somewhat effected at the expense of quality. The cost of basting in the case of No. 1 is 23.3 cents, while in the case of No. 4 it is 13.9 cents.

When the wages and income of No. 4 and No. 1 are compared, it will be seen that the advantage is in favor of the Jewish shop. In No. 1 the operator will earn per hour nearly 21 cents, while in No. 4 she will earn only about 13 cents.

The baster in No. 1 will earn per hour 18 cents, while in No. 4 the baster will earn only about 13 cents. The Jewish task shop has the advantage both in wages and in cost per coat, considering the quality, compared with the factory system employing girls, even though the latter are good, steady help working for small wages.

But when establishment No. 4 is compared with establishment No. 2, the advantage is on the side of No. 2, namely, the Jewish shop employing men under the factory system. The difference is about as follows:

Comparison of establishments Nos. 4 and 2.

Establishment.	Labor cost per coat.	All employees.		Operator.		Baster and edge baster.	
		Average wages.	Time per coat.	Average wages.	Average time con- sumed.	Average wages.	Time con- sumed.
No. 4	Cents. 58.4	Cents. 12.2	h. m. 4 48	Cents 13.2	h. m. 1 40	Cents 13.1	h. m. 1 03
No. 2	55	14.7	3 41	20.1	57	15.1	54

Establishment No. 2, therefore, has the advantage at every point, showing that while the labor of women is cheaper per hour and per week than that of men, the labor cost on a garment is less in the shop employing men, even when paid almost double the wages paid the women. This will be further shown in a number of cases as the schedules are followed up. The reason why the contractors employing Polish women have been able to crowd out the shops employing Jewish men in Chicago is

probably because these contractors first introduced the factory system rather than because they employed Polish women. It was the factory system and not the Polish women that threw the Jewish shops out of business, and when the factory system was introduced in a Jewish shop the Jewish operator and baster, even at much higher wages, evidently can hold their own in competition and can produce a coat just as cheaply as can be done with female labor.

The characteristics of the Jews already mentioned will partially explain why they permitted themselves to be driven out of business rather than establish the factory system. They prefer work in the small shop so as to avoid the discipline which naturally accompanies the large factory. There is a change now taking place in Chicago in the large shops where Jews are employed, and the division of labor being introduced in the better grades of work.

Probably another reason why the Jews and Bohemians have been driven out and replaced by Poles is because both the Jews and Bohemians were given to forming unions and going on strikes and insisting on their price for labor. The Poles have worked while the others were on strike, so that clothing manufacturers encourage very strongly the Polish shops, even while they were learning the trade, so as to successfully defeat the tailors' unions.

Establishment No. 5 produces what is probably the cheapest lined coat in the United States, namely, a coat trimmed, stitched, pressed, felled, buttonholes made, and buttons sewed on and ready for the customer, for 19 cents. The cost of production on this class of goods has fallen more than in any other branch of clothing manufacture, the present contract price being 19 cents compared with a price of 40 to 45 cents 10 years ago.

The striking characteristics of this shop are its minute division of labor and the amazing speed of the workmen. Each man does one particular kind of work, in which he develops great skill and high speed. It is possible for the operator to do fairly good work without the help of the baster. Consequently the cost of basting each coat is only one-half cent, compared with 23.3 cents in the task shop No. 1, and 13.7 cents in the factory shop No. 2. The baster's time is only 2.6 minutes, compared with 43 minutes in No. 1 and 54 minutes in No. 2. Of course, this elimination of the baster depreciates the quality of the coat, but it is compensated to a remarkable extent by the increased skill of the operator.

The entire time required for a coat is only 1 hour 6 minutes, compared with 3 hours 55 minutes in No. 1 and 3 hours 41 minutes in No. 2. The total labor cost is 16.1 cents, compared with 59.3 cents in No. 1 and 55.7 cents in No. 2.

Immigrant and green labor can only come into this shop partially, since it requires trained men to keep up the speed that has been developed. More actual work per hour by the individual is incorporated in a coat in this shop than in any other class of shop. Polish men operators have here developed equal, if not greater, speed than Jews are able to develop under similar conditions.

The Poles before immigrating to this country were farmers. They came from more robust stock than the Jews and their endurance is greater. When once they become a part of this machinery they develop enormous speed.

If we examine the wages we shall find that the average earnings per hour are but little less than the earnings in those shops which produce a better class of goods. The earnings per hour are 14.7 cents, compared with 15.1 cents in No. 1 and 14.7 cents in No. 2, which make 75-cent coats, and 11.8 cents in No. 11, which makes a \$1.43 coat. These comparisons, however, are not quite parallel, since on the 19-cent coat there is more operating proportionate to the total cost than on the more expensive coats. If operators alone are compared it will be seen that these Polish operators receive 17.6 cents per hour, whereas the Jews in No. 1 receive 20.9 cents, and in No. 2, 20.1 cents. By the week the operators receive \$7.50 to \$17, the majority getting \$10 to \$12. The cheap cost of production does not result mainly from low wages compared with other shops but from a minute division of labor, steam power, and great skill and speed.

Establishment No. 6 employs female Polish help doing the main sewing and basting and produces the cheapest coat of that class of work that is made in Chicago.

If we compare this establishment with No. 5, a shop doing similar work and employing the same nationality, but employing men instead of women, we shall see that the men have the advantage in cheapness of production. In establishment No. 6 the cost of operating is 10.3 cents while in No. 5 it is 9.6 cents. But there is even a greater advantage than can be seen from these figures, since No. 6, employing women, can not make the coat without basting, and the basting for the 350 coats costs about \$11. It costs No. 5, employing men, almost nothing for basting, as all the work is done by machine. Yet the average wages of the men operators (17.6 cents per hour) are more than double the wages paid the women in establishment No. 6 (7.5 cents per hour).

The time consumed in operating a coat in establishment No. 5 is only 33 minutes, while with the women operators in No. 6 it is 1 hour 24 minutes—more than twice as much. If the time which is required for basting on this same grade of coats is taken into consideration the difference would be much larger. Consequently, while the girls work for less than half the wages the men receive, their cost of production is about one-third greater.

The average wages for the whole shop in the case of No. 5 are 14.7 cents per hour, while in the case of No. 6 they are 8.9 cents per hour. But the cost of producing the coat is 16.1 cents in No. 5 as against 26 cents in No. 6, showing that where men and women are of the same nationality, working the same number of hours, in each instance with machines propelled with power, the men are able to produce coats for nearly 40 per cent less than the women.

If establishment No. 6 is compared with establishment No. 4, both employing women, Polish shop No. 4 producing a 75-cent coat and Polish shop No. 6 producing a 30-cent coat, it will be seen that in No. 4 the wages are on an average 12.2 cents, while in No. 6 they are 8.9 cents, a difference of more than 3 cents per hour in favor of No. 4. This is probably due in the main to the fact that the help in No. 4 are more skillful and are working on a better grade of work.

It will also be seen that while there is a difference of 3 cents per hour between No. 6 and No. 4, due principally to the differences in skill, yet when two shops employing men are compared, namely, the shops making the 19-cent coat and the 75-cent coat, the average wages for the employees on the cheap coat and on the good coat are about the same, namely, 14.7 cents. This shows that men, by developing greater speed, can earn very nearly as much wages on cheaper grades of coats as they can on better grades of work, where it is not possible to develop such intense speed.

It is thus seen that in cheap coat making the enduring ability of the men is an important factor, and makes them able to compete successfully with female labor at cheaper rates. It is also true that the men stay at the trade longer and develop a capacity to work automatically, while women usually leave the trade after working 5 or 6 years.

Establishment No. 7 represents a shop where Bohemian girls are employed as edge basters and machine operators and men as first basters and pressers. There is quite a large colony of these shops in Chicago, employing probably 5,000 people, making the better class of ready-made coats at 87½ cents to \$1.25 for sack coats, and \$1.25 to \$2 for overcoats. The majority of them are small shops, with two or three machines, and not a very minute division of labor. From 12 to 20 people are employed, as a rule. It seems that these shops are not able to hold their own in the trade; they are successfully replaced by the shops employing Polish help, and also by the large shops employing the factory system.

It will be seen from the schedule that the time for a \$1 coat is 6 hours and 30 minutes, as against 4 hours and 48 minutes for the 75-cent coat in schedule No. 4; showing that it takes the Bohemians a longer time relative to the rate of wages than it takes this factory shop. They are also insisting upon somewhat higher wages individually than the Poles. The Bohemian operators insist on getting 15.5 cents per hour, whereas the average wages of the Polish operators is 13.2 cents, and their ability to produce is greater than that of their Bohemian competitors. Gradually, therefore, the Bohemian girl is being crowded out by the Polish girl.

The same is true in the case of the baster. The baster in the Polish shop gets 13.2 cents per hour; in the Bohemian, 15.8 cents per hour.

With regard to the time required on a 75-cent coat, the Polish baster requires 1 hour and 3 minutes, while on the \$1 coat the Bohemian requires 3 hours; showing that the ability to produce is much less in the shop where an intense division of labor is not employed than it is under the factory system with Polish help.

There is a tendency on the part of these Bohemians to go into the "special-order" trade, which has been quite largely introduced in Chicago, and so to put their ability into a calling where skill is required, and where, in the nature of things, the labor can not be so intensely divided as can be done in the manufacture of ready-made clothing. But even in the special-order trade the large shop, as will be seen in establishments 9 and 10, is successfully driving out the small shop.

What has been said with regard to the Bohemian shop holds good even in a better grade of work. Establishment No. 8 is a German shop, run by gas power, but is a small shop in the rear of a tenement house. The power has probably been introduced because the German girls are not willing to run sewing machines by foot power, as the Bohemian girls and Jewish men do. But the production is on a small scale, and the labor is not very much divided. It is said in the trade that these shops are being crowded out by the larger Polish shops, where the girls are more willing to "drive" their work.

It will be seen that it takes No. 8 12 hours and 48 minutes to make a \$1.75 coat. Comparing the unit of time with the price of the product, it is seen that more time is required to every unit of price than in establishment No. 4, employing Polish girls. For example, it takes an operator 4 hours and 1 minute to operate a coat, and the baster 4 hours to baste a coat. But in establishment No. 4 it takes the operator only 1 hour and 40 minutes to operate a 75-cent coat, and the baster 1 hour and 3 minutes to baste a 75-cent coat. It will be seen, by taking into account the difference in quality, that the advantage is on the side of establishment No. 4.

The average earnings are on the side of No. 4. The operator in No. 4 earns on an average 13.2 cents an hour, while in No. 8 she only earns 9.7 cents per hour. On the other hand, the basters in No. 8 include 3 men, since the work requires higher skill than can be obtained by the employment of girls, and their wages are 14 cents per hour, compared with 13.2 cents in No. 4.

With regard, therefore, both to the amount of wages and the amount of time, the German small shop is at a disadvantage compared with the Jewish and Polish shops under the factory system.

ESTABLISHMENT No. 9.

Establishment No. 9 is run on the factory system, producing "special-order" coats at \$1.35 per coat. This shop, compared with No. 8, clearly expresses the difference between the shop and factory. The time required on a \$1.35 coat is 7 hours,

whereas No. 8 requires 12 hours 48 minutes on a \$1.75 coat. The advantage in time is 40 per cent. The operator in No. 9 requires 2 hours; in No. 8, 4 hours. The wages of operator in No. 9 are 15 cents per hour, while the operator in No. 8 gets 9.7 cents per hour. This is probably due to two causes: One is that part of the operators in No. 9 are Jewish men, while the operators in No. 8 are German girls; the second cause lies in the difference of production—the factory system as against small production. While the operators in No. 9 earn more money, they work 40 per cent cheaper per coat than those in No. 8.

The same holds true in the case of the basters. The baster gets 17.4 cents per hour in No. 9 and 14 cents per hour in No. 8; but he bastes the coat in 2 hours in No. 9, while in No. 8 it requires 4 hours.

The ability of establishment No. 9 to produce cheaply arises partly from the mixed nationalities of the employees, including Poles, Jews, and Germans, with little resisting power in respect to "driving." The several nationalities working together find it harder to organize themselves or to come to an understanding than in shops where one nationality is employed. This brings about a wide diversity of wages. Some of the basters earn as high as \$18, \$15, and \$14, and the operators \$16, \$14, and \$12. The contractor is able in the high grades of work, where great skill is required, to pay good wages, and to pay low wages for the low grades of work, where he employs German and Polish girls.

ESTABLISHMENT No. 10.

Establishment No. 10 is a "special order" coat shop in Chicago, producing a \$2 coat, with 19 employees making 150 coats per week, working at the rate of 60 hours per week with foot-power machines.

The labor cost per coat is \$1.49 as against a labor cost of \$1.06 on the \$1.35 coat in the factory (No. 9), and as against a labor cost of \$1.47 in establishment No. 8, which is run by German girls, on a \$1.75 coat.

No. 10 has an advantage over the small shop of the Bohemians and Germans in producing a \$2 coat in 7 hours and 36 minutes, as against 12 hours and 48 minutes in the German shop on a \$1.75 coat, and 6 hours and 30 minutes in the Bohemian shop on a \$1 coat.

It will be seen that Establishment No. 10, making coats with Jewish men as operators and basters, is producing a coat cheaper than establishment No. 8 with German girls, or No. 7 with Bohemian girls, but that it costs more than it costs No. 9, with both Jews and Germans and men and women, running on a factory system.

ESTABLISHMENT NO. 11.

[Inside shop; New York, coat shop; steam power; superintendent, Jew; employees, Jews and Italians, 124 employees in one system; 600 coats per week. 59 hours per week.]

Establishment No. 11 is a large "inside" factory in New York employing 124 people, making 600 men's fine coats per week. If the coat were given out to a contractor it would probably cost \$1.50, but in the manufacturer's own shop it costs \$1.43. Ready-made fine coats of this class can be made much more successfully in the large inside shop, with a minute division of labor, than can cheaper grades of coats. The same manufacturer who operates this inside shop for his fine work sends out his cheaper coats to contractors.

It requires in this factory about 124 people to make a coat. The economies are mainly the following: The division of labor makes each person in the several occupations able to produce more work than would be possible if the labor was not so intensely divided. It also makes it possible to introduce a large number of unskilled workers, at low wages, for parts of the work where skill is not required.

The coat is made in 12 hours 11 minutes, as against 3 hours 41 minutes in Establishment No. 2, and 3 hours 55 minutes in No. 1 for a coat at half the price.

The operators in this factory are mostly Jewish men. They receive fairly good wages, as will be seen from the schedule, one man getting \$17 per week; two, \$16; one, \$13; three, \$12, and two, \$11, working 10 hours a day. There is only one getting \$8, and an Italian man and woman getting, respectively, \$5 and \$3.50.

The average wages for all operators per hour are 9.1 cents, which is about the same as in establishment No. 2 and establishment No. 1, where Jewish help is employed. Since the time of the operator is 1 hour and 3 minutes, as against 57 minutes in No. 2 and 43 minutes in No. 1, and, taking into consideration that the other two shops are making a 75-cent coat, it is seen that establishment No. 11 can operate a coat in a shorter time and pay about the same wages.

But the main economy in this class of shops is with the baster and edge baster. Here a large number of Italian men and women are introduced, working at low wages. Out of the 45 basters, edge basters, and seam pressers there is only one at \$13 a week. There are two at \$12; two at \$11; two at \$10; two at \$9; and thirty-six at \$8, \$7.50, and down as low as \$1.50. A large number of Italian girls, as will be seen, are working for \$1.50, \$2, \$2.50, and \$3 per week.

The average wages for the baster have fallen far below the wages received by the baster in establishments No. 1 and No. 2. While the baster in No. 1 gets on an average 16 cents an hour, and in No. 2, 13.6 cents per hour, yet in No. 11 the earnings are only 10.3 cents. The time for basting in No. 11 is 1 hour and 21 minutes, as against 1 hour and 26 minutes in No. 1 and 1 hour in No. 2; showing that the basting in No. 11, while it is produced by very cheap help, costs much more per dollar's worth of work than in either No. 1 or No. 2.

The presser in No. 11 gets better wages than in the other two shops, probably because skilled mechanics are required, and the off-pressing can not in the nature of things be very much divided, so that it takes a first class presser to do the work.

It is this class of shops, making first-class coats, with very cheap help, that is extending the ready-made clothing business among people who formerly were only custom-made clothing. It is displacing the custom tailor by producing a coat as well, or almost as well, as he does for less than one-fifth of the price required by him.

The example of this shop should be well considered by those who expect that the abolition of the contractor and the substitution of large inside shops will improve the condition of the employees. This particular shop is a model in its external and sanitary aspects; the hours are shorter than elsewhere, and the best-paid employees receive as high wages as elsewhere; but by its subdivision of labor a place is found for women instead of men, and for the very cheapest class of help.

ESTABLISHMENT No. 12.

Establishment No. 12 is a coat shop at Egg Harbor, N. J., employing girls as machine operators and a few girls as edge basters, making 500 coats per week, working 60 hours per week; contract price per coat, 45 to 52½ cents.

Establishment No. 12 can be favorably compared with establishment No. 8, a German shop in Chicago making a \$1.75 garment. It will be seen that the average wages per hour in establishment No. 8 are 11.5 cents, while in No. 12 they are 9.7 cents, showing that in small country towns labor can be procured at somewhat less per hour than in the large cities, employing the same nationality.

If establishment No. 12 is compared with establishment No. 4, which is a Polish shop in Chicago employing girls, it will be seen that the average wages in No. 4 are 12.2 cents, as against 9.7 cents in No. 12, emphasizing the point that female labor is usually cheaper in small towns than in large cities, probably due to the different standard of living and the lower cost of living.

The average wages for the operator in No. 4 are 13.2 cents; the average wages per hour for the operator in No. 12 are only 8.8 cents.

The cost of basting, per coat, is about the same in both cases, being 13.2 cents in No. 12 and 13.9 cents in No. 4.

IX. CONCLUSIONS AS TO CLOTHING TRADES.

The following conclusions relative to wages and prices, based on the foregoing discussion, are made in comparison of the period of 1878-1882, when the immigration of Russian Jews began, and the year 1900-1901.

The clothing trade has been affected more than any other trade by successive waves of immigrants, especially Irish, Germans, Scandinavians, Jews, Italians, Poles, Bohemians, and Lithuanians.

Wages have always been extremely unstable; in the dull season being much lower per day and per piece than in the busy season. This is not the case in other countries where tradition is stronger, nor in other trades where labor unions have better control. In ladies' cloaks and suits, work is less steady than in men's and children's clothing, and the prices are higher in the busy seasons and lower in the dull seasons.

The organization and evolution of the trade have passed through four stages: (1) the journeyman tailor; (2) the home shop; (3) the task shop or small contractor's shop; (4) the factory.

This increasing subdivision has reduced the cost of making a coat about as follows: Task system, 50 per cent below journeyman tailor's price in dull season; factory system, 40 per cent below task system; total, 70 per cent below journeyman tailor's dull-season price or 85 per cent below busy-season price—i. e., from \$5 to 75 cents.

The increasing subdivision of labor has substituted simple operations for complex operations and has increased the speed and exertion of the workman.

While wages by the hour, day, or week on factory products have decreased in most cases and remained constant in a few cases, yet the increased overexertion and overtime are more exhausting to the employee than they were 20 years ago.

Custom or journeyman tailors earn higher wages than formerly, not mainly through organization, but partly because of the high skill required, partly because of the new demand for ladies' fine tailoring, and partly because of the growth in wealth of the wealthier classes whom they serve.

The wages per week of male operators and basters on coats in task shops in New York have fallen one-sixth, their hours increased one-fifth, their weekly output has increased two-thirds, the piece price of their product has decreased one-half without any change in machinery or subdivision of labor.

These low wages, long hours, and overexertion in the task shops are partly the result of an antiquated system of production in competition with factory methods, and partly the result of an overcrowded labor market and lack of organization.

The wages of women hand sewers on coats, except finishers and edge basters, have remained constant.

The wages of women edge basters on coats have declined one-fifth, and they have been replaced by male immigrants at wages per week about 50 per cent higher than those which the women formerly received, but per piece the same, owing to the greater speed and endurance of men.

The earnings of women finishers on pants in New York declined one-third when the Germans began tenement-house work 10 years ago, and again declined one-third when the Italians drove out the Germans. In Boston the legislation restricting tenement-house work prevented the latter decline.¹

Pressers' wages per week have fallen 10 per cent, but per piece 40 per cent, and their hours have increased 20 per cent.

Cutters' wages have been constant, or have slightly advanced, and the hours have been reduced in the better shops, through the aid of the organization. In the small shops, where there is no organization, wages have been reduced. For these wages the cutter has heavier work and has increased his output 50 per cent by shears, 150 per cent by machine, and 200 per cent by knife.

The wages of pants operators in New York have not declined nor the hours increased, owing to the superior organization of the union.

Wages in coat shops on the factory system with minute division of labor, are higher per hour, the day's labor is shorter, the skill in each particular operation is greater, and the cost of the coat is less than in the task or small shop system. Moreover, men are not replaced by women.

The competition of the immigrant is not felt until the second or third year after his arrival, even in the simple operations, because he requires that much time to increase his skill and speed to the point where he can earn \$10 to \$15 per week. At these rates of wages his labor is cheaper than that of the "green" immigrant who can earn \$5 per week 3 months after landing.

The condition of the immigrants is better than it was in their native countries, but their standards of living are much lower than the standards of those longer in the country with whom they compete for employment.

¹ See following chapter on Tenement House Work, p. 369.

The sons of tailors do not generally enter the clothing trade on account of its uncertainty, low pay, long hours, and unwholesome conditions, but the women and girls who enter the shops are mainly American-born children of immigrants.

Men's labor in shops, owing to greater skill, speed, and endurance, is worth about 50 per cent more per hour than woman's work in shops, and women and girls working for \$5 to \$9 per week tend to displace men above \$8 to \$14 per week on corresponding work, but men working at these or lower wages have displaced women. The competition of women has forced men to increase their exertion without increasing their wages. Women are especially available in preventing men from raising their wages through strikes.

Labor organization has been especially difficult on account of immigration, mixed nationalities, female or child labor, country competition, tenement-house work, and the introduction of the division of labor. After male immigrants have been here 2 or 3 years they are willing to organize, but are prevented from bettering their condition by the new arrivals whose necessities compel them to accept low pay. The only enduring organization has been that of the cutters, who are but slightly affected directly by immigration. The most successful organization of factory tailors is that of the Swedish pants and vest makers of the "special order" trade in Chicago. This organization has raised wages at the time when other wages were falling. The "special order" trade furnishes a peculiar leverage for a labor organization, since it requires trained mechanics, and the work can not be postponed in case of a strike.

Different nationalities have introduced different modes of production: The Jews, the task system based on speed, endurance, and team work; the Germans and Bohemians, the female finisher and foot-machine operator; the Scandinavians, the large steampower shop, with minute subdivision of labor, for pants and vests. The factory system in coats has originated with Germans, Scandinavians, and Jews. Immigrants have created for themselves new lines of ready-made products and have displaced the custom tailor, the dressmaker, and the housewife. This is true of all kinds of clothing, whether for men, women, or children. As a result, all classes of people are better dressed, in the latest styles, and they spend much more money every year for clothing.

Tailors who have been displaced by green immigrants of the same or other nationalities have found better positions as contractors, manufacturers, or small tradesmen, or have created a new line of product of a better grade. This displacement has been accompanied by hardship and temporary unemployment similar to that accompanying the introduction of machinery in other callings.

Legislation further restricting immigration would assist tailors now in the trade to organize and secure shorter hours and higher pay.

X. TENEMENT-HOUSE WORK AND LEGISLATION REGARDING IT

1. CONDITION OF HOME WORKERS.

The so-called "sweat-shop" legislation of the several American States, in so far as it adds to factory legislation in general, is simply legislation directed against tenement-house work.

The broad fact first apparent in this legislation is that American States in restricting tenement-house work have been legislating upon the subject of immigration in its most urgent and threatening aspect. Practically all of the work in tenements covered by the laws about to be considered is carried on by foreign-born men and women, and, more than that, by the latest arrivals and the lowest conditioned of the foreign born. The legislation on this subject is more radical and even despotic than any that can be found on the same subject in other countries, and its extreme forms are found in the three States of New York, Massachusetts, and Pennsylvania, whose great ports of entry receive the first impact of immigration. Moreover, this legislation has been forced upon these States, as a matter of fact, by practically two of the races that have been recently crowding into the cities, namely, the Hebrew and the Italian. It is the Italian woman, working in her close tenement, whose cheap labor has almost driven out all other nationalities from that class of work which is still mainly done in the home, namely, the hand sewing on coats and trousers. Of the 20,000 licenses granted by the New York factory inspector for "home finishing" in New York City, it is estimated that 95 per cent are held by Italians. In Boston, where the law has been rigidly enforced against unsanitary conditions, about 50 per cent of the 1,300 licenses are held by Portuguese and 12 per cent by Italians.

"Home finishing," it should be observed, is perhaps four-fifths of the work now done in tenement houses. It is that remnant of the former home shop where the

entire garment was made at home. In New York, coats and trousers are "finished" at home; in other cities, only trousers. In addition to home finishing, the only other classes of work affected by tenement-house laws are those of journeyman tailor and the woman who works for "pin money."

The Italian home finisher is usually compelled to take work home, because her husband is not making enough money to support the family. These men work mostly as street laborers, hucksters, and peddlers of fruit, fish, and other merchandise on the streets. When working as street laborers they are employed so few months in the year, and as peddlers their income is so small that they must get aid from their wives at home. The price paid for labor to a home finisher is about one-half that formerly paid to a woman regularly employed in the shop. A pair of pants is lined, bottoms basted or felled, and the buttons sewed on for from 5 to 7 cents at home, while formerly, before the Italians came in, it was 10 and 14 cents in factories and 7 to 10 cents in the homes of German finishers, so that the Italian finisher works for about two-thirds of the price which other nationalities formerly received for the same work. This is not true, however, in Boston, where the strict enforcement of the laws restricting tenement-house work has lessened that form of competition, and where, on this account, the prices continue at 7 to 10 cents.

The Italian family not only makes its living by the aid of home work by the wife and children, but by this process it is made possible for the Italian laborer to bid on much cheaper terms for labor in other employments than it would be possible for him to do if his wife and children were not engaged in the business of sewing at home. Consequently, this practice not only has a damaging effect on the shop worker in the sewing trade, but it also affects the people engaged in the same callings as the Italian laborers. It is possible for the Italian to work on railroads and on streets and buildings for a lower price than he would be able to do if he did not receive this aid from his mother, his sister, his wife, and his children at home.

The following are cases taken at random from notes on the homes of the Italian finishers:

Anabella, 235 Mulberry street, rear tenement, second floor front; pants, 5 cents apiece; woman, her mother, 2 children, husband; she does not know what he does or what he makes. Two women can together earn \$3 a week. Old woman looks 80, is 52; been in the country only 5 months; husband worked with shovel in old country; she didn't sew in old country—took care of house; conditions here about same as those in old country; 2 rooms, rent \$8.50; 2 windows in outer room; 1 child of 5, 1 of 6 months; licensed place.

Donia Falzia, 235 Mulberry street, third floor, rear tenement; pants, 5 cents; finishing; good grade of work (pants probably sell at \$3.25 retail); says it takes an hour; husband works at shovel—\$1.25 to \$1.50; rent, \$7.50, 2 rooms; no children.

Came here from Boston to see his family; worked on pants in Boston, but in shops, not in houses; must pay there \$15 or \$16 for a shop, which must be nice, while here you can work in ordinary rooms; married 2 years (in Boston); been in this country 3 years; was working in shop before she was married; 7, 8, and 10 cents per pair when working in shop in Boston—\$4, \$5, and \$6 per week; earns now \$3 a week—sometimes.

Antonia Searfino, 235 Mulberry street, third floor; 5 cents per pair pants; bastes bottoms, puts lining on; 1 hour to make; 2 years at this business; 4 in this country; married, with 1 baby; sister works with her; can both together make \$4 a week; husband peddles fish and makes only \$1 to \$2 a week; in summer he can make \$4 to \$5; got married over here; husband been here 5 years; was married 2 years ago; did nothing before making pants; 2 rooms, \$8.50 rent; kitchen probably 10 by 12 feet; bedroom, 8 by 10 feet; she gets all the work she wants.

Lafel Agalo, 235 Mulberry street; 5 cents coat; felling front part of sleeves, felling armholes, bottom, and pulling bastings on 62½ and 75 cent coat; makes 2 or 3 a day; had this coat 3 days; 6 cents on coat when working in shop; husband a baker—\$4 to \$5 a week; didn't work when husband got more; can make 50 cents a day; does make only \$1 to \$1.50 a week, for works little; 2 children—little baby; learned in neighbor's house; learned only coat; 2 years in this country; 4 months only in shop; made then 55 or 50 cents a day; husband earned 20 cents a day in Italy; pays \$9 a month rent, 2 rooms; 2 windows in 1 room.

Legislation affecting the Italian home worker must of course be general, and must affect other nationalities and other classes of work manufactured under similar conditions. Among the other classes of work thus affected is that of the custom tailor or the journeyman tailor. This is the skilled mechanic who makes the entire coat. He makes one to three of these coats a week, and his home is not seriously encumbered with quantities of material, whereas ready-made clothing is handled in large quantities and is scattered everywhere through kitchen and bedroom, on floor, tables, and beds. Fifteen or twenty years ago most of the ready-made clothing was also made in the homes of the people. The ordinary shop was in the home, where most

of the members of the family were engaged, the man, his wife, and such grown-up children and other people as could be marshaled into service. The contractor's shop and what is called the "sweating system" have developed out of this. With the introduction of labor and sanitary legislation as applied to the sewing trade, the largest part of clothing manufacture has gone into shops of contractors, but there still remains a small number of families who are working on clothing in the old mode of production. Coats, pants, vests, and ladies' garments are made in the home, with the help of the wife and children and sometimes of others, and by means of this labor and with the opportunity of working unlimited hours they are able to hold their own in open competition with the shop. Home work is usually practiced by people who prefer isolation and do not like to go into a shop to work, and are not able to establish large shops of their own. It is because of a sort of conservatism with regard to new modes of production that these people still hold their own in these home shops.

The urgent complaint made by tailors of all classes against home work is based on the obstacles which it places in the way of organization and joint protection of their wages and hours of employment. The agitation conducted by the journeymen tailors' organizations of this country is directed more vigorously against their members doing work in their own homes than it is in regard to holding up the regular price for their labor. It is claimed that it is harder to organize the home workers than it is to organize those who work in back shops or in regular shops, because they are scattered through the city and the organization has no means of getting control over them or finding them if they are wanted. They have no opportunity of coming together in an organization with other people employed in the trade. Usually the contractor from whom they take work speaks their language, and in their homes they usually hear nothing but their own language, so that they have no opportunity of acquiring a language common to others in the same industry so as to make it possible for them to be interested in a common cause. Being slow to learn English, they are slow to become Americanized.

Subcontracting is the rule in this business. Manufacturers do not want to be bothered with giving out small lots of work such as would be required by a man who worked only with his family. Consequently, such a family is forced to take work not from the manufacturer direct, but from some contractor in the neighborhood. When the home worker complains, he is told by the contractor, "I am not making the price; the price has been made by the manufacturer for me," and as the manufacturer is never seen, they know nothing about him and so can not influence him. In this way home work reduces the resisting power among the tailors when the price for labor is reduced. As they have no opportunity of becoming acquainted with one another they can not give expression to a common grievance.

The difficulties of organization are especially noticeable in the case of the Italian home finishers. They receive such a small income from their earnings that they are not able to pay dues to carry on the expense of an organization. They work so continuously, and are so busy caring for their families at home, that they can not spare the time to go to meetings or participate in an organization. They seem to be like chattels of their husbands and the other male members of the family, and would be looked upon as a sort of rebels if they participated in any form of protest against their condition. The same is true in their dealings with the contractor. Any effort to resist the oppression of the contractor would be met by him with the threat that he would employ other help and have his work done inside or by other Italians.

An apparent exception to this rule is that of the finishers for certain shops which have been organized by other nationalities. The Swedish women in the "special order" trade of Chicago have required the contractor to pay 14 cents per pair of pants to the Italian finishers at home, and have organized about 600 of them for this purpose. The Swedes have been able to do this because they have a strong union, practically monopolizing their line of work, and because they wish to protect also the 300 Swedish and German home finishers on the same work. So exceptional, however, is this case of apparent organization of home workers that it is looked upon by the people in the trade with great curiosity.

Another class of workers who are beyond the field of organization are the women who work for pin money. These are usually married women or widows of American birth. They may formerly have been engaged in some occupation in the sewing trade, and in case of emergency they strive to help themselves upon the death of the breadwinner or during times when they are not fully supported by their husbands, or when they wish additional money while their husbands are being employed. Such a woman will usually take clothing home, doing the felling or making the button-holes by hand, and working for less money than the people employed regularly at the trade. Since she is not compelled to wholly support herself by her labor she can get the little that she needs even if she works for half the price that the woman must demand who is dependent upon similar work for subsistence. This line of employment is also practiced extensively in making shirtwaists, wrappers, underwear,

children's knee pants, and in some cases on ready-made and even custom-made vests; in almost every case decreasing the price for labor. A dozen women's wrappers will be taken out by the woman who needs some additional money for 45 to 75 cents, when the girl working in a shop, in order to make a living, will have to ask 75 cents to \$1.10 for the same thing. The girl in the shop must earn at least \$4.50 to \$6 a week in order to make a living, while the woman working for pin money will be content to earn \$2.50. This reduces the price for labor below the point of subsistence for the girl in the factory.

It is very difficult, almost impossible, to organize in a union the people who do not stay at the trade regularly and only work for the sake of earning pin money. Their intention is not to make a living at the business, and the pay is so low that they abandon it as soon as possible. It is impossible to get them into a labor organization. They cut the price for labor and there is no redress from the grievance. It is probably true that, out of regard for this class of women, American legislation has not taken the advanced step of prohibiting outright tenement-house work and instead of prohibitive laws has adopted the device of licensing such work. This will appear from the description of such legislation in the following pages, where it is shown that the factory inspector is given discretion in granting and revoking licenses. If the inspector is charged with laxity in enforcing the law, he appeals to the cases of individual hardship which it would bring upon women forced by emergency to work at home. The factory inspector of New York, who has not taken the advanced ground of inspectors in other States in enforcing the stringent law of that State, gives an illustration in his report for 1899 (p. 52) of the hardship of strict enforcement compared with the leniency of nonenforcement. He cites the following parallel incidents:

Where the law was not enforced.

The New York Evening World of January 18, 1900, reported the proceedings of the New York Diet Kitchen Association.

At this meeting Dr. Annie S. Daniels, a physician of New York City, reported on her visits to tenement houses where manufacturing is done. Her report is interesting and unquestionably true. During her narrative she spoke of one case which is particularly interesting and which we grant is an illustration of a condition where the law was not enforced. She is quoted as saying:

"You might not believe it, but I recently ran across a case where a woman could not spare the labor of a child only 3 years old. Some children at that time are actually useful in fixing trimmings on women's dresses."

It is said that the word picture of the little one at work caused the shedding of tears. And no wonder, for Dr. Daniels was speaking to a sympathetic audience.

A child of such tender years at work in a tenement sweatshop would appeal to the hardest heart and arouse the sympathy of the most callous soul.

Where the law was enforced.

Application No. 3687, asking for a license, was received at our suboffice in New York. The premises from which application came were carefully inspected and a license was refused the applicant, for sanitary reasons. The applicant was a woman, presumably a widow, who had three small children dependent upon her for support.

On January 16, 1900, our inspector who was detailed to inspect and investigate the condition of the premises for which license had been refused reported as follows on the case in point:

New York, January 10, 1900.

[Application No. 3687.]

This person was refused a license on November 22, 1899. The contractor refused to give her more work to do in her apartments in violation of the law. Therefore, she has been obliged to go to the shop to work, to support herself and little ones. I found on my visit to her room three small children, the oldest apparently not over 5 years of age, alone in a cold room, no fire whatever, and the place almost entirely bare of furniture.

I learned from the housekeeper of the premises that this mother goes to work at 7 o'clock in the morning; she returns at noon to give the children some dinner, then goes back to work, not returning until 6 o'clock in the evening. These little children are alone all day with absolutely no one to look after them or keep a fire to warm them.

JOHN H. STORY,
Deputy Inspector.

From a purely humanitarian standpoint, which narration presents the most pitiful picture! On the one hand we have the 3-year-old child helping its mother in the home—never out of her sight—always where the mother could attend to its wants and allay its fears and suffering. While, on the other hand, we see the mother compelled to desert her three little ones of very tender years, going out to the shop to work, because the law prohibits her bringing the work into her home. As a result thereof these unfortunate little ones are thus deprived of the scant care a hard-working mother could bestow upon them, they are left alone in a tenement, shut up in a fireless room with no one to attend to their wants. Is not this a sadder picture than that presented by Dr. Daniels? We do not attempt to mitigate the frightful conditions existing in places that our inspectors have not up to this time reached, but we do say that the strict and unrelenting enforcement of our present law will cause untold misery and suffering.

While individual cases of hardship can often be cited, it is claimed that the price paid for the labor of these women home workers is so low that a widow or other woman in need is not able to make a living wholly by that labor. It is often the case that widows who work at home at this kind of employment are being partially supported by charity. The charity thus received makes it possible for them to

work for less wages than they would receive if they had to work in a factory and wholly support themselves.

Since the standard of living of the working classes is generally recognized as equally important with their organization in maintaining a high rate of wages, the question of the influence of home work upon their standard is of vital interest. It is claimed by tailors that home work reduces the standard of living. They do not care for a fine home with good living rooms when the home is almost all of the time used as a shop, with pieces of cloth and rags lying about and with pressing irons and sewing machines crowding upon the space. In the Italian home with its twenty or more pairs of pants or as many coats and jackets scattered through the kitchen and living rooms, and the wife busy plying her needle, it necessarily results that the surroundings are uncared for and filthy and the children neglected and dirty. Furthermore, the husband or other support becomes less energetic in the effort to provide for those dependent upon him, and he feels at liberty to spend in drink or other luxuries the money which he would otherwise have been compelled to expend for his family.

It is claimed also that the man who works at home has irregular hours and usually works all the time he can spare, day and night; he employs his wife and children as helpers, and is usually able at a pinch to get cheap help by employing his neighbors' boys, girls, and wives. Thus in open competition he is able to underbid the man who works in the back shop or the regular factory. As a consequence the price for labor is not stable and there is a constant cutthroat competition between the people in the trade for the purpose of getting work, since the long hours worked per day make it impossible for work to last throughout the year.

The effect on the intelligence and personal initiative of the tailors is also depressing. The man who can rely upon the earnings of his wife and children loses the spirit of enterprise. Improvements in the mode of production are absolutely out of the question. Home shops are usually not able to use improved machinery, nor are they able to subdivide labor so that each laborer is utilized in the most efficient manner. Consequently by the old mode of production the laborers must work longer hours and utilize the labor of women and children in order to hold their own in competition with the better shops.

For these reasons it is quite generally argued by tailors that if the manufacture of clothing in tenement houses could be prohibited they would be benefited. They would earn a better living in factories, with regular hours of work, with a better protective organization, and without the depression of their homes and the oppression of their wives and children.

2. PROTECTION OF THE PURCHASER.

The most effective agitation and legislation against tenement-house work has been undertaken, not on behalf of the workers, but on behalf of the public which purchases clothing. The contagious and infectious diseases which are presumably carried by clothing from tenements to the consumers are phthisis, diphtheria, small-pox, chicken pox, scarlet fever, and measles. It is not known that any definite case has ever been reported where contagion was actually proven, owing to the large number of hands through which the goods pass before they reach the consumer. At the same time, the danger of contagion is apparent. The report of the New York tenement house commission for 1900 says (p. 70):

Tenement-house labor is generally carried on in the dwelling room of the family, where old and young are crowded in with the workers. The danger of contagion, when any member of the family is ill, therefore, is very great. A member of the commission has seen garments piled on the floor in the midst of dirt and rubbish, garments stacked on the bed, and some of them used as pillows for sick children; and in one instance garments were found stored in the same room with a sick man apparently in an advanced stage of tuberculosis. Such conditions the commission regards as a serious menace to public health. It believes that manufacturing can not be continued in the tenement houses with safety to the general public except at great expense in the way of investigation and supervision, in view of the immense amount of labor at present carried on in tenement houses.

"The risk run by the purchaser of a costly cloak," says the report of the Illinois factory inspector (1895, p. 55), "or a custom-made suit is precisely the risk run by the workman buying a cheap, ready-made suit and by the poor woman who gets from a bargain counter knee pants for her boy. In the cloak trade, the clothing trade, the merchant tailors' custom trade, although the manufacturer or merchant tailor may have shops in good sanitary condition, nothing of his manufacture can be guaranteed noninfectious so long as the greater part or any part of his work is done on tenement-house premises."

Complaints similar to the foregoing have resulted in legislation regulating tenement-house work in the States of Massachusetts (1894, 508, 44), New York (G. L. 32, 100), Pennsylvania (1897, 37; 1899, 64), New Jersey (1893, 216), Illinois (1893, p. 99), Missouri (1899, p. 273), Michigan (1896, p. 233), and Ohio (1899, p. 213). (See Report of Industrial Commission on Labor Legislation, Vol. V, p. 116.) Following is a description in detail of the main features of this legislation.

3. LEGISLATION GOVERNING TENEMENT-HOUSE WORK.

A. Persons permitted to work in tenement house or dwelling.—In no State does the legislature take the radical step of prohibiting outright tenement or home work. If such step has ever been taken it has been declared unconstitutional by the courts, as was done in New York with the statute of 1884, c. 272, prohibiting the manufacture of cigars in tenement houses on any floor partly occupied for residence purposes. (In re Jacobs, 98 N. Y., 98.) The unconstitutionality of this statute was maintained by the court on the ground that it did not clearly appear on the face of the law that its primary object was to secure the public health.

The existing statutes, following the clue suggested in New York decisions, go only so far as to restrict the number of persons who shall be employed in a room or tenement. In Massachusetts, Ohio, Indiana, New Jersey, and Illinois this restriction excludes everyone except "the immediate members of the family living therein."

In Missouri the number is restricted to "three persons not immediate members of the family living therein." In Pennsylvania, New York, and Michigan there is no definite restriction to the members of the family nor any specified number of outsiders, but the factory inspector uses his discretion at this point. In Pennsylvania, where the law does not prohibit the employment of outsiders in the family, the inspector reaches that result by specifying in the license only the names of immediate members of the family who are permitted to work in the room or apartment. While the statute does not, on its face, grant this authority to the inspector, his action has not been tested in the courts. At the same time the statute restricts the number to be employed so that "not less than 250 cubic feet of air space shall be allowed for each and every person."

In New York the minimum air space is also 250 cubic feet in the daytime and 400 cubic feet at night, and there is no specified limit on the family relationship of persons who may be employed in a room or tenement. The factory inspector in his discretion has adopted the rule that in the ready-made trade no outsider shall be permitted to work with the family, but in the custom trade the tailor may bring in one or two outsiders. This distinction is based on the difference between the low-paid Italians who do the work of finishing ready-made garments and the relatively high-grade mechanics who make the custom work. The latter have larger and better premises, but even in this case the character of the premises may be such as to forbid a permit to outsiders.

Certain statutes provide that nothing in the law shall be so construed as to prevent the employment of a tailor (Massachusetts and New York) or seamstress (Massachusetts, New York, Pennsylvania, and Michigan), by any person or family for manufacturing articles for such person's or family use.

B. The tenement described.—The places to which the law governing tenement manufacture applies are usually described as a "room or rooms, apartment or apartments in any tenement or dwelling house" (New York, Massachusetts, New Jersey, Pennsylvania, Indiana, Missouri, and Michigan) to which Illinois adds "used for eating or sleeping purposes." It is especially provided in Massachusetts that "a room or apartment in any tenement or dwelling house which is not used for living or sleeping purposes and which is not connected with any room or apartment used for living or sleeping purposes, and which has a separate and distinct entrance from the outside, shall not be subject to the provisions of this act." In Ohio it applies to every "dwelling or building, or any room or apartment of itself, in or connected with any tenement or dwelling or other building." And New York, New Jersey, and Indiana add also any "building in the rear of any tenement or dwelling house."

C. Articles included in legislation on "tenement" or "home" manufacture.—Legislation upon this subject applies in the first instance to wearing apparel and secondarily to cigars and cigarettes. The laws are not uniform, certain States (Massachusetts and Ohio) covering all wearing apparel whatsoever, and others (New York, Pennsylvania, New Jersey, Illinois, Missouri, Indiana, and Michigan) covering only specified articles.

In Massachusetts (1894, amended 1898) the law covers "the making, altering, repairing, or finishing any coats, vests, trousers, or wearing apparel of any description whatsoever."

The Ohio law (1896) includes "any process of making any kind of wearing apparel for male or female wear, use, or ornament, or for the manufacture of cigars, cigarettes, or tobacco goods in any form, when such wearing apparel or other goods are to be exposed for sale or to be sold by manufacturer, wholesaler, or jobber, to the trade or by retail."

The New York law (1899) includes the "manufacturing, altering, repairing, or finishing coats, vests, knee pants, trousers, overalls, cloaks, hats, caps, suspenders, jerseys, blouses, dresses, waists, waistbands, underwear, neckwear, furs, fur trimmings, fur garments, skirts, shirts, purses, feathers, artificial flowers, cigarettes, cigars, or umbrellas."

By a special clause the New York act excludes "collars, cuffs, shirts, or shirt waists made of cotton or linen fabrics that are subject to the laundrying process before being offered for sale." This exclusion of so-called "white goods" does not occur in the laws of other States. It is apparently an effort to carry out consistently the theory that the law is designed to protect the purchaser, leaving the worker free to do as he pleases where the public health is not jeopardized.

The Pennsylvania law is identical with that of New York except that it uses simply the word "manufacture" and does not include hats and caps, and no exception is made of "white goods." It includes the "manufacture of coats, vests, trousers, knee pants, overalls, skirts, dresses, cloaks, hats, caps, suspenders, jerseys, blouses, waists, waistbands, underwear, neckwear, furs, fur trimmings, fur garments, shirts, hosiery, purses, feathers, artificial flowers, cigarettes, or cigars."

The Illinois law (1893) includes "the manufacture, in whole or in part, of coats, vests, trousers, knee pants, overalls, cloaks, shirts, ladies' waists, purses, feathers, artificial flowers, or cigars."

The New Jersey law (1893) includes "the manufacture of coats, vests, trousers, knee pants, overalls, cloaks, furs, fur trimmings, fur garments, shirts, purses, feathers, artificial flowers, or cigars."

The Missouri law (1899) includes "the manufacture of any wearing apparel, purses, feathers, artificial flowers, or other goods for male or female wear."

The Indiana law (1899) includes the "manufacture of coats, vests, trousers, knee pants, overalls, cloaks, furs, fur trimmings, fur garments, skirts, purses, feathers, artificial flowers, or cigars."

D. Register of tenements and sweat shops.—An essential feature in the supervision of sweat-shops and home workers by the factory inspector is the register or list of such places. In the enforcement of the ordinary factory law it is sufficient for the inspector himself to compile such a list from the visits of his deputies or from a city directory. But in the case of small contractors and home workers the number is so large and fluctuating, and individual workers are so completely hidden in the homes, that a house-to-house canvass by the inspectors can not be relied upon. Consequently the statutes of several States place the responsibility of locating these outside workers and shops upon the manufacturer or contractor who furnishes them work. Of course every manufacturer keeps a list of all his outside contractors and finishers for his own use, and it is a simple matter to require him to produce such list for inspection by the factory inspector (New York, Pennsylvania, Missouri, Illinois, and Michigan) or to furnish a copy of the same on demand (New York, Pennsylvania, Missouri, and Michigan). In Massachusetts, where the statute does not require the manufacturer to furnish the list, the inspector secures it through voluntary arrangement. The manufacturer furnishes a list of his contractors (and home finishers) and the contractors in turn furnish lists of their home workers. When a manufacturer with an "inside shop" gives out work to his own employees to be taken home at night these also must be included in his list.

The compilation and checking of these lists in the office of the inspector requires considerable clerical help, especially in the city of New York, where the list runs as high as 20,000 names. Usually the names are arranged in card catalogue, by streets, and the constant changing of residence, the overlapping of names on the lists of different manufacturers, and the problematical spelling, require a highly perfected and adjustable system of registration.

E. Publicity of register.—The most effective check upon the manufacturer is publicity. So apprehensive is he at this point that a contractor who has once been fined in court is thenceforth unable to get work from him. Therefore, if the manufacturers' lists of contractors are treated as public records, open to the inspection of private citizens, then such agencies as trade unions, consumers' leagues, and charitable societies are able directly to reach the manufacturer, and through publicity to enforce his responsibility. It is undoubtedly a defect in the administration of the law hitherto in New York that these lists are not open to the public, like other records.

F. License.—In the enforcement of the ordinary factory and workshop laws the factory inspector is required to come into court and prove his allegations in order to enforce a penalty for the violation of the law. The alleged violator enjoys the benefit of the doubt, and the inspector and prosecuting attorney are held to the strict interpretation of the statute. The delay, uncertainty, and formality of such proceedings render the law often nugatory and always problematical. If, however, the inspector were permitted, upon his own belief, not merely to prosecute the violator, but also himself to impose the penalty without recourse to the courts, the execution of the law would be summary and decisive. This is the intended effect of the "license" or "permit" clause in the recent legislation of Massachusetts, New York, Pennsylvania, New Jersey, Indiana, and Michigan. This license is not merely a means of maintaining a register of the places where clothing is made, but it is a substantial condition, dependent largely upon the discretion and good judgment of the factory inspector, without which the worker or contractor is prohibited from getting

employment. The refusal or revocation of a license by the inspector is a more severe penalty than the imposition of a fine by the court. The latter takes away a portion of the man's earnings, but the former shuts him off entirely from his ordinary means of getting earnings. The license is the most powerful weapon in the hands of the factory inspector. It practically removes the workers in question from the ordinary protection of the courts and places them under the direct control of an administrative officer. To the courts there remains not the enforcement of the substantial features of the law, but only the enforcement of the administrative feature, which prohibits a contractor or home worker from working without a license. The inspector revokes the license on his own discretion, and only calls in the courts to punish the one who works without a license. Of course there remains always the judicial remedy by mandamus or injunction, but in the case of the poverty-stricken workers of the tenement houses this is not a substantial remedy.

Massachusetts was the first State to introduce the license feature as a part of its factory legislation. The law of 1891, amended in 1898, prohibited tenement-house work unless a member of the family "shall first procure a license, approved by the chief of the district police," in whose hands is the enforcement of the general factory laws. It was the successful operation of this statute which led five other States to copy the provision. In Massachusetts, New York, Pennsylvania, New Jersey, Indiana, and Michigan the tenement worker is required to make application to the factory inspector for a license, and "no person, firm, or corporation shall hire, employ, or contract with any member of a family not holding a license therefor," to manufacture the designated article in a tenement or dwelling. In Pennsylvania the license is required also for "any building or parts of building," and in New York and Indiana for any "building in the rear of any tenement or dwelling house." The latter provision was designed principally as a means of registration, in order to bring the rear factories under the observation of the factory inspector for the purpose of the ordinary factory legislation; but since the license can be revoked for these rear clothing factories in New York and Indiana, and for all clothing factories in Pennsylvania, these establishments, as well as the tenements, are brought under the direct control of the inspector. The advantage of this control was referred to by one of the Massachusetts inspectors, who says (Rep. 1900, p. 231):

The regular workshops inspected were found, with few exceptions, in fairly good order, their great fault being the dirty state of their water-closets. If the owners of these establishments were compelled to obtain a permit from this department similar to the home-workers' license, strict cleanliness and healthier conditions could be easily obtained.

Before the license is granted the factory inspector is required to make an inspection of the room, apartment, or building sought to be licensed, and to ascertain (1) whether it is in a clean and proper sanitary condition; (2) whether there is the legal limit of air space for each person employed (New York, Pennsylvania); (3) whether it is adequately lighted by electricity or other suitable light (New York).

After the license is granted the place must be kept in the proper condition designated by the inspector, and is subject to his inspection at all times for the purpose of "ascertaining whether the garments or articles manufactured are clean and free from vermin and other matter of an infectious or contagious nature." (N. Y., sec. 100; Mass., sec. 44.)

If, upon inspection, the conditions are found not satisfactory, the license may be revoked.

The discretionary power of the inspector in granting and revoking licenses is evident from the terms employed in the several statutes. In New York he shall grant the license if he ascertain that the premises are in "a clean and proper sanitary condition," and it may be revoked if he find that "the health of the community or of the employees require it, or if it appears that the rooms or apartments to which such license relates are not in a healthy and proper sanitary condition." (N. Y., sec. 100.)

In Massachusetts the inspector determines only that the premises are "kept in a cleanly condition." (Sec. 44.) In Pennsylvania and New Jersey the "permit may be revoked at any time the health of the community or those so employed may require it." (Pa., 1897, sec. 1; N. J., 1893, sec. 1.)

The foregoing terms indicate that the criterion of cleanliness and sanitary condition must necessarily be left to the judgment of the inspector. And since inspectors differ materially in their judgment, the efficacy of the law depends largely upon the individual opinion and strength of character of these administrative officers. Indeed, under the terms of the statutes it is conceivable that tenement-house work could be almost wholly abolished, provided inspectors were selected whose standards were high enough. Such would seem to be almost the necessary result where, as in Massachusetts and New York, the instructions printed on the back of the license state that one condition "which must be observed in order to obtain and retain a license" are "absolute cleanliness of apartment and immediate premises, halls, stairs, yards, and closets." Were absolute cleanliness enforced, very few licenses could remain long outstanding.

The Illinois legislation does not require a license for home work, but by ordinance the board of health of Chicago issues such a license. This, however, contributes to the administration of the law by the factory inspector only in cases of infectious and contagious disease.

It should be added that in all States where manufacturers with "inside shops" give out work to their own employees to be taken home for work at night and on Sundays, these also are required to have a license.

G. "Tenement-made" tag.—The legislation of Massachusetts (1891) and New York (1899) has gone further than that of other States in strengthening the licensing prerogative of the inspector. In Massachusetts whoever sells or offers for sale wearing apparel made in unlicensed tenements is required to affix to each garment so made a conspicuous tag or label with the words: "Tenement made" legibly printed, and the name of the State and town or city where the garment was made. In New York the law is more effective, since the inspector himself affixes the label whenever he finds goods manufactured without a license. No person except the factory inspector is permitted to remove or deface the label, the penalty being the same as for other violations of the labor law. This label, of course, as long as it remains affixed, renders the goods unsalable. In practice, the procedure in New York is somewhat as follows: In case a license has been refused upon application of a home worker the deputy inspector returns to the place of residence of the applicant within the period of two weeks to see whether the worker has followed the instructions given in the letter of refusal. If the designated improvements have been made he reports favorably and a license is sent to the applicant. But if he finds that no improvement has been made the case is closed, and no further inspection is made on the basis of the application. If the applicant desires a license he must renew his application.

If, upon inspection of premises for which a license has been refused, the inspector finds work is being conducted, he is required to affix the label "Tenement made." The inspector then secures the name of the contractor or manufacturer for whom goods are being made and instructs the workmen to notify the contractor to go to the factory inspector's office and make application for the release of the tag. The inspector also sends notice to the office that goods in the hands of the designated worker and belonging to the said contractor have been tagged.

The contractor goes to the office of the factory inspector usually with the worker, and in applying for the release of the tag, signs a form stating that the goods were being manufactured for him in unlicensed rooms. This signature becomes evidence in court on the complaint of the inspector.

If this is the first offense of the contractor he is simply warned, and is told to take the goods to his office and the deputy will be sent there to remove the tag. If it is a second offense prosecution is decided upon, and the matter is turned over to the district attorney, the deputy of the factory inspector being the complainant and witness.

The efficiency of the "tenement-made" tag is sometimes questioned, on the ground that it can easily be removed by the worker without discovery and punishment. But a consideration of the circumstances will conclusively answer this question.

The tag is placed upon the goods by the deputy inspector, who immediately notifies the central office. The unlicensed worker must then go to the office in order to make application to have the tag removed. If he does not go, then it is the duty of the inspector to make another visit to his premises in order to discover the reasons for his nonappearance. If the inspector follows up the case, plainly the only conditions under which the worker could afford to remove the tag would be either by resolving to discontinue work or by moving to other quarters. And, since it is the practice of the department to prosecute not the worker, but the contractor, there is good reason why the worker shall respect the tag and bring his contractor before the inspector. He has a chance of finding another contractor if he secures a license, but he has no such chance as long as he stays in the same tenement without a license.

It will be readily understood from what precedes that the "tenement tag" is a powerful weapon in the hands of the factory inspector for prohibiting work in unlicensed places, and thereby enforcing the inspector's control over this class of manufacture. At the same time, it involves a considerable amount of formality and some uncertainty. In Pennsylvania, on the other hand, where the tag is not in vogue, this formality and uncertainty are avoided by the radical device of authorizing the inspector or his deputies to condemn and destroy all goods found in "unhealthy or unsanitary" places. Such destruction in other States is confined to "contagious and infectious" diseases, and is permitted only to the local boards of health.

The "tag" and the manufacturer.—While the manufacturer is not legally responsible and penally liable for violations of the law by home workers, he can be reached indirectly through restrictions on the sale of his goods (Massachusetts, New York, Ohio, and Missouri), or by the confiscation and destruction of his goods (Pennsylvania).

In Massachusetts (sec. 47) and Missouri (sec. 10) the merchant or dealer whose goods have been made in unlicensed or contagious places is required to label such goods with the "Tenement-made" tag, and in New York (sec. 102), where the inspector affixes the tag, and in Ohio the goods are prohibited from being sold or offered for sale.

The tag, as long as it remains affixed, is an effective prohibition on the sale of goods, and it would seem that on this account the Ohio law, which does not provide a tag, is defective. But the inspectors in Massachusetts and New York do not interpret their law as intended to reach the manufacturer in this way. They consider the purpose of the tag accomplished when the home worker or the contractor is punished if it be an unlicensed place, or when the goods have been disinfected if it be a case of contagion. Consequently, when this result is accomplished they remove the tag and permit the goods to go to the manufacturer and the market. In this way the tag fails to affect the sales of the manufacturer and imposes no restraint upon him.

H. New Zealand legislation.—In this connection the "factory act" of New Zealand, adopted in 1894, is interesting as a piece of legislation which has almost abolished home manufacture from the market. According to that statute, every building or place where two or more persons are employed, directly or indirectly, in manufacturing any article for trade or sale is defined as a factory or workshop, and is thereby brought under the stringent provisions governing factories. Like other factories, it is unlawful for work to be carried on without a license, and in granting or revoking a license the inspector enforces the laws regarding sanitation, prohibiting meals from being taken in the workroom, prohibiting the employment of children (except in special cases), prohibiting the employment of boys under 16 and women and girls for more than 48 hours per week, prohibiting overtime, and providing for holidays and Saturday half holidays. Manufacturers are permitted to give out work without restriction to these licensed places, but every "occupier of a factory, every merchant, wholesale dealer, shopkeeper, agent, or distributor," who gives out work to an unlicensed place—i. e., to a single home worker—is required to affix to such article a manufacturer's label, as follows:

Made by..... In No..... street, IN A PRIVATE DWELLING OR UNLICENSED WORKSHOP. AFFIXED UNDER FACTORY ACT. Any person unlawfully removing or defacing this label will be prosecuted.
--

This label, by rendering goods unsalable, has stopped the manufacture of goods in unlicensed places, but the significance of the New Zealand law lies in the fact that all of the licensed places are raised to the same level as the regular factories, not merely in sanitation, as in the United States, but also in the hours of labor and the nonemployment of children.

I. Contagious and infectious diseases.—Since the main object of the existing statutes touching tenement manufacture is the protection of the purchasing public, the sections relating to contagious and infectious diseases have the leading place. In dealing with this phase of the clothing manufacture the factory inspector requires the cooperation of the local boards of health. There are two ways in which contagious or infectious diseases are discovered where clothing is being manufactured: First, by the board of health; second, by the factory inspector.

Local physicians are, of course, required by law to notify the board of health promptly of all such cases under their care. Boards of health in the several States, cooperating through courtesy, though not so required by law, with the factory inspector, send in daily reports to that official containing a complete list of all contagious diseases. Where the inspector maintains a street list of home workers, as is done in Boston, New York, Philadelphia, and Chicago, it is an easy matter to refer at once to such list and to locate the presence of the contagious disease in the tenement where clothing is being manufactured. It is the duty of the inspector to go at once to the infected premises and to revoke the license, if necessary. This, of course, stops the lawful manufacture of clothing in those premises for the time being. In New York the inspector affixes the "Tenement-made" tag to such goods as he finds and turns them over to the board of health, who may disinfect the goods and remove the label, or condemn and destroy them.

In other States the board of health is given power to take such action as the public health may require. In Pennsylvania, as already stated, the factory inspector and his deputies have the unusual power to destroy goods both in places of contagion and infection, and also in other places which are merely "unhealthy or unsanitary."

Boards of health also notify the inspector each day of all places which have been disinfected, upon which the deputy returns the license to such as have been deprived of it during the continuance of the contagion.

The question as to whether it is possible to thoroughly disinfect woolen and cotton goods in cases where they have been contaminated by such diseases as phthisis, diphtheria, smallpox, chicken pox, scarlet fever, and measles, is answered differently by different medical authorities. The Pennsylvania law is based upon the theory that such disinfection is at least uncertain, if not impossible. Undoubtedly, were it known to the purchasing public that a certain lot of goods had been exposed to contagion, they would decline to purchase such goods, even though officially assured that they had been "thoroughly disinfected." From the point of view of the consumer, whatever difference of opinion may exist among medical experts, the Pennsylvania law authorizing the destruction of contaminated goods by the board of health or factory inspector is the safest and most satisfactory.

J. Prosecution and penalties.—The penalties prescribed for violation of any of the requirements in the law range from \$3 for the first offense in Illinois to \$20 in New York, and \$50 in Pennsylvania and Massachusetts. The maximum penalties for later offenses are \$100 in Illinois, \$200 in New York, and \$250 in Pennsylvania. In New York and Pennsylvania there may be added imprisonment for not more than 30 days.

The question as to whether these penalties apply equally to home workers, contractors, and manufacturers is an important and interesting one. Plainly the enforcement of the penalties for violation upon the home workers imposes a burden out of proportion with the same penalty enforced upon a contractor, and far more than the same penalty if imposed upon the manufacturer. Also the difficulties of prosecution in the case of the thousands of home workers are far greater than in the case of the hundreds of contractors or the tens of manufacturers. Furthermore, the moral effect upon others is small when a home worker is prosecuted, compared with the effect of a prosecution of the contractor, and insignificant compared with the prosecution of a manufacturer. The home worker is unknown and without influence, and moreover is dependent upon the contractor. On the other hand, if the contractor is held responsible for violation of law on the part of his home workers, he can control every one of them, whether they be ten or five hundred. The simple refusal to give them work is the heaviest of penalties. Consequently, the several statutes forbid contractors from giving out work to families not holding licenses (Massachusetts, New York, Pennsylvania, New Jersey, Indiana), or when notified by the inspector that such family has not complied with the law (Ohio). In New York the inspector has prosecuted not more than a half dozen home workers and has secured only one or two convictions, but he has prosecuted nearly 150 contractors and secured nearly 100 convictions.

While the penalty imposed upon the contractor is more effective than that imposed upon the home worker, it is the manufacturer who holds the strategic position in the enforcement of the law. If he employs 50 contractors and each contractor 50 home workers, plainly he gives employment to 2,500 home workers. The contractors are dependent upon him just as the home workers are dependent upon the contractor. The manufacturer's position before the community is a responsible one. The sale of his goods depends upon the reputation of his house.

The existing laws do not make the manufacturer penally responsible for violation of law by home workers when employed by his contractor. Of course, if he employs them directly, or if he sends out work at night by his own employees, he is responsible for this home work. But generally, and this is the essence of the sweating system, he gives his work to contractors, and these in turn give it out to the home finishers. Consequently, if the manufacturer were brought into court under the existing statutes for work being done in unlicensed homes, he could claim that it was not he, but his contractor, who gave out the work to the home finisher, and who is responsible for the same. The contract system possesses as one of its advantages, not merely the cheaper cost of manufacture, but also the shifting of legal responsibility from the manufacturer to the middleman.

K. The landlord.—Tenement house workers are usually a floating population with very little property, and their places of residence are rapidly changing. In addition to this, when they are congregated in large numbers, of foreign extraction and illiterate, the mere uncertainty as to the spelling of their names makes the problem of the factory inspector a perplexing one. To reach them all individually and continuously is impossible. They must be reached either through their employer or through their landlord. While the legislation of several States brings in the employer, i. e., the contractor or sweater, New York is the only State which makes the

landlord responsible. In addition to the ordinary requirements governing the sanitation and safety of dwelling houses, the New York law (sec. 105) prohibits the "owner, lessee, or agent of a tenement or dwelling house, or of a building in the rear of a tenement or dwelling house" from permitting the use of his premises for the manufacture of clothing without a license and contrary to law. The factory inspector is required to serve notice of such violation upon the owner, lessee, or agent, and the latter is given 30 days in which to cause the unlawful manufacture to discontinue, or 15 days thereafter in which to bring proceedings for dispossession, the unlawful manufacture being constituted a sufficient cause for dispossession. Failure in this subjects him to penalties as though he himself were engaged in the unlawful manufacture.

To what extent the provisions holding the landlord responsible can be made of practical value has not yet been determined, since the New York inspector has not relied upon it in the enforcement of the law.

L. Summary.—It may be briefly stated in regard to the effectiveness of the foregoing laws on tenement-house work that—

1. They have cooperated with the economic development of the industry in driving shopwork from tenements. Practically in Massachusetts, New York, and Pennsylvania there are at the present time very few, if any, of the home shops which occasioned complaint 10 years ago. The only remaining home work of significance is that of home finishers, custom tailors, women who work for pin money, and employers who take work home at night from the shop. Home finishing is that subsidiary part of hand work on coats and pants which has not yet been transferred to the regular workshop. It is now the bulk of home work. In Boston, where the law has been strictly enforced, there is very little home finishing, this work being largely transferred to shops, and the wages are 40 to 50 per cent higher than in New York for the same work.

2. With a strict enforcement of the law the system of licensing is superior to the proposed abolition of home work, since the inspector is then able to grant the privilege of home work in cases of emergency where peculiar hardship would otherwise result, while at the same time he reduces the amount of home work to the point where its competition does not seriously affect the condition and wages of labor. This strict enforcement of the law, however, since it depends upon the discretion of the inspector, is very difficult to secure.

3. The statutes, in placing discretionary power in the matter of granting and revoking licenses in the hands of the factory inspectors, intrusts them with the most powerful of weapons, namely, the right to grant or withhold the privilege of earning a living. The great powers of this office, resting, as they do, in the hands of subordinates, render the right selection of appointees extremely important, since its opportunities for corruption and political favoritism are unusually tempting. The success of the law in Massachusetts is doubtless owing more to the civil-service regulation and permanent tenure of the inspectors than to the stringent character of the law.

4. The evident success of the leading States in reducing the evils of tenement-house work through legislation, and the apparent willingness of other States where a less amount of clothing is made to copy their legislation, make Federal legislation unnecessary and inadvisable. The existing defects are not in the laws, but in the administration of the laws.

5. The depressing effects of immigration on wages are materially counteracted by the restriction or prohibition of tenement-house work, and this, together with the jeopardy to the purchasing public through contagious and infectious diseases, render the strict enforcement of the laws restricting tenement-house work of vital importance, both to clothing workers and to the public.

4. PROPOSED ABOLITION OF TENEMENT-HOUSE MANUFACTURE.

The excessive evils of tenement-house manufacture, and the difficulties of regulation, have caused a demand in various quarters for its abolition by legislation. This demand is based on the alleged impossibility of adequate inspection, and the resulting danger to the purchaser of clothing. Says the Illinois inspector (1895, p. 52):

It is clear that even the 1,715 contractors' shops now known to us can not be inspected often enough to render it safe for the public to purchase goods made up in them while they are kept on premises where poverty continually breeds disease, and though any one given shop may be wholesome enough, yet no goods can be guaranteed noninfectious which have passed through it to the rooms of the poverty-stricken home finisher. * * * From this danger nothing short of prohibition can protect the purchaser. * * * The dangers of the shop are much increased by the circumstance that garment making is a season trade, that the season is uncertain, and it is short and very intense. New people open shops who were never contractors before, and knew nothing of the requirements of the law. During the season no staff of inspectors could cover all the shops often enough to prevent violations of the law or give assurance that no infectious disease is in the shops where garments are being made. * * * The city ordinance requires the physician who is attendant upon any case of infectious or contagious disease to report the same to the board of health, but physicians can not report what they do not know, and in many cases among the very poor a physician is called in only when death is imminent to save the annoyance of a coroner's inquest. Meanwhile infected clothing may have been finished and sent out for weeks before the danger is known by anyone.

The following is from the report of the Illinois factory inspector for 1896 (p. 43):

The eagerness of parents to conceal the presence of disease has led them to hide, in all conceivable ways, children sick with infectious maladies, locking the patient in the pantry, covering it with a pile of garments in process of manufacture, and to tear down quarantine cards or to post them on rear doors. Practices of this kind, which caused public protest in the smallpox epidemic of 1884, went on without any outcry during the long struggle with diphtheria in 1896. They baffle at all times, and with varying degrees of success, the efforts of all officials, State and local, who try to protect the public health by enforcing the regulations of tenement-house shops.

No goods can be guaranteed noninfectious which have passed through the tenement-house shop and a home finisher's living room, and so long as the wholesale manufacturer has any goods made up on tenement-house premises none of the goods can be guaranteed free from danger of infection, since neither the retailer nor the purchasers can know which among them are tenement made.

Charges like the foregoing found expression in a demand for Federal legislation governing the subject, the best known of which was the so-called "Sulzer bill," introduced in the Fifty-fourth Congress. (Fifty-fourth Congress, first session, H. R. 3346.) This bill, while in form it provided simply for a license system, would in effect have amounted to prohibition, since the amount of the license was placed high above profitable expenditure. The bill provided that every person engaged in the manufacture of clothing and cigars who shall give out material for manufacture "in rooms or buildings occupied for eating, sleeping, or domestic purposes," shall pay a "tax of \$300 annually for each person with whom a contract or agreement to wholly or partially manufacture or make up such articles shall be made." The tax was to be collected by the officers of the United States internal revenue.

One objection to this act, supposing it not to be prohibitive, would be the apparent guaranty which a Federal license would give against State interference. It is probable that Federal legislation on this subject would come under the head of a regulation of interstate commerce, and as such, a Federal law might provide for identification of tenement-made goods by means of a label, such as is described above under the legislation of Massachusetts and New York.

The New York tenement-house commission in presenting its preliminary report in 1901, made recommendations going far toward the abolition of tenement-house work (p. 70-71):

The law requiring the licensing of work carried on in tenement houses has undoubtedly led to certain improvements, but the very attempt to enforce the law has furnished additional proof of the undesirability of the conditions. Where workers apply for a license they may be investigated, but if a license is refused it is not always possible to be sure that work will be discontinued, and if the license is not applied for it will only be by chance that the tenement-house workshop will be discovered.

The commission does not feel warranted in recommending the absolute abolition of tenement-house labor. It recommends the amendment of chapter 191 of the laws of 1899 by the insertion of a proviso that no license shall be issued for any room in a tenement house containing less than 1,250 cubic feet of air, or used for the purpose of cooking, eating, or sleeping, or for children, or otherwise than as a workshop. This recommendation regarding the size of the room in which labor should be allowed is based upon the knowledge of the constant use by all the members of the family of any room connected with a living apartment. It is also based upon the universally accepted fact that the average tenement-house family consists of five members, though undoubtedly in frequent instances the borders taken by such families make the average size higher. Among the Italian garment workers it has been frequently found that two, and even three families, making a total of from 10 to 15 individuals, occupy a single apartment. But taking the conservative estimate and applying the provision of the law that a workshop must have at least 250 cubic feet of space for each worker, your commission believes that 1,250 feet (12 by 12 by 9) should be required as the minimum size of any workroom in a tenement house, because experience has shown that an average of not less than five persons will use the room for a greater or less part of the day.

While the tenement-house commission only recommends a minimum cubic capacity for living rooms in which clothing manufacture is conducted, yet to one who is familiar with the dimensions of the rooms in which at the present time the Italian home finishers are at work, it will be evident that the minimum, 1,250 cubic feet, is so high that but few families could qualify for the license.

The Illinois inspector in his report for 1899 takes a less radical position regarding the abolition of tenement-house work than in earlier reports. He says in advocating for Illinois the enactment of a law similar to that in Massachusetts, New York, and Pennsylvania (p. 15):

This law has had a thorough trial in New York, Pennsylvania, and Massachusetts, and there is no doubt of its successful operation. Not only will it to a certain extent protect the public and employees from the danger of tenement-house manufacture, but it will check the growth of the sweatshop system and aid in the development lately noticeable toward the more wholesome conditions of the factory. In 1894 this department reported that the garment factory was disappearing before the tenement-house shop. In the last two years the number of establishments in the garment trades employing more than 50 people has increased from 70 to 89. This, with other data at hand, leads to the conclusion that the tendency is now in the other direction.

The proposed law in eliminating the most unsanitary shop will also eliminate the most tenacious rivals of the factories. As the economies practised by such places at the expense of the employees and the public are no longer tolerated, they will not be able to compete with the steam-power and progressive management of the modern factory. In this future extension of the factory lies the best hope of doing away with the abuses that are inherent in the sweating system, and will never entirely disappear as long as the system itself survives.

5. PUBLIC CONTRACTS.

While neither the Federal Government nor any State government has undertaken to abolish tenement-house work where the work is sold to private purchasers, yet where the Federal Government itself is a purchaser of clothing it has recently instituted measures for the protection of its public servants. The departments of Federal Government for which clothing and uniforms are manufactured are those of the Army and Navy. The latter carriers purchase their own uniforms according to the Government specifications. In certain cases, as at Philadelphia, the association of letter carriers inserts a clause in the contracts prohibiting tenement-house work. Practically all of the clothing for the Navy is manufactured at the Naval Clothing Factory, navy-yard, Brooklyn.

Army uniforms were formerly purchased from contractors without specifications as to conditions of manufacture, but beginning in 1900, owing to revelations made regarding the contagion of measles and similar diseases in the Army camps during the Spanish-American war, the quartermaster at Philadelphia, under whom the heavy clothing is manufactured, has inserted in his "Information to bidders for the manufacture of military garments," the specification that "all work, including operating, finishing, buttonholing, pressing, etc., must be done in a regularly organized factory, conforming in every detail to the factory laws of the State of Pennsylvania; no sweatshop work will be allowed under any circumstances."

The following article is inserted in the contracts:

ARTICLE III. It is expressly agreed that no part of the work incident to the manufacture of said clothing shall be sublet or made in any place not covered by the factory laws of the State of Pennsylvania and evidenced by the certificate of an authorized factory inspector, and that failure to comply with the conditions of this clause shall be deemed a valid cause for canceling this contract, and withdrawing all work that may be in course of manufacture.

That in case of failure of the said party of the second part to comply with the stipulation of this contract according to the true intent and meaning thereof, then the party of the first part shall have the power to have the work done by others of his own selection and charge any additional expense incurred against the party of the second part.

It is stated by the assistant quartermaster-general at Philadelphia that the insertion of these clauses in the contract "has had no noticeable effect on the contract price of making."

The khaki clothing for soldiers in the Tropics is manufactured under the supervision of the quartermaster's department at New York. These contracts include a clause to the effect that all such clothing "must be made by the contractors in their own factories under the most perfect sanitary conditions."

Clothing for the National Guard of the several States is usually purchased from the War Department, and is therefore protected by the specifications of that Department. When the clothing is purchased from other sources there are usually no specifications regarding labor or conditions of manufacture, except in Massachusetts and California. A Massachusetts law provides that clothing shall be made in the city of Boston and not in a sweatshop, and an inspecting officer is detailed at all times to enter factories each day to see where they are made and the manner of making.

For the National Guard of California the only clause affecting labor or its location is a clause prohibiting the employment of either "convict or Chinese labor in or about the manufacture of the material used or in the performance of the labor in carrying out the contract."

All the clothing for the National Guard of Pennsylvania is made in the manufacturing department of the State arsenal.

In New York all contracts for the manufacture of clothing for the militia include a clause which prescribes that all the laws and regulations of the State of New York relative to the employment of labor, the hours or work, places wherein work shall be carried on, shall be strictly observed. A clause of this kind, of course, does not require contractors to go any further than the law requires private manufacturers to go in eliminating subcontracting and tenement-house work.

Canada.—The movement in the government of Canada to suppress "sweating" in carrying out government contracts had its beginning in the post-office department and has extended to the contract work of all branches of the administration.

The first antisweating regulations in Canada were made in connection with contracts for the supply of mail bags and satchels for the post-office department. The militia department was the next to introduce regulations into its contracts. These regulations have been inserted in all contracts awarded since 1898 for the manufacture of militia clothing. The contracts of the several departments have similar "regulations framed with a view to securing the payment to the workmen of fair wages and the performance of the work under proper sanitary conditions."

The following section is inserted in the contracts:

With a view to suppressing the sweating system and securing payment to the workmen of fair wages and the performance of the work under sanitary conditions, this contract shall be subject to

the following regulations, and strict compliance with the true spirit and intent of the various provisions herein contained is required:

SECTION 1. All articles included in this contract shall be made up in the contractor's own factory, and no portion of the work of making up such articles shall be done at the houses of the work people. The contract shall not, nor shall any portion thereof, be transferred without the written permission of the minister of militia and defense; and subletting of the contract or any of the work to be performed under the contract, other than that which may be customary in the trades concerned, is hereby prohibited.

SEC. 2. If the contractor violates the condition herein mentioned against subletting he shall not be entitled to receive any payment under the contract for work done by the subcontractor; and the minister of militia and defense may refuse to accept any work performed by a subcontractor in violation of the prohibition herein contained against subletting.

Great Britain.—On February 13, 1891, the following resolution was passed by the House of Commons:

Resolved, That in the opinion of this House it is the duty of the Government in all Government contracts to make provision against the evils recently disclosed before the sweating committee; to insert such conditions as may prevent the abuse arising from subletting; and to make every effort to secure the payment of such wages as are generally accepted as current in each trade for competent workmen.

February, 1892, returns of the forms issued by the war office, admiralty, board of works, and other departments of the Government were called for.

The following extracts from the conditions of contracts made by the board of trade (Parliamentary Papers, 1892, LXIV, 189) are representative of the conditions made by the several departments:

SEC. 5. The contractor undertakes that all garments included in this contract shall be made up in his own factory, and that no work shall be done at the homes of the work people. Any infringement of this condition, if proved to the satisfaction of the president of the board of trade, shall render the contractor liable to a penalty not exceeding £100 for each offense.

SEC. 6. No portion of this contract shall be transferred without the written permission of the president of the board of trade. Subletting, other than that which may be customary in the trades concerned, is prohibited.

In 1896 a special committee was appointed "to consider the working of the fair-wages resolution of the 13th February, 1891, and the administration of the various Government departments."

In considering the question of "subcontracting," the committee came to two propositions:

(a) Subletting or subcontracting may be perfectly legitimate where the particular form of contract in question is customary to the trade or where the contractor in question, in the ordinary course of his business, sublets or subcontracts that particular portion of the work.

(b) But subcontracting or subletting does not appear to the committee to be permissible where it is not customary to the trade, nor should the contractor who, in the ordinary course of his business, could not or would not himself carry out certain work be allowed to sublet it to others. Where a subcontract is allowed, the principal contractor should, as regards the carrying out of the fair-wages resolution, be held responsible for his agent. (Parliamentary Papers, 1897, X, 334, VI.)

The London county council.—"The council's standing orders provide that in all clothing contracts a minimum scale of wages for workers and work of every description shall be fixed by the council, and that contractors shall be called upon to sign an agreement to pay according to the scale. These standing orders were passed by the council as the result of an exhaustive inquiry into the conditions of the clothing trade with the object of securing the payment of a fair rate of wages. * * * Special clauses were inserted in the contract providing that the contract or any part, share, or interest in it should not be transferred, assigned, or sublet by the contractor, directly or indirectly, without the written consent of the council; that the contractors would directly employ and pay all work people employed in connection with the contract wages or remuneration at a rate or scale not less than the rate or scale fixed by the council, and would observe and cause to be observed by such work people hours of labor not greater than the hours of labor also stated in such schedule; further, that the contractors would carry out the work in their own factories.

"The contract also required the contractors to observe the following stipulations at all times during its continuance:

"(a) The rate of wages for every class of work done in any workroom shall be posted up in some conspicuous place in that room.

"(b) Any person authorized by the council shall have at all reasonable times free access to every part of the factory.

"(c) Any person authorized as above may see any worker apart.

"(d) The wages book shall at all times be open to inspection by any person thereto authorized by the council.

"In the case of the clause prohibiting 'home work,' one of the most fruitful sources of sweating which the council had strenuously set its face against, a penalty of £100 had been fixed."

In other clauses dealing with wages and the regulation of the factory a penalty of £25 was fixed for each breach. (London county council, annual report for year ending March 31, 1898; report of the stores committee, pp. 135-136.)

6. LABELS.

The wish of the purchaser to know the conditions under which his garments are manufactured is the basis of the organization known as the Consumers' League, organized May 1, 1899. (See testimony by Mr. J. G. Brooks, Manufacturers and General Business, Vol. XIV, p. 137.) The officers of this association enter into contracts with manufacturers binding them to obey the State factory laws in all their provisions, to have all their goods made wholly on their premises, to employ no children under 16 years of age, and to use no overtime work. Manufacturers signing this agreement are furnished with the official label of the league, to be attached to the garments which they place upon the market.

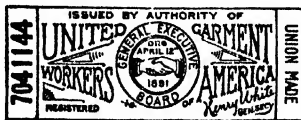

It will be seen that the conditions imposed by the Consumers' League are superior to those of the factory acts in raising the age limit to 16 when it is usually 14 and in prohibiting overtime work. The label has now been granted to 25 manufacturers controlling 26 factories situated in 9 States. Their organized customers are in 30 leagues in the 11 States of Massachusetts, New York, Pennsylvania, Ohio, Kentucky, Virginia, Illinois, Michigan, Wisconsin, and Minnesota, and in the Federation of Women's Clubs in those States and also in the States of Maryland, Tennessee, and Rhode Island. The Consumers' League has also enlisted the cooperation of the Women's Christian Temperance Union, the National Council of Jewish Women, the King's Daughters, and other organizations of women, whose members are recommended to give the preference, in their shopping, to garments bearing the label of the league.

It is noticeable that of the 25 manufacturers who are granted the label, 16 are in the State of Massachusetts and 9 in the rest of the country. This is due to the excellent factory legislation of Massachusetts and the thorough manner in which it is enforced. The standard in that State is so high that the manufacturers need make but few changes in their previous arrangements in order to receive the award of the use of the label.

It is stated by the secretary of the league (May 3, 1900) that no manufacturer in New Jersey or the city of New York appears upon the list, because the methods of enforcement of the factory laws therein have been such that the league has not been able to base upon them any guaranty that all the provisions of the factory law are obeyed in any given factory, or that all its goods are made on its own premises. It is hoped, however, that within the next two years efficient methods may be adopted by the departments of factory inspectors in both these States, and after this is done a large addition of manufacturers in New York City and New Jersey can be added to the list of label-using employers.

Slightly different from the label of the Consumers' League is that of the Garment Makers' Union. This label is granted only to those manufacturers who employ union help or send their work out to contractors with union shops. Heretofore, owing to the weakness of the union, many of these shops have not been superior either in wages, hours, or sanitary conditions to the majority of shops without the label. It was considered by the union officers that if by means of the label a large number of shops could be unionized, they could afterwards secure the better conditions. The label, therefore, has not stood for the absence of sweat-shop conditions, but has stood only for a willingness to lead in the improvements of conditions. This policy has been found unsatisfactory and unfair to the better manufacturers who adopted the label, and it therefore has recently been abandoned. By a resolution adopted May, 1901, by the executive board of the United Garment Workers of America, based upon instructions from their national convention, the label is hereafter to be furnished only to those manufacturers who maintain exclusively their own shops. The union label, like the Consumers' label, henceforth is intended to be a guaranty that the labeled goods are not manufactured by a contractor nor finished in a tenement.

CHAPTER IV.

EFFECT OF FOREIGN BORN ON CIGAR-MAKING TRADE.

The direct effect of immigration on the earnings of cigar-makers is slight. In 1900 the number of alien tobacco workers of all kinds who entered the ports was 377. The census of 1890 showed 111,625 tobacco and cigar factory operatives in the country, and it is estimated that in 1900 there were 88,000 cigar makers. (See Industrial Commission, Capital and Labor, vol. —, p. 720.) It is to the indirect effect of immigration that attention must be directed, i. e., the effect of the competition of those who learn the trade after arriving in this country.

Of the 94,176 white cigar and tobacco operatives in the United States in 1890, 35,096, or 37.3 per cent, were foreign born. The following table shows the distribution by nativity, parentage, and sex:

Tobacco and cigar factory operatives.

[Census 1890, Population, Part II, Table 82.]

	Number.	Per cent.
Total white.....	94,176	100.00
Native white, native parents:		
Male.....	22,468	23.85
Female.....	7,582	8.05
Native white, foreign parents:		
Male.....	20,378	21.52
Female.....	8,752	9.29
Foreign born:		
Male.....	27,972	29.72
Female.....	7,124	7.57

It will be seen that the foreign born of both sexes number 37.29 per cent of the total number of white operatives, and that the foreign born and the children of foreigners number 68.10 per cent of the total number of operatives.

Since the census does not separate cigar makers from other tobacco workers, it is impossible to present data from that source for that branch of the industry. In lieu thereof the following estimates are made of nationalities in the leading centers of cigar manufacture. It may be stated that in New York City probably 25 per cent of the cigars manufactured in the United States are supposed to be produced.

Nationality of cigar makers in leading centers.

	Total.	Germans.	Bohemians.	Jews.	Americans.	Others.
New York.....	15,000	5,000	4,500	3,000	2,500
Chicago.....	5,000	2,000	3,000
Philadelphia.....	4,000	900	1,200	1,900
Boston.....	1,600	160	600	680	160

The most serious effect on wages as a result of immigration followed the incoming of the Bohemians in 1879-80. The Bohemians have now established themselves in the trade in New York, and have made efforts to improve their wages. Following the Bohemians the next important wave of immigration was that of the Russian Jews, who have entered the trade during the past 10 or 12 years. It is the immigration of the latter race which at the present time occasions complaint.

Beside immigration, other factors which depress the wages of cigar makers are machinery and division of labor, country competition, and women and girls. Opposed to these are the efforts of labor organization.

The part played by division of labor in the trade may be inferred from the following description: "Booking" consists in straightening out and dampening the leaves. "Skrapping" is drawing out the large midrib of the leaf. "Bunch breaking" is the selecting and shaping of the "filler" tobacco. This is usually done by hand on the 10-cent cigars and by a mold on the 5-cent cigars. The hand work

without the mold produces the better cigars, since the arranging and shaping of the filler is then adjusted through the delicate touch of the skilled workman. "Rolling" consists in cutting the wrapper and then rolling it around the filler. This is done by hand or by the aid of a "suction table," the latter being a metal plate with perforations for air suction, so as to hold the leaf in place. The plate also cuts the leaf to the exact shape desired for the wrapper. Either with or without the suction table the cigar must be rolled by hand, but the table permits less skilled workmen and girls to take the places of the skilled mechanic. The Cigar Makers' International Union prohibits the use of the suction table by its members, and about one-half of its members are employed on hand work and one-half on mold work. "Team work," i. e., the division of labor where one employee "breaks bunches" for two "rollers," is also contrary to the rules of the union, but this rule is not enforced except in localities, like Boston, where the union is strong.

In order more accurately to compare the part played by immigration, country competition, and labor organization, the following table is compiled, showing the different prices at which a selected standard 5-cent cigar is made at the present time.

Prices for making "clear seed" mold cigars, "shape," $4\frac{1}{2}$ inches, per 1,000.

Locality.	Union scale.	Nonunion large shops.	Jewish sweat-shops.	Nonunion with suction table.	Country competition without suction table.
New York.....	\$3.50	\$6.00	\$1.00	\$5.00
Chicago.....	9.50	\$5.00 to 5.50	4.00
Milwaukee.....	7.50	5.50 to 6.50
Philadelphia.....	7.50	7.00	4.50
Boston.....	8.00
Berks, Bucks, and Montgomery counties, Pa.....	\$5.00 to \$5.50
Kingston, N. Y.....	4.00 to 5.00

The above prices include both bunch breaking and rolling. Where team work prevails—for example, on a \$4.50 cigar—the roller is paid \$2.50 per 1,000, and the bunch breaker is usually paid by the week on an estimate of \$2 per 1,000.

The significant fact to be noted from the foregoing table is the wide range of prices paid for identical work. Even the scales prescribed by the cigarmakers' union range from \$7.50 per 1,000 in Philadelphia to \$9.50 in Chicago. Outside the union the prices range from \$4 to \$7. The nonunion shops which pay \$5 to \$7 for hand work, or \$4.50 to \$5 with suction table, are usually large establishments, employing in Philadelphia as high as 900 and in New York as high as 2,000 work people. In these shops the employees are largely immigrants, but mainly women and girls, the American-born daughters of immigrants. The "suction table," it will be noticed, effects a very large saving for the manufacturer in the price per thousand cigars, as follows: In New York, \$1 below the nonunion shops and \$3.50 below the union scale; in Philadelphia, \$2.50 below nonunion shops and \$3.50 below the union scale, but only 50 cents to \$1 below the adjoining country product in Berks, Bucks, and Montgomery counties. The suction table is not used in Boston on account of the exceptional strength of the union, which includes more than 99 per cent of the cigar makers; nor in Chicago, where immigrant and sweatshop labor is abundant at low prices; nor in the country shops where labor is cheap. It is not extensively used in New York on account of the strength of the union and because the large manufacturers do not make their 5-cent cigars in New York. The latter are made in their country shops.

The sweatshop labor in New York and Chicago, which produces the cheapest work on this grade of cigars outside country districts, is Jewish. In Chicago this labor is employed not by contractors, but by small manufacturers, in cellars, alleys, and over stables under the most disagreeable surroundings of filth and overcrowding. These small manufacturers obtain their capital partly from the \$5 to \$15 which they charge the beginner for learning the trade. They also get his labor for three months free. They buy their tobacco and boxes and sell their cigars to jobbers. In New York these shops are strictly sweaters' shops, managed by contractors who take out tobacco belonging to manufacturers and return the finished product at a contract price for the labor. These shops, however, are very few in number, including less than 500 people, although prior to 1885 they predominated. The tenement-house legislation and the strong agitation of the labor organization have practically abolished this form of work. But in Chicago the small manufacturer or sweater controls a large proportion of the trade, including, perhaps, 1,000 employees.

The position of the labor organization in the manufacture of cigars is unique. The International Cigar Makers' Union, with 35,000 members—about 40 per cent of

the workmen in the trade—is noted for its high dues, its strong defense funds, and the determined strikes which it has conducted. Through its efforts there has been a continuous increase in the wages paid to its members, so that it is estimated that on a class of work where sweatshop and nonunion labor can earn \$6 to \$9 per week the union labor earns \$12 to \$18. In only one city in the country—Denver, Colo.—was there a decline in union prices during the depression of 1893-1897.

But the strength of the union has had a peculiar effect. While its membership has increased and its scale has risen it has lost control of the large factories, and the manufacturers have moved their establishments into country districts. This holds true only of the cigars which sell at 5 cents or less retail. On the 10-cent and higher-priced cigars the union labor retains its hold, but on this high-grade work the non-union workmen get the same prices as the union workmen.

The proportion of large factories controlled by the union may be judged from the following facts concerning shops in Boston, Chicago, Philadelphia, and New York:

In Boston, where the union controls nearly every shop in the city, the 10 largest shops employing more than 20 workmen each have 973 employees, being an average of 97.3 employees per shop, whereas 154 shops, each employing less than 20 men, have 500 employees, being an average of 3.3 employees each. The union rules provide that an employer may have the use of the label if he has been a member of the union 1 year or if he employs at least one workman. Consequently, since the employer counts as 1 workman, it is perhaps true that the 154 small shops in Boston with 3.3 employees each include less than 3 wage-earners each, and that a large proportion of the shops are simply a small manufacturer with an apprentice or a member of his family at work.

In Chicago the union controls 800 small shops, with 1,700 work people, or an average of 2.1 workmen each, including 200 small employers. In that city the large shops employing 20 or more people are, as a rule, nonunion shops. In Philadelphia the largest union shop has 14 employees. In New York the factories of 400 to 2,000 employees are nonunion.

The inference derived from these facts is that the high union scale is partly fictitious, because it represents in many cases merely constructive wages paid by the small cigar manufacturer to himself or to a member of his family, and not actual money wages paid to a wage-earner. The feature of the union by which this situation is maintained is the cigar makers' label. The label secures for those to whom it is granted an exclusive market of a certain class of customers, and is a substitute for the billboard advertising of the large manufacturers. There is a strong competition among label users for the market created by this kind of advertising, and the prices at which the 5-cent cigars are sold to retailers is \$2 to \$5 per 1,000 less than the price which the large manufacturers receive for their highly advertised cigars.

The significance of the position of the Cigar Makers' Union in this connection is that immigrants do not join the union, but are confined to nonunion shops, and even after learning the trade they continue to work on nonunion scales of wages.

More serious than immigration for the city cigar maker is the spread of country factories. In internal-revenue district No. 1, which includes, besides the city of Philadelphia, the counties of Berks, Bucks, and Montgomery, more than one-half the cigars are now made in the country shops. A Philadelphia manufacturer, without changing the number of his district, can plant his annexes in the country, where, in place of \$7.50 for union labor and \$7 for nonunion labor, he can have the same cigar made for \$5 to \$5.50. At this price the suction table is not profitable. These country establishments have usually several advantages. Small communities offer favorable inducements for the location of a large factory in their midst. They often donate the ground in fee to the manufacturer; frequently they provide a subscription toward the building, and they grant an exemption from taxes for a term of years. Lastly, the cost of living is lower in these country places, and the working population has not been instructed in the methods and aims of unions. Much of the work, however, is crude, and the 10-cent cigars can not be made on a large scale.

But the cheaper grades are increasing. In the counties of York and Lancaster, Pa., where large quantities of tobacco are raised, there have grown up many good-sized shops, and the tobacco growers themselves with their families occupy winter

months and rainy days in making cigars. Prices there are as low as \$1.50 per 1,000; but this is on cheaper cigars, without "shape," which sell 2 for 5 cents or 3 for 5 cents.

Large cigar manufacturers in the city of New York who have had labor troubles have within recent years turned especially to the towns of Pennsylvania, where they can find cheap labor, and in several cases have established what may be termed schools for the education of local labor in cigar making. Such establishments are located at Lancaster, York, Ephrata, Manheim, Danville, and Hamburg, Pa.; also in New York at Kingston and Newburg, and in New Jersey at New Brunswick and Elizabeth. These country factories employ from 25 to 1,000 people.

It is important to note, in connection with complaints made on account of the congestion of immigrants in the large seaport cities, that the country employment in the cigar trade is actually drawing immigrants from the cities. Philadelphia manufacturers and contractors to a considerable extent send employees from their city establishments to their country establishments, and frequently green immigrants, instead of stopping in the city, go directly to these country places in order to take up the manufacture of cigars.

Besides the country establishments the most serious encroachment upon the earnings of the skilled cigar maker is in the competition of women and girls. Through the increased division of labor and the introduction of the suction table girls can learn the trade so that a good hand at \$2.50 per 1,000 for rolling can earn \$7.50 per week. In this occupation, unlike clothing, endurance is not required, and therefore the work of women is a more serious competitor than it is in the manufacture of clothing. The large establishments in New York and Philadelphia which have in recent years extended the sale of advertised cigars employ almost exclusively girls and women, usually American born of immigrant parentage. In New York the recent strike in the largest factories resulted in the displacement of large numbers of men by girls. It is the opinion of the majority of cigar makers representing the local unions in New York that this competition of American-born women and girls is much more dangerous to them than immigration.

In the light of the foregoing facts regarding country competition and woman labor, immigration may be decided as third in importance in the depression of wages of cigar makers. It is doubtless true that the green immigrant, who is of course unable to become an apprentice in a union shop, turns to a "seab" shop of his own nationality. Here he can learn the rudiments of the trade, and can in time become a skilled workman. When he reaches that stage he is ready to join the union if work can be found in that direction. This the Jew has done in large numbers in Philadelphia, New York, and Boston. But in Chicago, with its extremely high union scale and a relative oversupply of union labor, he continues in the small shop of the Jewish manufacturer or enters a large nonunion factory, where at a rate of \$5 per 1,000 he can earn \$7 to \$12 per week. This class of competition has reduced the price on the 5-cent and cheaper cigars within 30 years to the extent of \$1 or \$2 per 1,000, but on the higher-grade cigars prices remain steady. In the cheapest shop in Chicago, on a 5-cent cigar employing immigrant Jews, the "roller" is paid \$2.50 per 1,000, and earns 80 cents to \$1.75 per day; the "bunch breaker" is paid \$1.50 per 1,000, and earns \$1.36 to \$1.44 per day. Following is a schedule of this shop, showing for each employee the price per piece, the amount of work done, and the daily and weekly earnings. The highest earnings are \$10.50 per week. On the basis of the usual 9 months' work this is an average of \$9.86 per week.

Following is a detailed statement of the cost of manufacture of a cigar which is made by a Jewish manufacturer in Chicago, employing 22 men and women of different nationalities, in a shop known as a "hobo" shop, over a stable, whose dimensions are 20 by 15 by 9 feet. This manufacturer sells his cigars to jobbers at \$14 per 1,000, the lowest union price for the same being \$23 and the price to the retailer being \$33.

Jewish sweatshop, Chicago—Bill of expense per 1,000 cigars.

Internal-revenue stamps.....	\$3.80
Filler (10 cents per pound).....	1.50
Binder (10 cents per pound).....	.50
Wrapper (30 cents per pound).....	1.50
Stripping.....	.50
Bunching.....	1.50
Rolling.....	2.50

Total.....	13.10

In a few shops in Chicago the Jewish cigar makers have formed a small organization independent of the international body, and have raised the scale of their pay from the prevailing \$5 or \$6 per 1,000 to \$7 per 1,000. The prospects of this organization, however, are not promising.

CHAPTER V.

THE FOREIGN BORN IN THE COAL MINES.

I. DISTRIBUTION OF FOREIGN BORN AND OF NATIONALITIES.

The coal mining industry of the United States has from the earliest times been a field peculiarly affected by the influx of fresh immigrants. Not only have men entered that occupation who had already become skilled miners in their European homes, but in recent years many unskilled laborers from European farms find in the American coal mines their introduction to American industry. In the year 1900 there were admitted to the ports of the United States out of a total immigration of 448,572 persons, only 2,822 miners. On the other hand, of the 163,508 "laborers" who entered the ports, after deducting the 42,101 who remained in New York, there were 47,317 who gave their destination as Pennsylvania; and of the 31,949 "farm laborers," 6,563 were destined to New York and 6,773 to Pennsylvania. It is, of course, not known what proportion of these laborers and farm laborers went into the mines of Pennsylvania, but that large numbers found work about the mines is certain.

The following table shows the destination of immigrants in 1900 who described themselves as "laborers," "farm laborers," and "miners:"

TABLE 1.—*Destination of laborers and farm laborers in 1900.*

Total.....	163,508	31,949	2,822

The following tables show for the years 1875 to 1900 the total immigration of miners and the leading countries and races from which they originate. The falling off in the numbers of English, Scotch, and Irish miners will be noted. English immigration reached its highest number, 2,598, in 1888, and has fallen in 1900 to 645. Scottish miners declined from 1,365 in 1888 to 58 in 1900; Irish from 510 in 1883 to 96 in 1898. On the other hand, Italian miners have increased from 14 in 1877 to 1,260 in 1900, and the Austro-Hungarian contributions from 23 in 1878 to 518 in 1887 and 293 in 1900. The latter figures for Italy and Austro-Hungary by no means fully indicate the existing predominance of these countries, since, as already stated, it is the laborers and farm laborers who contribute mainly to the mining population.

TABLE 2.—*Immigrants giving their occupation as miners, by nationalities, 1875-1898.*

The attraction of coal mining to the immigrant is also apparent from the census statistics. In Pennsylvania in 1880 there were 69,415 miners, of whom 35,015, or 50 per cent, were American born. In 1890 the number of miners had increased to 116,756, an increase of 47,341; but the foreign-born miners had increased from 34,400 to 67,790 and constituted 58.1 per cent of the total. In Ohio in 1880 only 41 per cent of the 5,575 miners were native born. In Illinois in 1880 the foreign-born miners were 58 per cent of the total number, and in 1890 they were 57.4 per cent of the total. The increase of 9,197 miners during the 10 years contained an increase of 5,087 foreign born.

The change in the character of the immigration into the mining regions, especially the region of Pennsylvania and Illinois, which occurred between 1880 and 1890, is shown by Table 6. It appears that while the number of Irish stood at about 11,000 for the 2 years, and the Germans increased 2,409, or 61.3 per cent, and the miners from Great Britain increased 9,994, or 63.3 per cent, yet the miners from "Other countries" (mainly Slavs and Italians) increased from 2,037 to 21,878, or 974 per cent. In Illinois, during these 10 years, the Irish remained stationary; the Germans increase 159.7 per cent; the British increased 9.2 per cent, but the "Other countries" increased from 604 to 3,218, or 432.7 per cent.

¹Tenth Census, Population Table XXXIV; Eleventh Census, Population, Part II, Table 116.

The Bureau of Mines of Pennsylvania in 1897 (p. xiv) attempted to find the number of native-born workmen employed in the mines of the State. Inquiries were made of several mine superintendents as to the number of men employed, the number of native born, the number of naturalized citizens, and the number of aliens. The following table gives the results:

TABLE 7.—*Foreign-born and native miners in Pennsylvania.*

		60.9		60.5

Mr. G. O. Virtue, in his report to the United States Department of Labor (Bulletin, Vol. II, pp. 749-750) on the anthracite mine laborers, says:

As has been said before, the early miners in the anthracite region were, for the most part, English, Welsh, Scotch, Irish, and German, and the growth of the mining population down to the early seventies was mainly through additions from the same stock, either by natural increase or by immigration. It was these people who, putting aside race and religious antipathies, acted together in the movement for the 10 years following the war in the Workmen's Benevolent Association. But about the time of the collapse of that society in 1875 immigration from another source began. It is at this time we first hear of the Poles, Hungarians, and Italians coming into the mining region. How far their introduction was due to the action of the operators under a system of contracting for their labor before their importation is not clear. It is quite certain, however, that this method of securing laborers was common at the time and had been for many years.

There is no doubt that the anthracite operators made use of this method of securing workmen. But at this time, and for 10 years afterwards, laborers brought in were from the United Kingdom or the northern continental countries, and, while from their presence in large numbers they may have contributed to the defeat of the strikers in 1875, they did not constitute a new feature in the mining population. During the late seventies began that immigration to the United States from southern and eastern Europe which has done more than anything else to change public opinion on the subject of immigration, and which led, only 20 years after the act to encourage the importation of laborers, to a complete reversal of the policy of that act. Indeed, it is difficult to see how a government which was using its power of taxation for the avowed purpose of maintaining a high standard of wages should so long have allowed employers to use so direct a means of defeating the efforts of laborers in their own behalf. But before the passage of the alien contract-labor law of 1885, a strong current of Poles, Huns, Italians, and Russians had already set toward the United States, a large part of them finding their way to the coal mines; and however well the law may have been administered, the current has continued to the present time even stronger than ever before.

The presence of this class of laborers no doubt contributed to the defeat of the strike of 1887-88. It is said that the operators had been making preparations for the conflict they saw approaching by inducing these men, either before or after reaching the country, to come to the mines. However that may be, there were, it is estimated, at the time of the strike, about 5,000 Poles, Huns, and Italians in the Lehigh district, and double that number in the Wyoming district. The United States census of 1890 shows the total number of these nationalities in the 5 anthracite counties to be 28,316. This is 10,307 less than the foreign-born Irish in the same counties, 5,627 less than the foreign-born Germans and Austrians combined, while of English there were 22,729 and of Welsh 23,404. There is no means of knowing the number of the various nationalities employed at the mines, but it is certain that a far greater proportion of the Polish, Hungarian, and Italian population are so employed than of the other nationalities named. A fairly accurate indication of the number and growth of this class for the last half dozen years may be had from the following figures, furnished by the Philadelphia and Reading Coal and Iron Company, showing the nationality and parentage, but not the place of birth, of the employees at their mines in 1890, 1895, and 1896:

TABLE 8.—*Nativity of miners employed by Philadelphia and Reading Coal and Iron Company.*

¹ Labor Troubles in the Anthracite Region of Pennsylvania, 1887-88. House Report, Fiftieth Congress, second session, No. 4147, p. 49.

The following table shows, for the State of Illinois, the birthplace of the 36,991 coal miners in that State in 1899. It appears that American-born miners are 43 per cent of the entire number, and that the foreign-born miners in the order of precedence are German, English, Italian, Polish, Irish, Scotch, Austrian, Bohemian, Hungarian, etc. In the first district, being the northern district of the State, the American born are only 10.6 per cent of the total number, and the Italian outnumber all other nationalities. These are followed by English, Hungarians, Poles, Scotch, Irish, Germans, and Bohemians in the order named.

¹ Illinois Coal Report, 1899, pp. lxii-lxiv

Speaking of the changes in nationalities of the miners in Illinois, a writer in *Mineral Industry* (1895, Vol. IV, p. 192), says:

The character of the men employed in Illinois coal mines has changed. Formerly English, Scotch, Welsh, and Irish. At present there are some Germans, majority are Slavonians, Russians, Italians. This change has resulted partly from prejudices among old hand miners. When on account of competition and frequent labor troubles a cheap and reliable system became necessary and machines were introduced, there was a great deal of bitterness and the result was that nearly all the old miners left the business, either finding other occupations or leaving the State and a new race was introduced. Many operators think it doubtful whether machine mining would have been practicable without this introduction of foreign labor. The fact is, that under the present system coal mining in Illinois has either ceased or is fast ceasing to be a skilled occupation.

II. EFFECTS ON EMPLOYMENT.

At first sight the most important factor affecting changes in wages is the business activity touching the demand for coal. Not only do reductions in price of coal usually accompany business depression, but at such times the effects of machinery and surplus labor show themselves without restriction. There are two phases of this oversupply of labor—first, the chronic oversupply; second, the periodic oversupply. The following table shows for both anthracite and bituminous coal the annual product, the average price, and the number of days during the year that the mines are active:

TABLE 10.—*Product, price, and number of days active of anthracite and bituminous coal production in the United States.*¹

¹The Production of Coal in 1899, E. W. Parker, pp. 23, 24, 42, 43.

It can readily be seen from this table to what extreme fluctuations the coal industry is subjected. The average number of days per year during which the mines are operating varies from 171 to 234 in the bituminous fields and 150 to 203 in the anthracite field. That is to say, taking 306 days in the year working time in the bituminous mining, the average employment ranges from 57 per cent to 78 per cent of full time, and in anthracite mining from 50 per cent to 67 per cent of full time. Or, to state it differently, in the dullest year the amount of employment in bituminous mines is 73 per cent of the amount in the most prosperous year, and yet in the most prosperous year it is only 78 per cent of full time. And in the anthracite mines in the dullest year the amount of employment is 75 per cent of the amount in the most prosperous year, and yet in the most prosperous year it is only 67 per cent of full time.

¹Compiled from Reports of Pennsylvania Bureau of Industrial Statistics and Reports of Bureau of Mines.

The foregoing table shows the average number of days worked in the two coal fields of Pennsylvania and the per cent of possible time thus worked. It is seen that the average for the bituminous field is considerably higher than that of the anthracite. In 1892 the time worked and the percentage of possible time in the two regions were almost alike. In 1896 and 1897 the time in both had decreased, but in 1898 the time in the bituminous region was increased, while that of the anthracite had continued to decrease. In 1899 there was a large increase in both fields, especially in the bituminous mines.

The point of interest at this place is the percentage of possible time that both regions show in prosperous and adverse years. In 1892, a year of uniform and marked prosperity, the percentage of possible time worked was 68 and 67. This may be taken as indicative of the time that can be worked under the most favorable conditions. On the other hand, in years of depression a decline to 48 and 61 per cent is shown. It is evident, then, that the time worked in the Pennsylvania coal mines varies from one-half to two-thirds of the possible working time.

TABLE 12.—*Days worked in the mines of the States named from 1890 to 1899.*¹

Year.	Bituminous regions.						Anthracite, Pennsylvania.

¹ Parker, 1899, pp. 39-41.

The foregoing table, showing the days worked in the mines of the 5 principal coal States for 10 years, was compiled from the Production of Coal in 1899 (E. W. Parker). The highest number for any 1 of the 5 States in any 1 of the 10 years was Pennsylvania, bituminous, for 1899. This was 245 days, or 80 per cent of full time. At the other extreme, Ohio, in 1894, had an average of only 136 days for the year, or 44.4 per cent of full time. It is thus seen that even in an exceptionally prosperous year, and under other favorable conditions, like those in Pennsylvania bituminous and West Virginia mining in 1899, the maximum time is only 80 per cent of the possible working time.

¹ Compiled from Reports of Pennsylvania Bureau of Industrial Statistics.

The foregoing table shows the average number of days worked in each of 9 different industries selected from the 47 reported in the industrial statistics of Pennsylvania, the average for the total 47 industries, and also the average number of days worked in both the anthracite and bituminous field. The table is intended to show the small average time worked in the coal mines compared with that of manufacturing industries.

To simplify the comparison the following table has been made from the totals given by the Pennsylvania Bureau of Industrial Statistics, showing the percentage of possible time employed in the two mining regions of Pennsylvania and in the 47 industries investigated by the bureau.

TABLE 14.

	1892.	1896.	1897.	1898.
Industries (47).....	96	90.1	95.7	97.3
Anthracite coal.....	67.5	56.5	48.6	48.5
Bituminous coal.....	68.1	61.8	61.6	68.1

It is readily seen that the percentage of time employed in the bituminous field varied very little, and remained steady at from 60 to 70 per cent of possible time. The time in all the industries was from 80 to 97 per cent, so that, in fact, the miners in the bituminous field were working only about two-thirds of the time that the men in manufacture were working. On the other hand, the anthracite miner was much worse off, and worked only from 50 to 65 per cent as much time as men in manufacture, or 48 to 67 per cent of possible time.

On the average, then, the workers in iron, steel, cotton and woolen products, and in general manufactures have the opportunity to work from 35 to 50 per cent more of the total time per year than the coal miner in the anthracite field and from 30 to 40 per cent more than the bituminous miner.

This irregularity of employment naturally causes instability of application on the part of the miners. To a large extent they are a floating population. They pass from one mine to another. This makes it difficult to gain accurate information regarding the condition of the individual miners and their families. This is shown in the report of an investigation made by the Illinois bureau of labor statistics in 1890, wherein, among other data, is produced the following table with comments (p. XXVI):

TABLE 15.—*Seasonal irregularity of employment.*

	Whole number of men on pay roll of a mine in Sangamon County during the month.	Number of men required to pro- duce same ton- nage if at work full running time.
May	97	85
June	94	84
July	94	87
August	101	88
September	100	80
October	102	89
November	116	95
December	119	98
January	107	99
February	107	96
March	97	89
April	85	80
The year	210	90
Monthly average	102	90

"The figures in this column represent one of the chief difficulties presented in statistics of this kind. The smallest number of men employed in this mine in any given month was 85, in April; the largest number 119, in December. Between these extremes there is more or less fluctuation from month to month, and the average for all months is 102. It does not follow, however, that the greatest number employed in any one month is in fact the whole number of men who found employment during the year. On the contrary, there were 210 different men at work in this place during the year and only 45 of them worked continually throughout the year. * * *

"Of the 97 miners who were paid for labor in May, some never appeared on any subsequent pay roll, others continued to appear several months and then were found no more, while others still disappeared for several months and then began to work again. In like manner names were found on every pay roll which had not appeared on any previous one, and what was true in this case was found to be the characteristic of all coal mines. * * *

"In Establishment I, 320 miners received pay in July, and 466 in February, while for all other months the number fluctuates between these two extremes. The average number for the twelve months was 382 for each; that is to say, this number of men, if continually at work, could have performed all the labor which was required during the year at this mine. In fact, 84 more men worked in the busiest month and 62 less men in the midsummer months, but the greatest number of men employed in any month was far less than the whole number of persons who were given employment during the year. In fact, the names of 685 different men were found on the pay rolls of this company during the year, and, although an average of 382 were at work each month, only 160 of them worked every month in the year. It thus appears that 56 per cent of the whole number of men who worked in this mine, first and last, during the year was sufficient to perform all the labor done, and that only 28 per cent of the whole were constant workers throughout the year.

"The results summarized show that while the labor of 3,111 men, or the total of the various averages, was sufficient to mine and deliver the annual output of these

mines, there were, in fact, 5,356 individuals who shared that labor for a greater or less period. Only 869 men out of 5,356 actually maintained their places on the pay roll throughout this particular year, and the inference is justifiable, inasmuch as this was a fairly representative year, that a corresponding degree of fluctuations would be found in any given period of twelve months in any corresponding number of mines equally distributed throughout the State."

The excessive uncertainty of employment above described is more apparent than real, because miners are changing from one colliery to another, and would therefore appear to work only a short time, whereas, if all the mines in the State were examined, these individuals would be found at work for a longer period, although with different employers. At the same time, taking the industry as a whole, the over-supply both of equipment and labor is readily demonstrated. This appears in the Illinois Coal Reports of 1898 (p. 48) and 1899 (p. XXXIX), where it is stated that the possible output of the existing collieries of Illinois, if operated continuously with the present equipment, would produce, in 1894, 41,082,925 tons. The actual output in 1898 was 18,599,299 tons. Consequently the per cent of possible increase were the plants to operate continuously would have been 120.88 per cent. In 1899, assuming the same possible output, the increase would have been 75 per cent had the mines operated continuously, since the actual output had increased to 23,434,445 tons. These estimates are not based "on what might be produced if the hauling, hoisting, and handling facilities should be increased to their limit. The majority of first-class plants, which are the real producers of commercial coal, are capable of indefinite expansion to meet any reasonable demands which may arise in excess of their present capacity. Yet variation is found in the reports of individual mines. Some have a capacity for increase five and even seven fold; others none whatever, owing to the fact that the mineral is nearly or quite exhausted."

TABLE 16.—Average number of employees, days active, and yearly product of coal fields of Pennsylvania.¹

Year.	Anthracite.			Bituminous.		
	Average number of days active.	Average number employed.	Short tons product.	Average number of days active.	Average number employed.	Short tons product.
1890.....	200	126,000	46,468,641	232	61,333	42,302,173
1891.....	203	126,350	50,665,431	223	63,661	42,788,490

1899.....	173	139,606	60,418,005	245	82,812	74,150,175

¹ Parker, 1899, pp. 39-41.

In the above table comparing the number of employees, the days worked, and the product in short tons for the two fields of Pennsylvania, it is evident that an increase in the number of employees in the anthracite region meant not so much an increase in the amount of the resulting product as a decrease in the number of days worked per man. There was a steady increase in the mined product from 46,000,000 tons in 1890 to 60,000,000 tons in 1899. This was an increase of 30 per cent in product, the employees increased in number 11 per cent, and the average number of days active decreased 13.5 per cent. If, however, the year 1898 is compared with the year 1890, the increase in the product will be found to be 15 per cent and the increase in employees about 15.4 per cent, while the decrease in the number of days active, from 200 in 1890 to 152 in 1898, is represented by 24 per cent.

This difference between the product, number of employees, and days worked is brought out in comparing 1895 and 1896. An increase in employees, while tending to decrease the average days worked, in this case went with a decrease in the product mined.

The report of inspectors of coal mines, Pennsylvania (p. XI), 1896, says of the anthracite region: "There has been an increase in the number of employees every year since 1892. This does not mean, however, that there has been an increase in the number of days of employment each year, especially with reference to the increase between 1895 and 1896, as the reductions in the number of tons of coal mined is pretty strong evidence that while there has been an increase in the number of employees, there has been a decrease in the number of days employed."

The report further says (p. XII): "A somewhat different condition is found in the bituminous region with reference to the proportion of the number of employees to the number of tons of coal mined in each of the years named, for while there was a reduction in the number of tons of coal mined in the anthracite region, there appears to have been an increase in the number of employees. In the bituminous region there has been a decrease in number of tons of coal mined and a proportionate decrease in the number of employees, applying this comparison to the data returned for the years 1895 and 1896."

In the bituminous region it may be well to notice that the increase in the product from 1890 to 1899 was nearly 32,000,000 tons, or 75.2 per cent; the increase in the number employed was 21,000 persons, or 35 per cent, while the average number of days employed instead of having decreased 13.5 per cent, as in the anthracite field, actually increased 5.6 per cent over the average of 1890.

Comparing these percentages with those of the anthracite region, it is seen that the bituminous product increased by a percentage two and one-half times as large as the percentage of increase in the anthracite field; the percentage of employees was more than three times as large, and the average number of days worked was a gain of almost 6 per cent instead of a loss of almost 14 per cent.

There is a distinction in the character of bituminous and anthracite coal relative to the stability of operation. Bituminous coal can not economically be stored, as it disintegrates with exposure. Consequently the mining of that coal is a seasonable industry, like the clothing trade. In the busy season all of the miners are employed, and the output for the time is as great as the output of the mines. It can not, therefore, be said that there is a surplus of labor in busy seasons any more than it can be said that there is a surplus of carpenters and bricklayers because they can not find work in winter. But in anthracite mining it is different. Anthracite coal can, without much injury, be mined and stored during a dull season and the stock can be worked off during a busy season. The surplus of labor, therefore, is not merely seasonal, but is maintained more for the convenience of the operators than for the necessities of the trade.

Concerning the significance of the oversupply of labor in the anthracite mines, Mr. G. O. Virtue says (Bulletin of Department of Labor, Vol. II, p. 753):

The question of earnings is as much one of time as of rate. The daily earnings, though not high, are not unusually low for the grade of labor employed. The great evil is in the irregularity of employment. There are more than enough laborers in the region to man the collieries at their full capacity. But, as is well known, they are and for years have been kept idle a part of the time to prevent over-production. The Reading collieries were operated an average of 219.2 days for the six years 1885 to 1890, and for the six years 1890 to 1895 an average of 187.1 days. Of the 354 collieries whose time was reported by the inspectors of mines in 1894 only 20 per cent ran 200 days and over; more than 30 per cent ran but half time and less. It is easy to believe that the estimate of 67,000,000 tons as the capacity of the mines is not too high, while in 1896 only 43,200,000 tons were produced.

A restriction of production is necessary if profits are to be earned upon the investments made; but as now effected it is wasteful in the extreme. Each company is compelled to maintain itself on a war footing, and aggravates the difficulties by increasing its capacity each year beyond the growth of the market. A restriction which would bring about the closing of the poorest mines and keep only the best running at their full capacity would have the advantage of a lower cost of production, and would also correct, though not remove, the evil of the irregularity of employment. Owing to the periodicity of the demand for coal, it will always be present in some degree. This mode of restriction would undoubtedly mean the departure of many who are now held at the mines by the vain hope of more work next month. But such a mode of restriction can not be expected so long as the ownership of the mines remains, as now, divided among the eleven carrying companies which serve the field, each vitally interested in the question as to whose collieries shall be closed.

III. MACHINE MINING.

The most important change which has taken place in the mining of bituminous coal in the past 15 years has been the introduction of machinery. Illinois took the lead in this development, and as early as 1888 there were 272 machines in the State, mining 20 per cent of the whole output by the labor of 10 per cent of the men. (Illinois Bureau of Labor Statistics, 1888, p. 338.) The following table exhibits for the leading bituminous States the introduction of machinery:

TABLE 17.—Percentage of total product mined by machines.¹

Year.	Pennsylvania.	Ohio.	Indiana.	Illinois.	West Virginia.	Total for United States.
1891.....	1.01	12.85	7.16	19.33	2.23	6.66
1896.....	12.29	26.16	24.69	19.57	3.35	14.17
1897.....	16.35	31.51	24.65	19.66	4.73	16.19
1898.....	25.34	35.76	28.74	18.36	7.93	20.89
1899.....	29.67	41.35	28.52	24.90	9.27	23.00

¹Parker, 1899, p. 63.

The effect of machinery is seen, first, in the reduction of prices and, second, in its effect on wages.

The reduction in prices may be inferred from the marked economy of the machine method. The Report of the Illinois Bureau of Labor Statistics for 1888 contains examples of the economy of machine production, among which is the following (p. 391):

A company at Peoria got the machine-mined coal shot down, loaded to the rooms, and timbered for 32½ cents per ton, making the machine mined coal cost the company 50½ cents per ton, or, considering the engineer's wages, wear and tear in machines, and interest on capital, etc., it cost nearly 55 cents per ton. Compared with hand mining prices in the past year in the same locality (which were 75 cents in summer and 80 cents in winter) there is a material difference.

The effect of these economies may be seen in the prices of bituminous coal on the markets. The following table shows for the leading States and for the United States that there has been a steady decline in prices from 1886 to 1898, with a recovery of 7 cents per ton in 1899:

TABLE 18.—Average prices for bituminous coal at the mines, 1886-1899.¹

Year.	Pennsylvania.	Ohio.	Indiana.	Illinois.	West Virginia.	Total for United States.
1886.....	\$0.80	\$0.95	\$1.15	\$1.11	\$0.94	\$1.06
1887.....	.90	.88	1.34	1.09	.95	1.12
1888.....	.95	.93	1.40	1.12	1.10	1.00
1889.....	.77	.93	1.02	.97	.82	1.00

1897.....	.69	.78	.84	.72	.63	.81
1898.....	.67	.83	.81	.78	.61	.80
1899.....	.76	.87	.88	.85	.63	.87

¹ Parker, 1899, p. 42.

The Report of the Illinois Bureau of Labor Statistics for 1888 (p. 338) explains the changes effected not only in the cost of production, but also in the wages of machine miners (p. 339): "A mining machine not only reverses the methods of work, but it equally changes the system of wages. The coal miner proper takes his own tools into the pit and undertakes to deliver from the wall of mineral before him certain tons of coal ready every morning for a certain sum per ton. He mines and drills and blasts and loads his own coal, timbers his own roof, takes care of his own tools, and is responsible mainly to himself for his personal safety and the amount of his output.

"In the machine mine it takes 7 or 8 men to perform these various functions, and in the mine, as in the mill, the machine is the master and the men are its servitors; the operator and the mechanism simply directs its energies when the motive power is given to it and the coal is undercut or mined. A blaster follows with tools and explosives, loosening the mass; the loaders reduce it and shovel it into pit cars; the timbermen follow and prop the roof, which no longer has the mineral to rest upon. Laborers assist in every process, and a machinist is retained for repairs. Each one does his own certain portion of the work and no more, and doubtless does it better, as well as faster, by reason of his greater skill thus acquired. Herein lies the chief value of the machine to the mine owner. It relieves him for the most part of skilled labor and of all the restraints which that implies. It opens to him the whole labor market from which to recruit his force; it enables him to concentrate the work of the mine at given points, and it admits of the gradation of wages to specific work and payment of wages by the day.

"The results of this introduction of machinery," continues the Illinois report (p. 339), "consist not only in the greater execution of the machine, but in the subdivision of labor which it involves, and the greater per capita efficiency of the force thus secured. The gain is consequently to the employer rather than to the men. The mining machine is in fact the natural enemy of the coal miner; it destroys the value of his skill and experience, obliterates his trade, and reduces him to the rank of a common laborer or machine driver if he remains where it is."

The foregoing complaints of the Illinois bureau of labor statistics in 1888 find apparent verification in certain statistical tables published in the report of the same office for 1890. These are in the form of returns from typical hand and machine

mines in different parts of the State. Seeing that the mines operate under a wide variety of circumstances, it is difficult to make average comparisons, but the following selections may be made of mines in neighboring localities and similar circumstances.

TABLE 19.

Establishment X, Macoupin County, hand mining.

[Conditions: Depth of shaft, 420 feet; thickness of coal, 8 feet; working places, dry; system of working, pillar-and-room; mining done by hand; price of mining, 50 cents a ton for screened coal; seam level and uniform.]

Occupation.	Number of men.	Per cent of total number.	Average daily earnings.
Miners	205	58.75	\$1.83
Laborers	74	21.20	1.63
All others	70	22.05	1.75
Total and average	349	100.00	1.81

¹ Illinois Bureau of Labor Statistics, 1890, pp. 184, 193.

Establishment XI, Madison County, machine mining.¹

[Conditions: Depth of shaft, 168 feet; thickness of coal, 7 feet; working places, dry; system of working, pillar-and-room; mining done with machines, operatives paid from \$1.25 to \$2.50 a day; seam level and uniform.]

Occupation.	Number of men.	Per cent of total number.	Average daily earnings.
Cutters	8	3.74	\$2.25
Blasters	9	4.20	2.22
Timbermen	10	4.67	1.99
		12.61	
Helpers	31	14.48	1.63
Loaders	109	50.92	1.77
		65.40	
All others	47	21.99	1.63
Total and average	214	100.00	1.77

¹ Illinois Bureau of Labor Statistics, 1890, pp. 195, 201.

An examination of the foregoing table shows that the average wages of all employees in the hand mine are \$1.81 per day, and of all employees in the machine mine are \$1.77. It also shows that the wages of loaders, laborers, helpers, and all others are about equal in both mines, viz., \$1.63 to \$1.75 in the hand mine and \$1.63 to \$1.77 in the machine mine. On the other hand, it shows that the miners or skilled laborers who received \$1.83 per day in the hand mine are displaced by cutters and blasters who receive \$2.22 to \$2.25 per day, an increase of about 22 per cent in wages. But the cutters and blasters who take the places of the miners are only 8 per cent of the total number employed in the machine mine, whereas the displaced miners were 60 per cent of the total number employed in the hand mine.

Similar results follow in comparing hand and machine mines in Lasalle County under similar conditions.

TABLE 20.

Establishment IV, Lasalle County, hand mining.¹

[Conditions: Depth of shaft, 110 feet; thickness of coal, 5½ feet; workings, wet; system of working, pillar and room; mining done by hand; price of mining, 80 cents a ton for screened coal.]

Total	522	100	1.97

¹ Illinois Bureau of Labor Statistics, 1890, pp. 101, 113.

² \$2.28 average daily earnings.

In examining the above tables it is seen that the average earnings per day in the hand mines are \$2.37 and \$3, but in the machine mines are only \$1.97. In establishment No. IV (hand mining) the miners were 71.2 per cent of the men, with wages at \$3.21 per day, and in No. VI (hand mining) they were 70.14 per cent, with an average wage of \$2.72 per day. On the other hand, in establishment No. V (machine mining) the cutters, blasters, and timbermen were 9.37 per cent of the employees and received an average of \$2.28 per day. In other words, the hand miners in Establishment IV received 40.3 per cent more than the average wage of cutters, blasters, and timbermen, and 35 per cent more than the cutters alone in the machine mine. Establishment No. VI also shows wages 19.3 per cent higher for the hand miners than for the cutters and blasters in the fifth, or a higher wage by 12.8 per cent than that for the cutters alone. Even the hand miners in the same mine where machinery was used showed an average wage of \$2.53 per day as against \$2.41 for the cutters, or a wage of 5 per cent higher in favor of the hand method.

A different showing from the foregoing establishments in Illinois is made in the comparison of 2 establishments under hand and machine method by the United States Commissioner of Labor (Report on Hand and Machine Labor, 1899, p. 1579). The following table is computed from the data given in that report. It appears that in establishment No. 654 under hand methods the average wages were 13.4 cents per hour, while in the same establishment 2 years later under machine methods the average wages were 22.1 cents per hour, an increase of 20 per cent. In this case the loaders received an increase of 2 cents per hour and the driver 5 cents per hour, while the operator and helper who took the places of the miners received, respectively, 55 and 25 cents per hour in place of the 18 cents received by the displaced miners.

In establishment No. 655 the average wages increased from 22.1 to 22.5 cents per hour on the substitution of machine methods. In this case the operatives received 25.7 cents in place of 22.8 cents received by the displaced hand miners, and the wages of other classes of workers were not increased.

It will be seen that in these two establishments reported by the Commissioner of Labor, notwithstanding the higher average wages, the cost of mining was reduced from 71.2 cents per ton to 42.3 cents in No. 654 and from 77.6 to 42.4 cents in No. 655. Allowing 5 cents per ton for interest, depreciation, etc., on the machinery, the reduction in cost was 24 cents, or 33.7 per cent, in No. 654 and 30.2 cents, or 38.9 per cent, in No. 655. The number of men required to operate the mine was reduced from 93 to 60 in No. 654 and from 42 to 32 in No. 655.

Comparing now the somewhat contradictory results derived from the reports of the Illinois bureau and from the Department of Labor, it is evident that local circumstances play a large part in the effect on wages where machinery is introduced. The following inferences may be drawn:

1. Notwithstanding the large reduction in the number of workers required for a given output, it is to be expected that, in time of prosperity, when the output is largely increased, the surplus labor will be absorbed; and, on the other hand, in a period of depression the number will be reduced. This inference is borne out by the following table, showing the number of employees in bituminous mines for the leading States and for the United States for the years 1890 to 1899:

TABLE 22.—Average number employed in bituminous mines.¹

Year.	Pennsyl- vania.	Ohio.	Indiana.	Illinois.	West Vir- ginia.	Total for United States.
1890.....	61,333	20,576	5,489	28,574	12,236	192,204

1899.....	82,812	26,038	9,712	36,765	23,625	271,027

¹ Parker, 1899.

It appears that in the country at large the number employed showed an annual increase except for the year 1895, and since 1895 the number increased to the extent of 31,065 men, or about 13 per cent. From Table 23 it is seen that the product also showed an annual increase except in the years 1890 and 1895, and since 1895 it has shown an increase of 74,501,582 tons, or 62 per cent. In the State of Illinois, however, the number employed in 1899 was 2,804 less than in 1896, notwithstanding an increase in the product of 4,652,293 tons, or 23.5 per cent. On the whole, it is evident that increasing prosperity overcomes the displacing effect of machinery, but business depression displaces labor whether machinery is introduced or not.

¹ Parker, 1899.

2. The large economy in machine methods makes it possible to pay much higher wages with increased profit to capital and without reducing the price of the product.

3. The most important local circumstance which determines whether the mine worker shall gain an increase in wages with the introduction of machinery is the state of his labor organization. This is shown in the following table, which gives the results for Illinois of the strike of 1897, at which time the coal miners, for the first time, perfected an organization of remarkable strength.

Table 24, reproduced from the Illinois Coal Report for 1898, shows, by districts and by hand and machine mines, the number of men included in the strike of 1897, the average duration of the strike, the price for mining before and after the strike, and

the average gain. It will be seen that the average gain in machine mines was 36.3 per cent, whereas the average for all mines (including machine mines) was 26.4 per cent.

¹ Illinois Coal Report, 1897, Appendix (compiled).

The foregoing table shows the gain in prices immediately before and after the strike of 1897. The following table shows that for the year 1899, following the increase in prices secured at the beginning of that year, the average price for hand mining had been increased 49.38 per cent, and the average price for machine mining had been increased 42.77 per cent.

TABLE 25.—Average prices, machine mining and hand mining, 1897 and 1899 (Illinois).¹

	1897.	1899.	Increase per cent.
	<i>Cents.</i>	<i>Cents.</i>	
Machine mining	21.95	31.34	42.77
Hand mining	31.53	47.1	49.38

¹ Illinois Coal Report, 1897, p. 182; 1899, p. XLV.

The Report for 1900 shows a still further increase in the prices of hand mining to 49.3 cents, an increase of 56.6 per cent since 1897, and in the prices of machine mining to 35.78 cents, an increase of 62.7 per cent since 1897.

The effect of labor organization on the prices and earnings of machine miners is shown in even more striking form by the following table. This gives the scale of prices for hand mining and machine mining as agreed upon in the interstate conferences of 1900 and 1901 for the basing districts of Pennsylvania, Indiana, Ohio, and Illinois. It will be seen that in Illinois, where the union is especially strong, the machine price for the basing district, Danville, which is fixed by the interstate conferences, is 10 cents below the hand price, but for the other districts of the State, where the prices are fixed by the State organization, the differential is only 7 cents. On the other hand, for the States of Ohio and Pennsylvania, where the unions have developed less strength, the differential is 19.2 cents. These discriminations in the differentials against Illinois account for the fact, which appears in Table 17, that the adoption of mining machinery in Illinois has not progressed as rapidly as in Ohio and Pennsylvania.

TABLE 26.—Comparative prices for pick and machine mining (per ton), 1900–1901.

	Illinois.		Indiana, bitumi- nous.	Ohio, Hocking Valley.	Pennsyl- vania.

Machine	39	42	36.5	37.8	37.8
Differential	10	7	12.5	19.2	19.2

The conclusion to be drawn from these considerations is that the miner is able to gain from the introduction of machinery, provided he is able to organize, but without organization he does not gain.

IV. LABOR ORGANIZATIONS IN COAL MINING.

Considering that in the foregoing discussion of machinery we are brought to the conclusion that the decisive factor in elevating the wages of mine workers is the circumstances of their organization, our inquiry into the effect both of immigration and machinery upon wages must concern itself largely with their effect upon organization. It will here be seen that we reach the crucial problem of immigration.

In the matter of organization, the mine workers have passed through extraordinary vicissitudes. The early miners were English, Welsh, Scotch, and Irish, and the first union was organized among them in the anthracite region by an Englishman, Bates, in 1849.¹ This was broken the same year. During the civil war the prosperity of the miners was so great that little need of organization was felt. It was not until 1868 that the first comprehensive organization was effected—that of the Workingmen's Benevolent Association. This spread through both the anthracite and bituminous fields. This was not recognized as a national union until 1873, when a convention was held at Youngstown, Ohio. In the strikes which followed from 1873 to 1875 against reduction of wages, following the reduction of prices, the union was defeated, and in 1875 was destroyed. In the anthracite region it had become confused with the Molly Maguires, although the two were separate. It was about this time, beginning in 1870, that the large importations of labor from southern Europe were inaugurated, under the impulse of what is believed by the miners to have been a new policy of the operators to maintain a supply of labor always on hand equal to three men for every job. But however this may be, the failure of the strike of 1875 was not owing to the presence of these immigrants. The miners were defeated outright as the result of a strike against a falling market. They accepted substantial reductions in wages, but even more important than normal wages were the loss of their organization and the consequent transference to the operators of all control over the measurement of coal and the employment of newcomers.

There was no organization of miners which could rightly be termed national in scope from 1875 until 1897 in the bituminous field and 1900 in the anthracite field. There were local organizations in Ohio, Indiana, Illinois, and Pennsylvania in the bituminous fields, and the Knights of Labor had a considerable membership in its mixed assemblies. In 1885 these locals of the mine workers secured the right from the Knights of Labor, after it had previously been refused, to form a national trades assembly of their own craft, thus separating them out from the mixed assemblies where their interests were subject to the influence of other crafts. It was this assembly of the Knights of Labor which, in 1887, made demands for increase of wages in the anthracite region and was utterly defeated and destroyed. The defeat at this time is ascribed with unanimity to the presence of the cheap labor of southern Europe, which could not be controlled and organized according to the methods then pursued. The operators were able to play one section against another section and one nationality against another nationality.

In 1885, as a result of the refusal of the Knights of Labor to grant a national trades assembly to the miners, a separate convention of representatives of local and State unions was called and met at Indianapolis, where was formed the Federation of Miners and Mine Laborers. This had no connection with the Knights of Labor, but it forced the Knights shortly thereafter to recognize the National Trades Assembly, as stated above, exclusively comprised of miners. These two national bodies competed for jurisdiction, but after various negotiations they effected a consolidation in 1890 at Columbus, Ohio, under the title of United Mine Workers, wherein it was agreed that the two bodies should retain separate organizations, but should elect identical officers. This arrangement ultimately fell to pieces in 1895, since when the present order of the United Mine Workers has had no connection with the Knights of Labor, and retains its place as a branch of the American Federation of Labor.

The United Mine Workers had a precarious existence for several years. In 1890 they were strongly organized in the coke region, but when in that year the national body refused to indorse a local strike and the men went out on their own account, they were completely defeated; 11 Slavs were killed in the "Morewood massacre," and no organization has arisen to take the place of the one destroyed.

The first national strike of the United Mine Workers was called in 1894. This was not intended to be a strike but only a cessation of work to enable the overstocked markets to become depleted. But the original purpose was lost sight of, and it became a practical strike, lasting some 3 months. A compromise was effected

¹ Bulletin, Vol. II, p. 732.

with a portion of the operatives in Ohio, Indiana, and Pennsylvania, but there was utter defeat in Illinois. The result was a falling off in membership, which reached in 1897 the low point of 10,000 members.

At this time the depression had carried wages so low that the miners were desperate, and it was this desperation upon which has been based the apparently powerful organization of the present time. A general strike was ordered for July 4, 1897, to restore the wages of 1893. This continued 2 to 3 months, and although the union began this strike with only 10,000 members and no treasury, it ended with practically all the miners of the States affected and a favorable treasury. The strike resulted in the advances demanded. In Illinois, where the miners had been treated more arbitrarily and oppressively than in other States, they stood out a month longer than in other States and secured demands considerably beyond those gained elsewhere. They gained not only an increase in wages, but also the universal payment by run of the mine, the "check-off system," whereby the operators actually collect the union dues and pay them over to the treasurer of the union, and other substantial advantages.

In this same year, 1897, the miners of the anthracite region were not successful, one of the incidents of the strike in that section being the famous "Hazleton massacre," where a large body of Austro-Hungarians was fired upon by the militia. But in the summer of 1900 the anthracite miners were called out by the union, although they were not all organized. They, however, responded, joined the union, and although the union was not recognized by the operators, as had been the case in the bituminous field, yet the desired advance of 10 per cent, and the reduction in the price of powder, was granted.

The remarkable and interesting feature of the United Mine Workers is the annual conference with the Bituminous Mine Operators, for the purpose of establishing a scale of wages and conditions of work in the several districts of the competitive field. The first interstate conference of this kind was held in Chicago in January, 1898, following the successful strike of the preceding year. The second conference was held in Pittsburg in 1899, the third in Indianapolis in 1900, and the fourth in Columbus in February, 1901. It is not necessary at this point to describe in detail the nature of these annual conferences, except in so far as they are concerned with the problem of organization and discipline of the diversified races and nationalities in the mining industry. The conferences are supposed to include all of the mine operators and the representatives of all the mine workers in the competitive field. At the present time the States included are Pennsylvania, Ohio, Indiana, and Illinois. The State of West Virginia, which is also in competition with the above four States is not included, because the mine workers have not yet succeeded in organizing the miners.

At these conferences the mine operators appear as an associated body of some 200 firms and corporations, and the 150,000 mine workers appear through their 600 representatives elected from the local unions. This is doubtless the largest industrial parliament in the world in point of numbers. Indeed, the numbers are too large for deliberation, and the real work of agreeing on a scale is done in a small committee of the leading officers and representatives of the two bodies. In the annual conferences held in other trades—such as those of the iron molders, etc.—only the executive officers take part. But in the case of the mine workers it is necessary not only to make an agreement with the employers, but it is even more important to educate the rank and file in a spirit of acquiescence to that agreement. This can be successfully done only by a widely representative body. Each local union throughout a widespread territory sends its chosen spokesman with its particular grievance and demands. This spokesman after listening to the debates for several days is impressed with the conflicting demands and the need of compromise, if any agreement whatever is to be made. When the agreement finally is made by the small committee, he is prepared not only to ratify it, but to return to his local union with a complete account of the negotiations, the difficulties and obstacles, and the necessity of their yielding a part of their demands and their accepting and abiding by what could be obtained for them. In this way each delegate becomes an educational force in his locality on the principles of trade unionism and the obligations of the contracts into which they have entered. Although the expense is very great, yet it is a necessary expense in the present stage of the industrial education of the most refractory constituency that a labor organization was ever called upon to handle.

Additional details in the problem of organization of the mine workers are interesting. In the earlier form of local organization it was usual to organize each nationality separately, in its own branch, in order that it might conduct its business in its own language, and then meet the other branches through a chosen representative. Two objections to this form of organization were raised. First, the non-English miners themselves objected, because they lost incentive to learn the English language as long as it was possible to carry on their business in their native language.

Second, the organization by nationalities brought together workmen from different mines whose legislative problems were different, and this resulted in useless complication. For these two reasons, at the present time the local unions are organized as English-speaking unions for each mine or district. The non-English members are always represented in the executive board. Usually the president is English, Irish, or Welsh, and the other officers are Italian, Polish, Slovak, Lithuanian, etc., as the case may be. The business must be translated for the benefit of the several nationalities, and it often happens that three or four translations are required at a single meeting, so various are the languages spoken.

It is an interesting fact to notice that the majority of the delegates to the State and interstate conferences, as well as the leading officers of the miner's unions, are Irish or Irish-Americans. Naturally the delegates would be English-speaking persons, but the predominance of Irishmen is far beyond their proportion among the miners. It is evident that the Irishman possesses peculiar gifts in bringing together and organizing conflicting nationalities, races, and religions. In the miners' union his leadership is based on his amiability, his shrewdness in negotiation with the employers, and his firmness in enforcing the agreements upon his own membership.

Competition of native Americans.—Considering the fact, which is abundantly demonstrated, that the only force competent to check the fall of wages or to force a rise of wages in the mining industry is a thorough organization of the miners, it is necessary to inquire whether the presence of antagonistic nationalities has stood in the way of organization. It is unquestionably true that this is the case. Were it not for the difficulties of language, the antipathy of race, and the jealousies of religion, the problem of labor organization would have been much easier, and organization would not have delayed so long. But, at the same time, it can not be said that these race problems are confined to foreign races. The jeopardy and defeat of the unions has been owing as often to the competition of unorganized Americans of native stock, in new fields, as in the competition of the foreign born. This is fully demonstrated by the experience of the miners prior to 1897, when they were defeated by the competition of southern Illinois, and, since 1897, when they are jeopardized by the competition of West Virginia. Beginning with 1886, as already stated, the local organization of miners known as the Federation of Miners and Mine Laborers acquired such strength that it was able to summon the operators of Pennsylvania, Ohio, and Illinois to annual conferences for the purpose of agreements regarding the scale of wages in these competitive States. These conferences continued until 1893, when they finally went to pieces, not to be resumed until 1898 on a larger scale by the larger union. During the entire period of these interstate conferences, from 1886 to 1893, it had been impossible for the unions to organize southern Illinois. The miners in that section were predominately Americans. They were farm laborers who had turned to the mines as a source of ready cash. The following table reproduced from Table 9, p. 303, shows the prevailing nationalities of the several districts, the sixth and seventh districts being in the southern part of the State:

TABLE 27.—Percentage of foreign born and native born miners in Illinois, 1899.¹

Divisions.	Total number employed.	Per cent Americans.	Per cent foreign born.	Total.
First	7,498	11	89	100
Second	6,631	28	72	100
Third	1,799	69	31	100
Fourth	4,655	38	62	100
Fifth	6,401	52	48	100
Sixth	6,008	49	51	100
Seventh	4,969	80	20	100

¹ Illinois Coal Report, 1899, p. LXXII.

The American-born miners were found in the southern districts, where their rates per ton for mining coal were 28 to 38 cents, as compared with 62 to 70 cents in the northern fields. The nature of the mining differed, however, so that, on account of the thickness of the veins, the southern miner averaged from $4\frac{1}{2}$ to $5\frac{1}{2}$ tons per day, while the northern miner's average product was but 2.6 to 2.7 tons. But, notwithstanding the greater productivity, the price per ton had been reduced so low that the earnings in the southern division were actually lower than those in the northern districts, averaging from \$1.53 to \$1.72 per day, while in the north the rate was \$1.68 to \$1.90 per day. (See Table 28.) Since the strike the earnings have increased throughout the State, but the increase has not been marked in the northern mines.

A comparative view of these gains is shown in Table 24 and in the following tables

derived from the Illinois Coal Reports. The rate per cent of gain indicates a low price before the strike rather than a high price after. It is to be noted that the high gains are in the southern districts, where the miners are of American stock, and where they had never hitherto been brought into an effective organization, and the low gains are in the northern districts, where the foreign-born miners of Polish, Lithuanian, and Italian stock predominated. The explanation of these divergences will be given below.

TABLE 28.—*Earnings of Illinois coal miners before and after organization.*¹

Districts.	Average number tons mined per man per day, 1896.	Average amount earned each day.		Increase, per cent.	Average yearly wages.		Increase, per cent.
		1896.	1899.		1896.	1899.	
First.....	2.70	\$1.90	\$2.01	5.8	\$299.39	\$378.00
Second.....	2.60	1.68	1.96	16.6	232.33	415.91
Third.....	3.04	1.78	1.90	6.8	280.34	288.96

¹ Illinois Coal Report, 1896, p. 21; 1899, p. L.

Going a step further and comparing the prices on hand mining for 1897 with the scale of prices agreed upon by conference of miners and operators in 1900 and 1901, we have the following increase:

TABLE 29.—*Results of the strikes of 1897.*

Cities.	Before strike, 1897.	Scale for 1900.	Increase, per cent.
	<i>Cents.</i>	<i>Cents.</i>	
Wilmington.....	67.5	81	20
Peoria.....	40	56	40
Danville.....	30	49	63
Springfield.....	31.9	49.7	55.6
Pana.....	25.9	49	89
Belleville.....	25	49	96
Duquoin.....	25.5	45	96

In will be seen, in examining the two preceding tables, that whereas before the strike of 1897 the average daily earnings in the southern districts were less than in the northern districts, yet since the strike the earnings in the southern districts are 35 to 40 cents per day above those in the northern districts; and that the increase in prices in such southern districts as Pana, Belleville, and Duquoin for 1900 have been 89 to 98 per cent above the prices of 1896, but the increases in northern districts are 20 to 40 per cent.

"The greatest average gain over former prices was secured in the southern part of the State, where prices had been less; the least, in the region of Rock Island, where there had been less complaint of prices. This average for the Rock Island field is the average for all the men involved, including those who received no advance. Those who really obtained a gain received about 5 per cent over former prices. The men in the Springfield, Danville, and Streator fields fared about equally well in an advance of substantially 20 per cent. The Belleville and Duquoin miners are credited with an advance in round numbers of 50 per cent, and the Pana, Mount Olive, and Virden men with a gain of 25 per cent. In a more general way it may be said that the advance in the Peoria field was 10 per cent, and in the Braidwood-La Salle field 15 per cent. For the State at large, reducing all percentages to one, the gain was 26.42 per cent." (Illinois Coal Report, 1897, p. 184.)

When it is noted that, at the time when 25 cents was being paid in the Belleville district, the price in the Wilmington field was as high as 67½ cents, it will be seen to what disadvantages the other fields were subjected. According to the agreement in price for 1900 the price in the Belleville district is 49 cents—nearly 100 per cent above the price for 1897—whereas the highest price in the State is 81 cents, for the

Wilmington district, an increase of 21 per cent. In other words, whereas in 1897 the price paid in the Wilmington district was 2.7 times greater than that in Belleville, yet in 1900 the price in Wilmington is only 1.6 times greater. This shows the peculiar equalizing principle which the miners' union has introduced.

This principle is not that of equalizing earnings, as is often asserted, but that of equalizing competitive conditions. That earnings have not been equalized is shown by the foregoing table (see Table 28), giving by districts the average earnings per day and the average earnings per year. In the southern districts, where daily earnings were increased 33.7 and 51.3 per cent, they were in 1899 \$2.30 and \$2.40 per day, compared with \$2.01 and \$1.96 per day in the northern districts, where the increases were only 5.8 and 16.6 per cent. In other words, in order to protect the miners in the northern, thin-veined districts, and permit their coal to come into the market at living wages, the union has forced the miners in the southern, thick-veined districts to increase their earnings from the lowest in the State to the highest in the State. This is one of the necessities of the system of differentials in arranging scales of prices for different sections of the same competitive field, and it was exactly the evil of the former unorganized condition that the American miners in the southern field had reduced their compensation so low, notwithstanding the greater productivity of the mines, that they were earning less than the meager wages of the foreign-born miners in the northern fields. It was the strategic position held by the cheap labor of the southern district that compelled the union to control that labor in the interest of living wages for their fellow-miners in other parts of the State. The present high wages of the southern field are not, therefore, owing to a higher standard of living or superior capacity for organization of Americans as compared with foreigners, but are owing to the initiative and interference of foreigners, who, in self-protection, forced the Americans to a higher position than the one they were willing to accept.

West Virginia.—Just as southern Illinois prior to 1897, with its native American stock and its thick vein of coal, defeated the efforts of the miners' union to raise wages and maintain a high standard of living, so West Virginia at the present time threatens to play a similar part in the larger movement of the reorganized union. By consulting Table 5 it will be seen that in West Virginia in 1890 the foreign-born miners were only 13.4 per cent of the total number, compared with 58.1 per cent in Pennsylvania, 57.4 per cent in Illinois, 31.8 per cent in Ohio, and 33.7 per cent in Indiana. The native whites of native parents were 57.5 per cent of the total number, compared with 19.7, 47.6, 48.2, and 21.3 per cent in other States. On the other hand, colored miners in West Virginia number 20.9 per cent of the total number, compared with 0.7, 2.3, 2.7, and 2.5 per cent in other States.

Since there is no uniform scale of wages and prices in West Virginia as in the other States governed by the interstate agreement, it is impossible to give a comparative showing which will represent the entire State. In West Virginia payment is usually made by the "box," which was originally supposed to contain 2 to 3 tons, but owing to the absence of a checkweighman, it is believed that these boxes have been gradually increased in size until they hold a larger weight. On the basis of 45 cents per box of 2 to 3 tons, which is the price in certain mines, the price per ton of 2,240 pounds is 15 to 22.5 cents. This should be compared with the price of 43 cents per ton in the thick vein of the Pittsburg district and 42 cents, the lowest price in the thick veins of Illinois. The following table shows in a comparative way for the year 1900 the prices for mining and the wages of inside day laborers in this particular section of West Virginia and in the four States of the interstate conference. It will be seen that prices and wages in West Virginia are 30 to 70 per cent below those under similar conditions in the other States:

TABLE 30.—*Prices for mining coal and wages of mine workers, 1900.*

¹ Thin vein.

² Thick vein.

The significance of the West Virginia product is shown partly by the annual increase in that State compared with the increase in competitive States. (See Table 23.) This increase is especially marked since the organization of the miners' union

in the other States in 1897. It will be seen by the table that the product steadily increased from 10,708,578 tons in 1893 to 19,252,995 tons in 1899, nearly 100 per cent. Whereas the product of Illinois, which was 19,949,564 tons in 1893, after falling off in 1894 and 1895, increased to 24,439,019 tons in 1899, an increase of 22 per cent. Pennsylvania increased 68 per cent in the same period.

Referring to the increased output of West Virginia compared with other States where the miners' union gained control in 1897, the commissioner of labor of West Virginia says in report for 1897-98 (p. 63):

Of 18,000 men employed in the coal mines of West Virginia, but 206 in the Pan-Handle district report organization in the United Mine Workers of America at the beginning of the strike and subject to the strike call of the executive officers. Beyond suspension of the mines in the Pan-Handle, where the organized operatives were employed, the mining industry of the State was not affected early in the struggle, except to appreciate the stimulus of an increased demand caused by the scarcity of coal in the market. The operators in many parts of the State increased the wages of their men, and paid a bonus, sharing with them the profit of an increased business activity and advanced price of their product. In 1894 the West Virginia operators secured in this way new trade and market, which the excellence of West Virginia coal enabled them to hold after the termination of the strike, and secured to them and their employees great permanent benefit.

The number of persons employed in West Virginia has also steadily increased, whereas the number has actually declined in Illinois since 1896, in Ohio since 1898, and has increased at a much less ratio in Pennsylvania and Indiana. (See Table 22.)

Even more significant are the prices at which the coal was sold. (See Table 18.) Whereas the average prices for coal for the United States rose from 80 cents in 1898 to 87 cents in 1899, and the prices in the competitive States rose 4 cents per ton in Ohio to 9 cents in Pennsylvania, the price in West Virginia rose from 61 to 63 cents, showing the ability of that State to retain cheap labor while other States were required to pay higher wages.

The number of days of operation of the mines conveys a similar lesson. (See Table 12.) The number of days of activity in West Virginia (242) in 1899 exceeded that in other States, except Pennsylvania (200, 218, 228, 245), showing relatively steady employment on account of steady sales for coal.

The low level of wages in West Virginia may be inferred from the low rate of introduction of machinery. The table (see Table 17), giving the proportion of the bituminous coal mined by machinery in the States named, and in the United States, shows that the proportion in West Virginia (9.27 per cent) is less than one-third of that in Pennsylvania (29.67 per cent) and Indiana (28.52 per cent) and less than one-fourth of that in Ohio (41.35 per cent).

The foregoing data and considerations relative to West Virginia are fully appreciated by the operators and miners in the competitive States, as may be seen by consulting the stenographic reports of their interstate conferences. The agreements and scales of wages established in these conferences are becoming more seriously jeopardized every year on account of the competition of the unorganized field of West Virginia. The significance of these considerations for our present purpose is twofold; the miners of West Virginia are mainly native Americans, who have only recently turned from home industry to mining, and the coal veins are thick and the coal is abundant and easily mined. These are the conditions, rather than foreign immigration, which at the present time operate as obstacles to the improvement of miners' wages in the bituminous fields.

Restrictions on the number of miners.—An important restriction introduced by the Miners' Union of Illinois, and one which marks that section of the union as distinctly stronger than any other section, is the initiation fee and apprenticeship period. This is designed especially to keep farmers out of the mines, but it plainly operates with the same effect upon immigrants. A "practical miner" is one who satisfies the officers of the local union that he is practical, and the officers are very strict in their interpretation of the term. Such a miner is admitted to the union and permitted to go to the face of the coal and have charge of a room, on payment of an initiation fee of \$10. An "unpractical miner" must pay \$10 to join the union, and then he is allowed to work only as a "top man" for a year. At the end of a year he can go below and work as a "mine laborer," in company with a practical miner, assisting in the loading, etc. At this step he pays an additional fee of \$10. Here he must work two years before he can have charge of a room to himself; and at this final stage, when he finishes his 3 years of apprenticeship, he pays an additional fee of \$10. This total initiation fee of \$30 indicates, as well as any other symptom, the strength of the Illinois union, compared with that of other States, where the aggregate fee is \$5 or \$10.

It is true that when the "unpractical miner" goes into a room with a practical miner he gets equal pay with the miner, since the union has prohibited the former practice of subcontracting. But it will be seen that as a competitor with the other miners in the State he is compelled to serve a 3 years' apprenticeship. The union has a warrant in enforcing this rule, growing out of an act of the legislature entitled "An act concerning qualification of miners," approved June 7, 1897. This provides that "every person desiring to work by himself in rooms of coal mines in this

State shall first produce satisfactory evidence to the mine manager of the mine in which he is employed or desirous to be employed, that he has worked at least 2 years with or as a practical miner. Until said applicant has so satisfied the mine manager of the mine in which he seeks such employment of his competency he shall not be allowed to mine coal unless accompanied by some competent coal miner until he becomes duly qualified." Any violation of the act works a forfeiture of the certificate of the manager of the mine where such party is employed.

It is not only in the strict enforcement of the law, but also in the preliminary requirement of 1 year's work as a "top man" that the Miners' Union of Illinois protects itself from immigrants as well as farmers.

Contrast now the operations of a somewhat similar law, applicable to the anthracite coal mines in Pennsylvania, where the union is weak. An act approved July 15, 1897, to protect the lives and limbs of miners, etc., in the anthracite coal mines of Pennsylvania, provides for the establishment in each of the 8 inspection districts of the anthracite coal regions of a board to be styled the miners' examining board. This board consists of 9 miners to be appointed from the most skillful miners actually engaged in the business, who have had 5 years' practical experience in the same. Each examining board registers the names of all persons duly qualified to be employed as a miner. A fee of \$1 is paid to the board, and a fee of 25 cents is charged where the person has been examined by another board. The amount derived from this source is held by the board and applied to the expenses and salaries. The board is required to grant "such persons as may be qualified, certificates of competency or qualification, which shall entitle the holder thereof to be employed as and to do the work of miners, as may be expressed in said certificate, and such certificate shall be good and sufficient evidence of registration and competency under this act. * * * All persons applying for a certificate of competency, or to entitle them to be employed as miners, must produce satisfactory evidence of having had not less than 2 years' experience as a miner or as a mine laborer in the mines of this Commonwealth, and in no case shall an applicant be deemed competent unless he appear in person before the said board and answer intelligently and correctly at least 12 questions in the English language pertaining to the requirements of a practical miner and be perfectly identified, under oath, as a mine laborer by at least 1 practical miner holding miner's certificates."

It is plain that if the Mine Workers' Union of the anthracite section took it upon itself to enforce this law in spirit and in letter, it could not only enforce a period of apprenticeship upon every "unpractical miner" equal to two years, but could absolutely shut out immigrants who have not learned to speak the English language. But the law, contrary to the experience in Illinois, increases the competition of fresh immigrants, since in practice the examining boards make no examination whatever of the applicants. The payment of the fee and the granting of the certificate are a mere formality and very few applicants are refused. The consequence is that the mine manager who employs a certificated miner is relieved of all responsibility for any accident which the miner may have brought upon himself or others. He therefore employs such miners as he sees fit, usually sending them into the more difficult and dangerous places where experienced miners are reluctant to go. Instead of imposing a period of apprenticeship like that in Illinois, the Pennsylvania law, through the weakness or negligence of the miners' union, actually intensifies the competition from the unemployed who may congregate around the mines.

V. WAGE STATISTICS.

The problem of comparing the movement of wages in the mining industry over a period of years is peculiarly difficult, as will appear from the following considerations:

The companies report the average number of employees and the total wages paid, but not the wages paid to individual employees. Prior to the organization of the union in 1897 in the bituminous region, and 1900 in the anthracite region, the system of subcontracting prevailed, and the only person appearing on the company's book was the contracting miner, who usually had 1 helper, and in the anthracite region sometimes as high as 6 helpers, whose names did not appear on the books. Also, prior to organization, there was no rule preventing a miner from digging out coal on days when the mine was not hoisting, but the companies report the number of days worked as equivalent to the number of days when hoisting. In this way the average daily earnings per man appeared larger than they really were.

Again, before the period of organization the miners were not permitted to station their own "checkweighman," in order to verify the measurements, and it is well known that, in course of time, the "boxes," "cars," and "tons" gradually increased in size, so that in the anthracite region ultimately a ton was rated at 3,360 pounds. In this way the real price per ton was continually falling, though not apparently so.

Lastly, the charges for powder and the introduction or discontinuance of company stores introduce variable factors which do not always appear in the earnings. For

these reasons no statistical authority has undertaken to compile a series of miners' wages over a period of years, and the averages compiled by different authorities at intervals are not to be relied upon. The nearest approach to a continuous view of miners' wages is that of Mr. Joseph D. Weeks, in the Aldrich report, who gives the comparative wages of day men in an anthracite mine for the years 1840 to 1891. This reported is submitted herewith.

ANTHRACITE COAL.

Rates of wages paid miners on company work at anthracite coal mines in Luzerne County, Pa.¹

¹ Aldrich report, part 4, 1893, Table XIII, p. 1561.

BITUMINOUS COAL.

Wages paid in mining bituminous coal in first and second pools of the Monongahela River, near Pittsburgh.

The rates given from 1840 to 1857, inclusive, are the rates paid per 100 bushels. It is assumed that the average product of the miner per day, when work is steady, is 100 bushels, which would make the rate given as the price per 100 bushels the daily rate of earnings.¹

Date.	Rate of pay (per bushel).	Date.	Rate of pay (per bushel).	Date.	Rate of pay (per bushel).	Date.	Rate of pay (per bushel).

¹ Aldrich report, part 4, 1893, Table XIII, p. 1565.

² Rate of pay from 1840 to 1857 is per 100 bushels.

Besides the foregoing report of Mr. Weeks, the principal source of information on miners' wages is the reports of the Illinois bureau of labor statistics, continued latterly as the Illinois coal reports. Following is a summary of investigations made by that office in the years 1881, 1882, 1884, 1890, 1896, and 1899. As will be seen, the several investigations are not upon a uniform basis.

The first investigation made by the Illinois bureau of labor statistics was in 1881. This included 95 families of miners, with 109 persons earning wages, the aggregate earnings for 1 year being \$84,563. Average earnings per family were \$363.82. No statement is made of the location of families or their distribution throughout the State.

"The question of wages," says the report (p. 225), "is one of the most mooted which has come before us. During the fall and winter season a good workman can earn, in the majority of mines in the State, from \$50 to \$90 per month. The average earnings, however, hardly exceed \$400 the year round, and taken one year with another will not average that amount for the past 10 years."

In 1882 the Illinois bureau continued its investigation. It reported that the price of mining has advanced about 11 per cent during the year (p. 36). The coal companies own the houses and land occupied by the miners and the stores at which they trade. The status of the miners in this case is low. This condition is passing away. The following table is published on page 319:

TABLE 31.—*Braidwood.*

Number in family.	Earnings of head of family.	Earnings of other members.	Total incomes.
10	\$450	\$480	\$930
2	410	410
5	480	480
3	406	406

"Considering the dangers besetting them and the severity of their labor, it is greatly to be regretted that the income is not sufficient to provide them a greater proportion of the comforts of life. Besides the ordinary dangers that surround them, they are especially liable to loss of time on account of the fluctuating demand for the product of the mines" (p. 320).

The report states: "Perhaps no one body of laborers, taken as a whole, have made as little progress from their condition as mere wage workers as the miners of this State, and it is a question which concerns the whole State, as well as the employers of these men and the people who live in their immediate communities, whether this condition may not be much improved in the near future.

"The majority of our mining population is of foreign birth or parentage, and as a rule the sons of miners follow the employment of their fathers."

The next investigation made by the Illinois bureau was in 1884, wherein 290 families of coal miners were reported upon as part of an investigation of 2,129 families in various occupations. This report was made at a time when the Slavic and Italian elements in the mining population were as yet insignificant. The following table shows the distribution of the 2,129 families by nationality and by occupation. In the coal mines the English played the leading part in the investigation, numbering 76, the American born followed with 63, the Irish with 47, the Scotch with 38, and the Germans with 28. Only 5 Italian miners were investigated and no Poles.

TABLE 32.—Nationalities and their representation in classified occupations in Illinois, 1884.¹

¹ Ill. Bur. Lab. Stat., 1884, p. 180.

In this investigation the striking result is the low earnings of coal-mine employees compared with those of other occupations. The average earnings of all employees, including one foreman at \$1,000, was \$399.73. But coal-mine employees earned the lowest of all classes, only \$370.33. Coal miners proper, numbering 232, earned \$385.43 per year.

Next to coal miners were the "shop trades," earning \$373.99; while the "building trades" earned \$414.15, and railroad employees \$550.

That the wives of coal miners do not find occupation as wage earners to the extent reached in other occupations appears also from the table.

TABLE 33.—Family earnings by occupation—Illinois, 1884.¹

¹ Illinois Bureau Labor Statistics 1884, p. 283.

The same investigation showed that 15 per cent of the blacksmiths do not make a living, and that the same is true of 11 per cent of the bricklayers, 25 per cent of the carpenters, 25 per cent of the cigar makers, 30 per cent of the railroad employees, 37 per cent of the laborers, 25 per cent of the shoemakers, 30 per cent of the teamsters, and 30 per cent of the coal miners. In this respect, however, the coal miners were superior to unskilled workers in general, of whom 35 per cent did not pay expenses.

TABLE 34.—*Earnings by classes of employment—Illinois, 1884.*¹

¹ Illinois Bureau Labor Statistics, 1884, p. 258.

Those who show average earnings of more than \$300 and less than \$400 are representative of 191 individuals, among whom are day laborers, coal miners, railroad section men, hod carriers and others (p. 263).

The Coal Report for 1890 gives record of 5,356 coal miners in 11 different mines, where the average earnings for the year were \$384.14, or \$2.23 per day, working 11 months in the year.

In 1896, in the Annual Report on Coal Statistics, the Illinois bureau made an attempt to arrive at definite knowledge of the actual earnings of the miners. The method adopted was such that the apparent daily earnings of the miners were greater than their real daily earnings. This is because the number of days of actual employment for each man is based upon the reported number of running days of the mine. But many days, when the work is nominally suspended, the miners are setting props and getting in readiness for the resumption of work. These days are not accounted for. This discrepancy, however, affects only the daily average earnings, and not the yearly averages of \$318.65 and \$313.59.

The investigation included wages paid by the ton and wages paid by the day.

TABLE 35.—*Earnings of miners, 1896 (Illinois).*

Average daily income.....	.873	.859

In 1899, for the first time in the Reports of the Illinois Bureau of Coal Statistics (p. XLVI), the operators of mines were asked to furnish the total amount of wages paid all classes of employees excepting office help. The totals are condensed in the following summary:

TABLE 36.—*Earnings of Illinois coal-mine employees, 1899.*¹

District.	Miners.	Day men.	Boys.	Total.	Average number of days worked.	Total wages paid all classes of employees.	Average wages per day, all employees.	Average wages per year, all employees.
First.....	5, 688	1, 385	425	7, 498	188	\$2, 835, 177	\$2.01	\$387.00

Total.....	25, 838	9, 096	1, 277	36, 211	186	14, 616, 555	2.20	406.98

¹ Illinois Coal Report, 1899, p. L.

The foregoing table, it should be noted, is based on the total number of all classes of employees in the mines, including miners, daymen, and boys. Deducting the 1,277 boys, whose daily wages are estimated at 75 cents each, and 9,086 day men, whose average wages are estimated at \$1.90 each, it follows that the average earnings of miners were \$434.39 per year or \$2.55 per day.

Contrasting these different investigations it is apparent that the bases are not uniform. In 1881 the report is based on families and in the other years on miners or mine employees. In 1882 only four miners are reported and their high wages may not have been typical. In 1884 the earnings of 232 miners reported give a wider basis for comparison. There is no doubt that wages declined during the years 1881 to 1886, the decline amounting to 33 per cent, according to a report of the Illinois bureau for 1886 (p. 356). In 1890 the earnings were about the same as in 1884, but they declined to \$318.65 in 1896, a drop of 17.2 per cent in six years. In 1899 they had recovered and reached the highest point in twenty years, \$434.39 (excluding the inadequate report for 1882). The following is a comparative table of the foregoing results:

TABLE 37.—*Comparative earnings of miners and miners' families, Illinois.*¹

Year.	Number.	Designation.	Average yearly earnings.
1881	95	Families..	\$383.82
1882	4	Miners...	438.00
1884	232	do	385.45
1890	5,356	do	\$24.14
1896	16,635	do	\$318.65
1899	25,838	do	\$434.39

¹ Compiled from Reports of Illinois Bureau of Labor Statistics and Coal Reports.

² By ton.

³ By day.

In general it may be stated that there was a sharp decline in the earnings of bituminous coal miners in Illinois prior to the year 1884; that earnings in 1890 were about the same as in 1884; that they declined 17 per cent from 1890 to 1896, and that they increased 36 per cent from 1896 to 1899, to a point probably higher than at any time within the past 20 years. A similar movement of earnings has probably occurred in the 3 other States of the competitive field, namely, Indiana, Ohio, and Pennsylvania, covered by the Mine Workers' Union, but the recent rise has not occurred in West Virginia, where the union has not gained a foothold. The decline of wages in 1882 to 1884 followed an enormous immigration of laborers from Europe, but it was also accompanied by a general depression of business, which reduced the coal product from 82,578,204 tons in 1884 to 72,621,548 tons in 1885. (See Table 28.) On the other hand, the daily rates of wages in the 25 selected occupations reported by the Commissioner of Labor (not including miners) (see p. 307 and chart) actually rose 1.73 per cent during these years, but the yearly earnings doubtless declined.

The decline in coal miners' wages following 1892 resulted from the depression of business coupled with a disorganized labor market, as shown by the fact that in the 25 occupations reported by the Commissioner of Labor (see p. 307 and chart) the decline in wages from 1892 to 1896 was 4 per cent, whereas in the coal trade the decline from 1890 to 1896 was 17 per cent.

The recovery of wages from 1896 to 1899 was owing to returning business activity and increased demand for coal, combined with labor organization. This increase was 36 per cent, whereas the average increase in daily rates of wages in 192 occupations reported by the Commissioner of Labor for the same period was only 3.7 per cent. (See p. 308.)

VI. ACCIDENTS IN RELATION TO THE FOREIGN BORN.

That mining is a dangerous occupation is admitted by everyone, but as to the causes and prevention of accidents opinion is divided. The dangerous character of mining is shown by an examination of the accidents in relation, first, to the number of employees and, secondly, to the number of tons mined. The following table shows the number of fatal accidents per thousand employees and the number of tons mined for each fatal accident. This is given for both the anthracite and bituminous mines of Pennsylvania.

TABLE 38.—*Fatal accidents per 1,000 employees and number of tons mined for each fatal accident.*¹

¹ Accidents: Penna. Bureau of Mines, 1899, pp. IX-X, XIV.² The returns not complete.

It is seen from the table that the number of accidents per thousand employees shows a general decrease in the anthracite mines. But it must be borne in mind that the great majority of these accidents happen inside and that the rate based on the total number of employees does not take into account the large number employed outside. Now, this number working outside has increased out of proportion to the number of inside men, so that the rate for 1898 is not absolutely to be compared with the rate of 1870. This difference is not so marked in the bituminous mines because the proportion of inside and outside men has remained more nearly regular than in the anthracite mines.

Comparing the number of tons mined to each fatal accident it is seen that in the bituminous mines there has been a slight tendency for the number of tons per accident to decrease from 1879 to 1898, which would show that mining in the bituminous mines is becoming more dangerous. On the other hand, the tons mined per each fatal accident in the anthracite mines increased over the number in 1870-1876, since which time the rate has remained steady with the exception of 4 years. This would seem to show that there has been an improvement and a slight decrease in the dangerous character of anthracite mining considering the number of tons mined per fatal accident.

But in general it will be seen from the above table that there has been only a slight change in the number of accidents in these mines even in the face of the rules and regulations enforced by State inspectors. The reason for this rate and its continuance may be found in the character of the mines. The difference in the number of accidents in the anthracite and in the bituminous mines is, to quote from the Pennsylvania Report of the Bureau of Mines, 1897 (p. IX), "in part accounted for by the thickness of the seams, their frequent heavy pitch, the depth of the mines, and their gaseous condition." The older the mines, on the other hand, the more dangerous they are and the continuance of a high rate of accidents may show the increasing difficulty of extracting coal.

A more frequent explanation is to attribute the accidents not only to the natural conditions but to the presence of foreigners. The mixture of several nationalities who do not speak the same language, and understand one another with great difficulty, is a disturbing condition and complicates things in the face of danger where quick thought and promptness of execution are often able to prevent accidents.

Language and mode of thought are not the only danger in the employment of foreigners. Their ignorance, combined often with recklessness, leads them into dangerous places without consciousness of the danger. In connection with their ignorance the foreigners are often driven into the most dangerous places, or they may willingly take the greatest risks in order to show their willingness to work. Aside from this their desire to make good earnings, while they at the same time work cheaply, leads them to neglect many of the ordinary precautions because the time spent on that is to them wasted. It is thus that through ignorance they may enter a dangerous place with a naked lamp, or willfully fail to put up props at the proper time.

The increase in the number of accidents in the bituminous mines followed the increase in the number of foreigners who entered the mines. But the difficulty in attempting to study the effect of immigration on the number of accidents is found in the fact that the Pennsylvania Bureau of Mines does not give the nationality of the miners. But this much can be said, that the number of accidents has not, over a period of years, shown any marked change. So far as there has been a change it has tended more toward an increase. This condition may be the result of increasing difficulties or to the increased number of foreign born. More probably both elements combined would largely explain the condition, though it might reasonably be expected that State regulations and frequent inspections would have some effect in reducing the number of accidents.

In this connection it is of interest to make a comparison between the number of accidents occurring among the miners and the accidents to employees of railways. The report of the inspector of coal mines of Pennsylvania for 1895 makes such a comparison.

In the anthracite mines in 1895 1 miner was killed to 342 employed; in the bituminous region, 1 to 544. Among railway employees of the United States in 1895 there was 1 killed to 432. This is more dangerous than in bituminous mines and less dangerous than in anthracite mines. The nonfatal accidents were greater on the railroads than in the mines.

In considering the nationalities of the injured it is not possible to reduce the accidents to rates on the basis of the nationalities employed. The Pennsylvania reports do not state the nationalities of the miners, but they do give the nationalities of those injured. It is then possible to classify the accidents as fatal and nonfatal and give them for the different nationalities. The following table shows the number of accidents for each nationality in the anthracite and in the bituminous mines in Pennsylvania for 1898, and also shows the per cent of accidents to American born and to total foreign born.

TABLE 39.—*Nationality of miners injured in Pennsylvania in 1898.*¹

Nationality.	Anthracite.				Bituminous.			
	Fatal.	Non-fatal.	Total.	Percent.	Fatal.	Non-fatal.	Total.	Percent.
Americans.....	73	245	318	20.8	51	109	160	26.8
Austrians.....	27	9	36		12	15	27	
English.....	21	75	96		25	30	55

Total.....	431	1,093	1,524	100	199	397	596	100

¹ Pennsylvania Report Bureau of Mines, 1898, pp. LXXX, LXXXII.

The above comparison is inadequate because the percentage of each nationality among the miners is not taken into account. In the Bulletin of the Department of Labor (Vol. II, p. 751), Mr. G. O. Virtue has given the percentage of different nationalities employed in the Pennsylvania and Reading mines in 1896. These mines

make up the greater part of the sixth anthracite district of Pennsylvania. Dr. Virue estimates them at 70 per cent of the district. It is then possible to draw a comparison between the accidents of each nationality in the whole district and the corresponding number of miners in the principal mines of the district. The following table is intended to show the number and percentage of accidents in each nationality for the sixth district, anthracite, in Pennsylvania, and the number and per cent of the same nationalities in the mines of the Philadelphia and Reading Coal and Iron Company:

TABLE 40.—*Sixth district anthracite.*¹

Nationalities.	Accidents.				Percent of these nationalities employed in Philadelphia and Reading mines.	Number.
	Fatal.	Non-fatal.	Total.	Per cent.		
Americans.....	2	4	6	3.6	20.6	5,838
English.....	4	4	8	4.8	6.3	1,799
Irish.....	14	16	30	18.1	21.3	6,025

	67	99	166	100	100	28,360

¹ Bureau of Mines, Penna., 1896, p. 191, Bulletin Dept. of Labor, Vol. II, p. 751.

From the above it will be seen that the American, English, German, and Irish mine employees have considerably smaller percentages of accidents than their numbers bear to the total number of employees. The Scotch have accidents in proportion to their number. It is thus evident that the American-born, English, Irish, and Germans must exercise more care and have greater experience in dealing with dangerous conditions than the more recent immigrants who are represented by the Poles, Hungarians, and Italians. In the case of these latter people and the Welsh the proportion is very much higher than their proportionate numbers, which shows that these people either do the most dangerous work, are inexperienced and ignorant, or careless and reckless. This is especially the case with the Hungarians and Poles, whose willingness to take chances and disregard even of the ordinary dangers are well known. But the case of the Italian is somewhat different. Very few work on the inside of the mines because they are timid and seem anxious to avoid danger, but the number of accidents happening to them is almost twice their proportionate number.

Upon the causes of accidents and the possibility of reducing them to a minimum the remarks of the mine inspectors are of importance. As to the accidents resulting from inexperience, the inspector of the sixth bituminous district of Pennsylvania said:

Of the 13 accidents that resulted from falls of coal and rock, only 4 were really unavoidable, the others having been caused either by carelessness of the unfortunates or incompetency. I found the latter cause to be in the majority, the inexperience of many of them in mining being so limited that they were not aware of the dangerous conditions when they existed and therefore did not protect themselves.

The carelessness of miners and their willfulness in failing to take the most ordinary precautions is brought out in the Report of the Bureau of Mines of Pennsylvania, 1897 (p. IX):

With all the object lessons presented of men maimed and killed, there is evidence where men deliberately, and against all laws and common sense, enter a mine with a naked light when they have been repeatedly told not to do so, and even going so far as to secrete matches or manufacture a key to open their safety lamps in order to get a light for their pipes. They fail to put up props at the proper time, neglect sprags to protect the coal from falling on them, use an iron bar to ram a cartridge back in a hole, and do many other things that they know themselves they should not do, all of which are prohibited by law. These are conditions that are undoubtedly difficult to combat. No occasional inspections or regulations on paper can take the place of intelligent supervision of the mines.

It appears from the reports sent to this office that 609 fatal and 1,623 nonfatal accidents occurred in and about the coal mines of the State during the year 1898. Two hundred and fifty, or 41 per cent, of the fatal accidents were attributable to carelessness or violations of the mine laws by the victims themselves. Of the 1,623 non fatal accidents, 700, or 43 per cent, were attributed to carelessness or violation of the mine laws by the injured.¹

It is probable that the number of accidents depends somewhat upon the enforcement of the mining law. The chief mine inspector of Pennsylvania touched upon this in the report of 1897 (p. 9):

There is no question but if the mine rules, general and special, were more vigorously enforced, the number of accidents would be very materially reduced. Some people attribute the cause of so many accidents to the large foreign element employed in and about the mines. I have my doubts as to that being the cause. My experience and observations have been that this class are as careful of danger, if not more so, than many of the experienced miners.

CHAPTER VI.

MISCELLANEOUS TRADES.

In addition to the extended investigation reported in the foregoing pages concerning the effect of immigration on the clothing workers, cigar makers, and coal miners, the following pages contain the results of less complete inquiries made in other trades where immigration does not at present play so important a part, or where its influence is not so great as in former years. This is followed by a summary of an investigation covering practically all the trades in the State of New York, made in 1898 by the bureau of statistics of labor of that State.

Textile trades.—In the textile trades the most striking feature is the great improvement in machinery and the large number of new inventions and labor-saving devices continually introduced. A brief reference to the silk textiles will be found on page 445. The improvements in both silk and cotton manufacture have been among the most remarkable in recent industrial history. When in England steam power was introduced into cotton manufacture in 1812, a weaver would run two looms, work about 13 hours a day, and earn about \$1.75 per week. In Fall River in 1848-1850 a skilled weaver would run 3 looms and earn \$4 per week. The rate was 25 cents a cut of 36 yards. The length of the cut was gradually increased until in 1870 it was 45 yards and the price per cut was 30 cents. In 1850-1855, 4 looms of 130 picks a minute were tended, then 6 looms in 1860, and in 1872 8 looms of 180 picks. At the present time the loom has from 180 to 225 picks per minute on ordinary prints.

As to production, a weaver can now produce, working 58 hours a week, more work than he formerly could while working 13 hours a day. In 1872 a weaver was able to earn \$12 to \$13 a week, but it is claimed that at present very few weavers are able to earn that amount—the average is from \$8 to \$10 per week—and their work is now much harder. The foreman of a weaving shop in Fall River, Mass., says:

Wages have decreased rather than increased. Not only have they decreased in proportion to the amount of work done, but they have decreased absolutely. A man used actually to earn somewhat more money while producing somewhat less work than he can earn to-day doing double the work.

The Bulletin of the Department of Labor, July, 1900 (p. 783), gives the average daily wages for weavers. In Fall River the average daily wages in 1893 were \$1.30, and in 1900 \$1.37, an increase of 5 per cent.

In considering machinery it is said that skilled help is constantly being replaced by the introduction of new machines. Much less skilled help is now required in the card room and in the spinners' and weavers' rooms. A new machine or a more perfect part of a machine is being introduced almost every day, thus simplifying the mode of production, making it safer and more regular, so that a better thread and a better cloth can be produced at much less cost. For example, improved "ring" spindles are now replacing "mule" spindles. As to the effect on labor as a result of this machine, the testimony of a foreman is important:

In a few months we will throw out all our mule spindles and put in ring spindles. We can manufacture twice as much thread on the ring as on the mule in the same space, and while it is said that the thread is not as good on the ring as it is on the mule—that is, it is a little harder and does not take on print so easily, yet that has not been my experience. The modern ring spindle can produce almost as good thread with the ring as with the mule, the mule taking up twice the amount of space. Another saving on the ring spindle is in the cost of labor. The mule spinner is a mechanic. He works very hard in order to make a living, and it takes him some time to learn the trade. He earns from \$12 to \$14 a week and probably can not do much more work than a woman could do on the ring spindle. Now the woman who tends the ring spinning machine only earns from \$6 to \$8 a week, so there is that saving on her wages. She does not have to work half as hard as the man, and she can learn the business in a week or two.

As a result of such improvements in machinery the producing capacity of the employee has been greatly increased, and the trade has expanded as a result of the increased productivity of labor. Upon this point a foreman said:

Weavers have more than doubled their capacity and output in the last 30 years that I have been in business, without regard to the Northrop loom. With the Northrop loom they are able to produce five times as much as they were able to produce 40 years ago. This is mainly due to improvements which have been made in the looms. Not only the loom, but the spindles, both mule and ring, have

been so perfected that the warp and the filler do not break as often now as they did with the old-fashioned machinery. Also they do not require half as much fixing as they formerly did, while at the same time the weaver works harder now than he used to work and is producing a great deal more. It is also true that it would not have been possible for him to have worked so hard years ago with the machines and the thread in the imperfect state in which they then were. We are now using better machines and better cotton, and the weaver is able to do several times more work than he could do years ago.

The operatives in these textile mills in Fall River and New Bedford are largely English and Irish, with a large number of French-Canadians. With these nationalities there are also Portuguese from the Azores and the Cape Verde Islands.

There are in Fall River about 5,000 people who are eligible to membership in the Card Picker and Ring Spinning Association. Probably 75 per cent of them are women and 25 per cent men. With regard to nationality there are about 30 per cent Irish, 25 per cent English and Scotch, 30 per cent French, 10 per cent Portuguese, and 5 per cent others. In the union about 75 per cent are English, Irish, and Scotch; 20 per cent French; 5 per cent Portuguese, Poles, and others. It is stated by one of the foremen that immigration has come in as "quite a factor" in the industry. He said: "We can get almost all kinds of help; all we want."

It is said that as a rule the French do not join the unions. The attitude and the condition of the French-Canadians has been expressed as follows by an old weaver who worked both in England and in America since 1850, and is now a justice of the peace in Fall River:

The French Canadians came to New England first in 1806. They used to come by carloads. Conditions then were fairly good, but after that the price for labor began to fall. For a time the manufacturers seemed to prefer them to the English and Irish. It is very easy to enter into the textile business. No skill is required in some work in the card room, and in 3 or 4 weeks a person can learn to run 4 looms and begin to earn some money. It used to be impossible to organize the French at all. But now this has changed somewhat and there are some French in the unions. Their standard of living has also improved. They used to come intending to go back to their farms or to earn enough to help for a farm, and this is often the case now. When the price for labor in New England rises they come in large numbers and when the price falls large numbers of them go back, but more of them stay than formerly. When they first come they are willing to work for almost any wages, and their standard of living is low. But in a few years they improve and want to live comfortably and dress as well as the English, and Irish, and Americans. There are quite a number of them who have accumulated property and are well-to-do, and some of them are foremen or shop bosses. The French are a very saving people and are anxious to own their own homes.

The factory inspector of Fall River also says in regard to the French-Canadians:

My impression is that the standard of living of the French-Canadian is much below that of the English, Irish, Scotch, and Americans in the cotton mills. Those that come here were formerly farmers, and usually come with the intention of going back, and they live as best they can while they are here. Farmers in Canada send their families to Fall River and other New England towns to earn some money and then return. They have to live in our towns 5 or 6 years before they become Americanized and raise their standard of living. They come here now in quite large numbers whenever there is a busy time. When work is slack they go back.

The Portuguese are found in largest numbers in New Bedford, where there are about 8,000. These people come from the Azore Islands, and are here employed in fisheries and fruit raising, and also in the mills. There are also about 2,000 from the Cape Verde Islands.

These Portuguese are employed both in Fall River and New Bedford, but the larger number are in New Bedford. The factory inspector reports that they usually work on unskilled parts of the work in the mills at low wages, and that they both dress and live poorly.

In Fall River in the Card Picker and Ring Spinning Association about 5 per cent of the members are Portuguese and Poles. The secretary says that when the Portuguese join the union they stay in it, and the same is true of the Irish and English, but not so true of the French.

Proportionate to their numbers we have much less of them in the union than of other nationalities. There are few Poles in proportion to their numbers. It is very hard to get them into a union when they are green, but after they have been in the country a while they make good members. The same is true of the Portuguese.

In comparing the French and the Portuguese the secretary of the local Card Picker-Room Operatives in New Bedford says:

The French are not good members, except in some trades, such as the mule spinners, where they have been in the country for a long time and have become Americanized. We are not bothered very much by the Portuguese. Those who do join the union stay in it and are good members. I know of cases where men have gone to sea and when they returned after 5 or 6 months they paid all of their dues before going back to the factory. This is not true of other nationalities. While there are a great many Portuguese in this city, there are not many of them in the mills. They only go into the mills during the winter. In the summer they fish. This is true of many of the French-Canadians. They work in the mills in the winter and in the summer return to their farms in Canada. My impression is that the blacks of the Cape Verde Islands are not as industrious as the whites of the Azores.

Wages in cotton mill at Fall River.

Unloading cotton (male).....	per hour..	\$0.20
Yard men:		
Foremen	per day..	1.50
Others	do.....	1.25
Cotton throwers (male).....	do.....	\$0.95 to 1.10

Oilers, scrubbers, and handy men (male)	do.....	5 00 to 6.00

Shoe trade.—There are probably 250,000 employees in the trade in the United States, 100,000 being in Massachusetts. In April, 1895, the present union was organized, and has now about 20,000 members in the United States, 6,125 being in Massachusetts. This shows that less than 8 per cent are organized. As to immigration, it can be said that the effect at the present time is small, owing to the slight influx of foreigners in the trade in recent years. Probably 85 per cent of the workers are native-born. The reduction of wages that has occurred in this trade has been owing to the introduction of machinery and the lack of organization. This lack of organization in turn is largely owing to the mixed nationalities which have entered the trade in past years. Recently the Armenians and Italians have been introduced in limited numbers, and have been used in breaking strikes. In this respect there has been serious disadvantage from immigration. (See volume VII, Reports of Industrial Commission, p. 369.)

Since there has been no organization to control the introduction of machinery and maintain wages, the policy of the union at the present time, based on the union label, consists simply in effecting arbitration agreements whereby it is hoped that steady employment may be secured.

In New York City the number in the shoe trade is about 40,000 men and 1,000 women, but there is no branch of the National Boot and Shoe Workers' Union in New York or Brooklyn. Twelve or 15 years ago there was an organization of the Knights of Labor in the shoe trade, which was changed about 8 years ago into a Socialist Trade Alliance when the Socialists controlled a part of District Assembly 49. The shoemakers' organization has since split; about 150 belong to the Socialist Trades Alliance and about 700 to an independent organization, called the Independent Shoe Workers' Union. About 550 of this number are men, and the remainder women. About 150 of the Jewish shoe fitters are organized, and of these the majority work in contractors' shops. In New York the Jews take out "fitting" from the contractor. The number of these Jews is about 300. This is probably the only remnant of the sweating system in the shoe manufacture now existing in the United States, unless possibly the Chinese shops in San Francisco are of this character. This work is usually done in "inside" factories by girls, but these Jews in New York under this form of sweating do even a better class of work and at less cost than that done by the girls in the inside shops.

In comparing conditions in the United States with those in Russia a Jewish shoe fitter says:

A shop of 10 people in the old country where I worked would turn out about 400 pairs of uppers in a week. Here in America the same number of people, with better machinery and a more minute subdivision of labor, will turn out 1,500 a week. I used to earn 10 rubles (\$4) a week. I now get \$14. I think, on an average, that the shoe fitters in New York get about \$2 per week more than they used to get rubles in the old country.

In the higher grades of work in New York most of the people are German, English, and Irish-American. In the cheaper grades of work Jews, Italians, and Poles come in very largely. In fitting, however, which is usually girls' work, the girls have come in and make first-class hands.

There is another form of manufacture whereby cheaper grades are made in country towns. Here girls are employed, and this practice cuts into the shoe trade

by introducing cheap American labor and making organization among the employees on a national scale almost impossible.

Low wages in the trade, then, are not attributed by the leaders of the national union to immigration, but to the introduction and improvement of machinery, to the lack of organization, and the large number of women and girls employed in the factories of the small country towns.

In Chicago Swedes, Norwegians, Germans, Irish, and English are largely employed in the trade. Here it is held that the chief factors reducing the condition of the trade are immigration, machinery, and the employment of women and boys. The Armenians and Italians, whether members of the union or not, are looked upon as a bad factor in the trade, because it is claimed that they are not to be relied upon.

The influence of machinery comes from the large number of new inventions, introducing minute subdivision of labor, disturbing old forms of the trade, and producing new kinds of skill. It follows, then, that old forms of organization are giving place to new ones as a result of new machinery, so that, in fact, new trades are being produced. All these changes and disturbances require readjustment in the character of the occupations, in the employment of different kinds of labor, and in the prices paid. These conditions, combined with mixed nationalities, seriously interfere with organization.

Wood workers.—This occupation is divided into three groups, that of building material, cabinet, and furniture. The first two are well organized. The third is not organized, because mainly in small centers and controlled by immigrants. The president of the International Union states that there has been no complaint from locals on the score of immigration for the past 10 years. The immigration from Canada is not serious, since wages are equal to those in the United States. There are 15 local unions in the Provinces.

Regarding the different divisions of the trade, 50 per cent of the cabinetmakers in the United States are Germans. They are considered the best men in the trade. Twenty-five per cent are foreigners of all other nationalities and 25 per cent are native-born. The machinists and wood workers are mostly foreigners. The finishers are 45 per cent foreigners. The large furniture cities of the country are Chicago, Grand Rapids, Jamestown, and Rockford, Ill. The Swedes colonized in Rockford a few years ago and contributed to the reduction of wages which took place. The same is true of the Hollanders in Grand Rapids. The Germans in the Northwest work for very low wages, especially in Oshkosh, where within the past 3 years men were getting as low as 50 cents per day and women were doing carpenter work at the bench. Boys and girls were doing glazing and operating light machines. It is comparatively easy to organize the Germans, more difficult to organize the Swedes, but they make splendid unionists. The Bohemians are considered good "stickers." A large part of the wood workers of Chicago are Bohemians, Swedes, Germans, and Poles. The industry has a fairly good organization in factories connected with the building trades, where they have been supported by the latter in their refusal to construct buildings with nonunion material. Since the building trades' strike of 1900, however, their hours of labor have been increased from 8 to 9, owing to the loss of this support. They control 60 per cent of the sash and door employees, 95 per cent of the office, store, and saloon fixtures, only one desk factory, and do not control the regular furniture factories, manufacturing chairs, tables, beds, and folding beds, nor any of the school furniture "trust" shops. Of the 20,276 people in the trade in Chicago the following are organized, perhaps 4,000 in all. The table shows that in the case of Germans and Bohemians organization has been based on line of nationality.

Union number.	Year organized.	Members.	Nationality.	Occupation.
1	1876-1890	400	German.....	Cabinetmakers.
4	1890	300	Bohemian.....	Machine hands, finishers and carvers.
7	1890	650	English speaking.....	Mixed employment.
17	1890	750do.....	Do.
30	1892	250	Bohemian.....	Do.
67	1896	400	English speaking (mostly Germans).	Do.
75	1895	50	English speaking.....	Mixed employments (South Chicago).
78	1894	300	Bohemian.....	Mixed employments.
85	1897	300	English speaking.....	Mixed employments (Oakpark).

¹ Reorganized.

The effect of machinery with the opportunities it offers for introducing the work of unskilled immigrants, women, and boys is quite marked in this trade. In the furniture factories which are not organized, out of 75 men perhaps only 5 are skilled mechanics. The rest are only feeders. A large number of children are employed and common labor is done almost wholly by immigrants.

In the box-making trade Bohemians, Germans, and Poles predominate. In the union shops 90 per cent of the labor is skilled and in nonunion shops 90 per cent is unskilled, indicating the success of the union in organizing the skilled mechanics and the difficulty in organizing the machine shops with their large proportion of immigrants, women, and boys. The following table shows the wages in union and nonunion shops in the box-making trade:

Relative wages in box-making shops, Chicago.

	Union wages.	Nonunion wages.
	<i>Per dozen.</i>	<i>Per dozen.</i>
Rip sawyer.....	\$2.50	\$1.75
Hand nailer.....	2.50	1.25 to 1.50
Machine nailer.....	2.50	1.00
Bottom nailer.....	2.00	1 3.00
Crosscut sawyer.....	2'00	2 1.00 to 1.25
<hr/>		
	¹ Per week	² Per dozen.

In the piano and organ manufacture, 4,500 persons are employed in Chicago, of which number about 2,200 are organized. The nationalities and numbers in the unions are as follows:

Germans.....	800
Irish, English, and Scotch.....	500
Americans.....	500
Swedes.....	200
Poles and Bohemians.....	200

Nationalities outside of the union are mostly Swedes and Poles. The effect of immigration is found most in the nonunion shops. There has been but little effect in union shops. But there is great difficulty in bringing nonunion shops into the organization. Wages some 20 years ago ranged from \$25 to \$40 per week, but now the rate is \$10 to \$18 for mechanics, and \$6 to \$9 for common labor. Causes for this lowering of wages are immigration, machinery, and employment of women and children. The children are mostly of Polish descent, and the women are of different nationalities. A number of the factories are located in the near-by towns, where Italian immigrants are employed in competition with the labor of the cities. But there seems to be little difference in the cost of living compared with that of the city.

Iron, steel, and machinery trades.—A number of highly skilled trades which have to do with the manufacture and operation of machinery are not much affected by immigration and still less by women and children. In these trades the immigrants who come in are usually German, English, or Scandinavians and have followed the same occupation in their native lands, where they have been faithful members of labor organizations. These occupations are included under the iron and steel industry or are closely allied with it.

The immigrant engineers, iron and steel workers, blacksmiths, machinists, and molders are mostly from Great Britain or Germany. In these countries they have learned their trades and have been members of labor organizations, and when they come here they bring their ideas of organization with them, and their cards of membership, and do not enter into strong competition with those already here. They enter the unions, especially the English and Swedes.

The blacksmiths are not affected by immigration because of the degree of skill required and the long term of apprenticeship necessary before becoming a skilled mechanic.

The men in this occupation are largely Irish and German, and the newer immigrants who may wish to enter the trade must serve a long period of apprenticeship, by which time they have become Americanized.

Besides the distinctly high character of intelligence and skill among the employees in these occupations and the foreigners who come in, there have been restrictions both by statute and in some cases by union rules requiring citizenship of members and of applicants for license. Labor-union members reported to the New York bureau of labor statistics (1898, p. 1070) as follows:

National Association of Stationary Engineers No. 44: "We do not admit anybody unless he is a citizen of the United States." German-American Engineering Association No. 29: "The trade has not been affected by immigrants since the passage of the law of 1897 requiring an engineer to be a citizen before granting him a license."

Machinists.—The officers of the machinists' organization explain that owing to the difference in methods, machinery, and speed of work in the United States, there is but little danger in the competition of foreign immigrants. Although the wages in the trade are much higher than in Great Britain or Europe, yet the quantity of production is still greater, so that the pay of workmen in proportion to output is less than in Europe. There is a complete assimilation between the machinists who come from the British Isles and from Sweden with the American organization, since such immigrants have had the experience of the strong organizations of those countries. From other countries the only threatening immigration is that of the all-around handy man who can be rapidly trained to American methods. But in recent years there has been no effect whatever on the results of strikes which can be ascribed to immigration, although it is believed that employers have indirectly made efforts to secure immigrants. Especially in the last few years have the wages and employment in Europe been so high in this trade that there has been but little immigration.

Amalgamated Association of Iron and Tin Workers.—This organization ascribes its defeat at Homestead to the importation of aliens, and since that disastrous defeat wages in the steel mills have been materially reduced. This includes the production of rails, slabs, sheet tin, steel billets, and structural-iron material. It is the only branch of the trade where the scale of wages has not recovered since the return of industrial prosperity. In other cases the union has been able to protect members. An essential factor in the inroads of immigrants was the introduction of machinery which displaced the need of highly skilled work. Unskilled foreign laborers who have been thus introduced are Poles, Hungarians, and Slavs, and a few Italians. The skilled labor is as yet done by natives, but the common labor is done by immigrants. Very few of this lower order of immigrants ever learn the skilled work, but in the second generation they aspire to the skilled jobs. (See Schaffer, Reports Industrial Commission, vol. 7, p. 393.) There is no difficulty whatever with the English, Irish, French, or German workmen in the matter of organization, but in the last 2 years there has been immigration of 40 or 50 Belgians who, it is believed by the leaders of the union, were brought in under contract. Three of these were deported by the authorities at Ellis Island, but satisfactory evidence could not be secured against the others.

The effect of immigration in the last 7 or 8 years has not consisted in breaking strikes, but in the gradual introduction of foreigners through machinery, as above stated. There is, however, another feature of the trade which has been materially affected, namely, the speed of work. It is stated by the president of the association that foreigners, especially those who hope to return to their own country, have no consideration for themselves or their fellow-workmen, but press their output to the extent of their ability. This is shown by the increase in the output of 30-gauge standard sheet, where, prior to 1895, the output for 8 hours, as agreed upon with the manufacturers, ranged from 2,600 to 2,900 pounds. In 1895 it was increased to 5,250 and then to 5,750 pounds by agreement. Individual foreigners, contrary to this agreement, made as high as 7,500 pounds in 8 hours, about double what they made in 1893 and 1894. When expostulated with they did not hesitate to say, "It don't matter. We are going to make our pile while we are here and then we'll go back to the old country again." (Reports Industrial Commission, vol. 7, p. 393.) In this respect it should be noticed that the speed of the American manufacturer is not so great as to keep out foreigners. In the tin mills the competition has accompanied transference of the trade from Wales to this country, and it has consisted of Welshmen, but these men are highly skilled and their organization is the strongest in the association.

Glass workers—Flint-glass workers.—The union in this trade includes about 85 per cent of the workers, and numbers 10,000 members. Being a highly skilled trade, it is not troubled by the immigration of unskilled laborers. Those who come to this country are mainly from Norway, Sweden, and Alsace-Lorraine, where they have learned their trade. There are two considerations which restrict the entrance of immigrants. First, the initiation fee imposed by the union. This fee was formerly \$100 for foreigners, and \$3 for Americans. The fee has been reduced to \$50 for foreigners, the American fee remaining at \$3. There is an opinion in the union that this extreme discrimination against foreigners is not advantageous, as it compels them to enter nonunion shops instead of joining the union. This is known to have been the fact in at least one large nonunion establishment manned mainly by foreigners. The second obstacle to the entrance of immigrants is found in the high speed of the American workmen. On this point, however, there is not uniformity. The union covers a large number of highly specialized occupations, and formerly made as many as 14 different agreements with as many associations of employers for the several specialized departments. In the majority of these departments the quantity of output per day for each workman is strictly limited by agreement, but in six departments the "unlimited" system has been introduced at different times. The unlimited system is specially noteworthy in the prescription department, which numbers about 2,100 members, none of whom are foreigners. The skill in this

department is of a very high degree, and the speed is so great that immigrants can not attain it. The workmen earn from \$6 to \$8 per day, paid by the piece, working in teams of 3 members to the team, 2 men blowing and 1 finishing, and the team turns out 55 gross of one-half ounce bottles per day. There is but one non-union establishment in this country in this department of work.

In another department, namely, the paste-mold department, the competition of foreigners has forced the union to abandon the limited for the unlimited system. This, however, applies only to the thin-ware branch of the work. From 1884 to 1890 immigrants entered this line of work, especially at Cumberland, Md., where they worked by the piece at about 35 per cent less than the union scale. The union shops could not compete and finally, in 1892, the union changed to the unlimited system. The increased production of the system amounted to 100 per cent, and the earnings to about 15 per cent, so that the workmen received about \$4 per day, compared with \$3.50 under the limited system. When, in 1899, the National Glass Company was organized, including both the union and nonunion factories, the union refused to sign the scale until the entire system was unionized. This resulted in raising the wages of nonunion places about 35 per cent, so that men who had been receiving from \$17 to \$19 per week were raised to from \$30 to \$32. Owing to the fact that many of these factories have foreign foremen, it is found that immigrants are still favored in the paste-mold department, where it is easier for them to enter than in other departments.

The introduction of machinery in certain cases has caused both the reduction of wages and an enormous increase in output, especially in the department of machine-made fruit jars. Formerly 3 men made 275 quart jars per day by hand, and now 2 men make 3,400 by machine. The 3 men working by hand were blowers, making \$7.50 per day, whereas the 2 men working by machine are a presser at \$5 per day, and a gatherer at \$2.75 per day.

In this case it is not alleged that immigration effected a reduction in the pay. In the pressed ware department, since 1897, there has existed the unlimited system, and whereas on common tumblers and jellies formerly 800 or 900 per day was the output at \$4, the present output is 1,200 on a sliding scale at 15 cents minimum, the wages remaining about the same.

Glass-bottle blowers.—The organization of the glass-bottle blowers includes about 4,500 men and has almost complete control of the trade. Of this number about 600 are foreign born. These were employed mainly in the nonunion factories in New Jersey, which the union succeeded in capturing in the protracted struggle of 1899-1900. The union has a clause in the by-laws of the national organization providing that no foreign blower be admitted into the association during the blast of 1900-1901, but the president and the executive board have power to authorize any branch to admit such workmen if it was thought necessary. The constitution provides that any member who encourages or assists any foreign glass blower to come to this country shall be fined \$100 and be suspended for one year. (See Report of Industrial Commission, vol. 17, p. 173.)

Formerly the initiation fee for foreigners was \$100, but owing to the stimulus to "scabbing" on account of this discrimination, it has been equalized with the American fee.

The building trades.—In the large cities very few of the workers in the building trades are of the old American stock, but almost entirely they are older immigrants, such as Germans and Irish. These trades are for the most part well organized and, with the exception of carpenters, are not at the present time materially affected by immigration. The bricklayers and masons even claimed that they are benefited. The representatives of that union in New York reported to the bureau of labor statistics, 1898 (p. 1041), as follows: "Immigration benefits our trade. Increased immigration necessitates the erection of more dwelling houses, which means work and prosperity for all the building trades."

Wages at the present time are good throughout the large cities, where it must be borne in mind the men employed in the building trades have themselves been immigrants. In the smaller cities, where the wages are much less than in the larger cities, it is the older American labor which controls the field. In these large cities not only have the wages been increased, but the hours have been reduced from 12 to 10 and again from 10 to 8. In the Bulletin of the Department of Labor, September, 1898, the investigation of wages shows that from 1870 to 1898 the average wages for bricklayers were raised from \$3.15½ per day to \$3.51½; carpenters, \$2.36½ to \$2.52½; hod carriers, \$1.75½ to \$2.005; masons, \$2.80½ to \$3.20½; painters, \$2.22½ to \$2.60; plumbers, \$2.74½ to \$3.15½. (See table, p. 000.) This increase will appear the more important when it is remembered that the number of hours has been decreased and that the rates since 1898, when that report was made, have risen still further. Wages in Chicago for carpenters were raised in 1897 from 37½ cents per hour to 42½ cents.

The effect of immigration on the different building trades varies considerably, carpenters suffering more than others. They are met mainly by the immigration of Canadian carpenters, who affect wages at Boston, Buffalo, Detroit, and the smaller Canadian-border towns. This immigration is described in the chapter on Canadian immigration. (See p. 000.) It should be noted, however, that immigration from Canada to these cities is of the same nature as immigration from country districts in our own country to the cities. This is brought out by the situation in Chicago, where it is noted that the principal danger to the carpenters is from suburban and country towns, which send carpenters to the city in the winter. Very few Canadians come to Chicago. It is stated that not over 50 to 75 carpenters are aliens. The work in the cities is so different from that in a country district and in foreign countries that an outsider can not successfully compete except after learning practically a new trade. Furthermore, carpenters in England, whence the large numbers have hitherto come, are at the present time receiving good wages and are not migrating.

In Chicago the building trades unions are organized largely by nationalities. The reasons seem to be that there is difficulty in getting new immigrants into the union, especially when the union is mixed or is controlled by a leading nationality. It has been found by experience that unions which were exceedingly heterogeneous failed to hold together when really tested. In the matter of getting the newcomers into the union, the case is well illustrated by the Swedish carpenters who, when they first came, could not be induced to enter a union whose membership was larger than that of their own nationality. Since they have been organized in a union of their own, they have been very strong unionists. The following is a list of the organization of the carpenters unions in Chicago by nationalities:

Unions of carpenters in Chicago.

Number of union.	Year of organization.	Members.	Nationality.
1.....	1881	900	Mixed.
10.....	1881	1,100	Do.
13.....	1874-1878	250	Do.
21.....	1881	100	French.
54.....	1886	125	Bohemian
58.....	1891	500	Mixed.
62.....	1881	550	Mostly Swedes.
70.....	1881	50	French.
80.....	1888	150	Mostly Canadians.
181.....	1881	600	Scandinavians.
199.....	1881	225	Mixed.
242.....	1881	80	German.
416.....	1888	250	Mixed.
419.....	1888	200	German.
434.....	1889	50	French.
504.....	1900	100	Jews.
521.....	1881	125	Mixed, Germans

Hod carriers of Chicago have a similar practice. Their union was first organized in 1886 as a mixed assembly of all nationalities. It broke down on this account. The different nationalities then organized separate independent unions, and in 1896 these effected a federation in the hod carriers' council, a delegate body of 4 locals, as follows: No. 1, German speaking, including a small number of colored men; No. 2, Bohemian; No. 3, Polish; No. 4, English speaking, including Italians, Swedes, and about 250 or 300 colored. The colored members are treated the same as others. These are not strictly locals; they are rather branches, since membership is not localized. The leading locals have business agents and the recruits join the local of the business agent regardless of his nationality. Prior to 1896 and the organization of the hod carriers' council, foreign labor coming in in large numbers depressed wages, but since then the scale has been raised.

Granite cutters.—The granite cutters are strongly organized, as a rule, but have made complaint in New York City of the violation of the State law regarding the prevailing rates of wages by the padroni in the case of Italians. The scale is \$4, but it is claimed that these Italians are required to pay the padroni a dollar a day commission, which goes to the contractor. (See p. 435.) The granite cutters in the cities especially complain of work done at the quarries, where mainly immigrant labor is employed and the wages are very low. These quarry laborers are not organized. This is especially true of granite quarries in New England. As far as city employment is concerned, the effect is not serious.

Stonecutters.—The stonecutters have complained in times past of the so-called "harvesters," who come from abroad, work during the busy season, and then return home. The union, however, has been able to stop this practice by requiring an initiation fee of \$50 for foreign stonecutters, the fee for American being \$10. (See Reports of Industrial Commission, Vol. VII, p. 745.)

Bricklayers.—This is perhaps the strongest organization in the building trades, and it has been successful in protecting itself against immigrants. The New York local has a clause in its constitution making it compulsory for persons desiring to become members to be citizens of the United States. This is directed against the so-called "birds of passage" who come from Great Britain in the spring and return in the fall. One device adopted a few years ago to check this class of competition was a provision that the monthly dues in the union should no longer be paid in advance but must be paid each month, the penalty being that the lapse requires a new initiation fee. Considering that a member must attend the monthly meeting of the union in order to pay dues, it will be seen that this provision compels permanent residence in the locality in order to retain membership and find work.

Plumbers.—This organization receives competition from immigrants only from those who come from England and Scotland, but such immigrants have strong unions in their own country and readily abide by the union rules when they migrate.

Longshoremen.—The organization of longshoremen presents one of the most striking instances of the way in which organization overcomes the disadvantages of race competition. Formerly, under the old stevedore system, which was a system of subcontracting or sweating, the men received very low pay at very irregular work. Since 1897, when the national union was organized, their yearly wages have doubled and they have become their own contractors. (See Vol. IX, p. 309.) In a majority of the ports along the Great Lakes, where the union has its strength, the organization is mixed, but at Ashtabula the men are organized by races, namely, Swedes, Italians, Finns, Slavonians, and Portuguese. Each of these races has its own branch or local, and there is a central council composed of the delegates of each which conducts business in English and has jurisdiction over the several locals. At Newport News, since 1899, a similar arrangement has been made between the white and colored races.

In loading and unloading vessels these different races work in cooperative gangs of their own kindred. The contracts with the dock managers are made by the national union at a fixed price per ton for each port. The several gangs take turns on the vessels as they come in, so that the work is distributed equally in the course of the season. Each gang elects its own foreman, whose pay is the same as that of the other members, and the lump sum received for unloading or loading vessels is paid to these foremen and by him equally divided among the members of the gang. It is by this arrangement, based on the national conference with the dock managers, that these diverse nationalities have been able to come together and secure a most important increase in their earnings.

Bakers.—In the large bakeries mechanics are not required because of the introduction of machinery. In these bakeries women and children tend the machinery. With a mixer, a man or boy can do the work of 6 men. With a dough-brake machine, a man can do the work of from 6 to 7 men. With a bread molder, 1 man can do the work of 8 to 10 men. Besides these improvements there are machines for making cakes and crackers, and improved ovens, so that a man's labor to-day produces very much more than it did 20 years ago.

The so-called "trust bakeries," such as the American Biscuit Company and the National Biscuit Company, are not organized, and the union officers say that whenever they had a strike they were replaced by unskilled and immigrant labor and lost the strike.

Investigation made by the New York bureau of labor statistics.—The fact that the city and State of New York are affected directly by European immigration more than other States gives especial interest to the investigation made in 1898 by the bureau of labor statistics upon the effects of immigration upon wages and employment. Following is the summary of the inquiry made by the statistician.¹ Since this investigation was made at a time (1898) when industrial depression had been severe for 3 or 4 years, it naturally shows the serious effects of immigration at their worst.

In view of recurring complaints from labor organizations as to the adverse effects of immigration on the trades in this State, this bureau determined early in the current year to ascertain the facts from those directly affected—the working people themselves, through their unions or accredited representatives; so toward the close of the first quarter there was sent to every labor organization in the State a schedule containing these questions: (1) "Has your trade been affected by immigration during the past 6 years?" (2) "If so, how many of your members have been displaced by immigrants?" (3) "Have wages in your trade been reduced by reason of competition of immigrants?" Responses immediately came from 1,039 organizations, having a membership of 175,958. Negative answers to the queries were received from 774 unions (74.5 per cent of the whole number that returned replies),

¹ Bureau of Labor Statistics of New York, 1898, pp. 1036-1040.

with 105,889 members (60.2 per cent of the total); while 265 organizations (25.5 per cent), returning a membership of 70,070 (30.8 per cent), report that they were directly and detrimentally affected by immigrant labor. This competition was felt by the workers in 85 trades, or 45 per cent of the 189 covered by the research, and its influence was observed to some extent in every general industry except that of glassworking. The building, clothing, coach-driving and livery, food-producing, hat, cap, and fur, iron and steel, leather, marine, stone, tobacco, and wood-working industries suffered the most; but the effect was hardly perceptible in the printing and steam railroad industries.

The returns show that the unions located in towns at or near the seaboard and those bordering on or easy of access from the Canadian boundary experienced a more adverse effect than did those farther in the interior of the State. In all the boroughs of New York City 181 organizations, comprising 68.3 per cent of the 265 imparting affirmative replies, report that immigration affected the employments of their members. Nineteen Buffalo unions answer in the same strain; so do 9 in Syracuse, 6 each in Rochester and Yonkers, 5 in Watertown, 4 each in Albany, Kingston, Lockport, and Troy, 3 each in Newburg and Poughkeepsie, 2 in Utica, 1 each in Auburn, Cohoes, Ithaca, Jamestown, Mount Vernon, Niagara Falls, and Rome, 2 in the village of New Rochelle, and 1 each in Glens Falls, Hurlburton, Mamaronock, Port Chester, Sidney, and Tarrytown.

It is reported by 154 unions that in 6 years 17,322 members were displaced by immigrants; and 97 organizations, having a membership of 22,318, declare that the term of employment of these members was materially lessened, with a resultant decrease in wage earnings, by the surplusage of labor brought about by newly arrived aliens overcrowding the trades. A few unions, although reporting that their members had been affected, fail to show to what extent.

Of the 265 organizations affected by immigration, 120, with 34,304 members, state that wage rates were reduced as a result of the unequal competition of these newcomers, while 137, having a membership of 34,482, report that immigration has not caused reductions in union rates of wages. Eight unions, membership 1,284, do not make answer to the question.

In the building industry 113 organizations, membership 27,862, engaged in 17 out of 26 trades, report an injurious effect. Seventy-four unions say that 9,815 members were displaced by immigrants; 34 organizations, membership 6,832, record an abridgment of employment, with a consequent reduction of earnings, and 33 unions, 4,760 members, show decreases in wage rates owing to immigrant competition. The workers most affected were bricklayers, building laborers, carpenters, painters, and stone masons.

In the tobacco industry 7 unions of cigar makers, numbering 1,504 members, report a detrimental effect; 3 note the displacement of 112 members. 4 organizations, membership 1,185, state that overplus immigration has caused lack of employment and reduction of earnings, and 4 others, with 1,372 members, report reduced wage rates. One union composed of 30 cigar packers states that 2 members were displaced, and that the others had their employment and earnings lessened.

Thirteen of the 18 clothing trades were affected; 31 unions, with 18,631 members, reporting the extent. Twenty-two state that 3,569 members were displaced; 8, with a membership of 5,061, found less opportunity for employment and suffered a decrease in wage earnings, while 25, having 17,020 members, report reductions in rates of pay.

Three unions of coach drivers and livery-stable men report the displacement of 238 members.

Bakers predominate in the food-producing trades that were affected. Nine bakers' unions, with a membership of 571, report the effect. Four organizations state that 48 members were displaced. Eight unions, 393 members, say that on account of immigration the number of days of employment was lessened and wage earnings fell off. Three unions, having a membership of 140, report wage-rate reductions. A union of butchers states that 24 members were displaced.

In the furniture industry an upholsterers' organization, with a membership of 238, makes return that immigration has decreased the number of days of employment, wage rates, and earnings.

Seven organizations, with 1,359 members, in the hat, cap, and fur industry were affected. Four of these unions state that 173 members were displaced; 100 members in another organization had their employment lessened, and 5 unions, with a membership of 966, report reductions in rates of wages.

Of the 5 organizations, membership 782, of hotel, park, and restaurant employees affected, 1 states that 30 members were displaced; 4 report that 632 members could not obtain steady employment, while 4, with a membership of 717, declare that wage rates were reduced.

Immigrant labor affected all but 3 of the 16 trades in the iron and steel industry, according to the returns from 35 unions, having 4,612 members. Sixteen organizations state that 347 members lost their places owing to immigration; 9 unions, membership 871, report a curtailment of employment and loss in earnings, while 20 organizations, with 2,373 members, say that rates of pay were reduced. The workers most affected were blacksmiths and their helpers, stationary engineers, iron molders, and machinists.

Among the leather workers 7 organizations, membership 1,367, felt the effect of immigration. Five of these unions report that 173 members were displaced, while 1 states that the employment of its 275 members was curtailed, with a consequent decrease in earnings, and 4 others, with 637 members, show reductions in wage rates.

The only workers affected in the malt-liquor industry were 28 maltsters in 1 organization. They were displaced by immigrants.

Four organizations in the marine trades state that, owing to immigrants overcrowding the several occupations, their 1,502 members had their working time and wage earnings reduced, and 1 union reports the displacement of 90 members.

In the metal-working industry 2 organizations, with 210 members, report less employment and reductions in earnings as well as rates by reason of immigration.

Six unions composed of 551 musicians were affected by immigration. One states that 25 members were displaced; 5, with a membership of 382, report that opportunities for employment were lessened, and 4, having 472 members, declare that wage rates were reduced.

The effect was slight in the printing industry. One union of book-cover stampers and gold layers reports that 2 members were displaced. An organization of 120 lithographic artists and engravers states that the employment of members was lessened and that wage rates were reduced. A union of 43 compositors replies that there was a reduction in working time and earnings.

One organization, containing 135 locomotive engineers, states that employment was lessened and wage earnings reduced. Two unions of locomotive firemen, with 88 members, report reductions in wage rates, and 1 lodge in the same calling says 20 of its members were displaced by immigrants.

A district assembly of 4,335 street surface railroad employees replies that immigrant competition caused a decrease in wage rates. The same organization reports the displacement of 1,450 members.

Three of the 11 trades in the stonecutting industry were affected, 7 unions, with 784 members, stating to what extent. Three report the displacement of 106 members, and the other 4, membership 546, show that the opportunities for employment were diminished, resulting in decreased earnings. Three organizations, 216 members, report reduced wage rates by reason of immigrant competition.

Four assemblies of 302 pavers and rammer men were affected by immigration, 1 having had 3 members displaced, and the 238 members in the other 3 unions had their employment lessened.

In the textile trades 1 union was affected. It is composed of 22 lace workers, whose wage rates were reduced. This organization also reports the displacement of 20 members.

A union of 2,700 actors states that at times these members were deprived of employment owing to the immigration of people in that profession. The same organization reports that 300 of its members were displaced.

In the woodworking industry 3 unions of coopers report that 515 members were displaced by immigrants. Two organizations, with 400 members, state that the chances of employment were decreased and wage earnings were reduced. Two unions, 189 members, show reductions in rates of wages. A union of 150 kindling-wood workers reports a reduction in wage rates and the displacement of 20 members.

Among the miscellaneous trades are 4 unions of 341 barbers, who report an adverse effect from immigration. Two of these organizations state that 85 men were displaced, and in another 150 members were compelled to work on short time. Two unions, membership 196, say that wage rates were reduced. A union of clerks and salesmen reports the displacement of 100 members, and the same organization also declares that its members had to submit to a reduction in rates of wages. One union of 54 workers in mixed trades suffered a decrease in wage rates, and 26 members were displaced.

CHAPTER VII.

THE PADRONE SYSTEM AND COMMON LABOR.

I. HISTORY OF PADRONE SYSTEM.

In the period of industrial recovery following the civil war there was a pressing demand for labor. Special legislation was even invoked to aid in supplying this demand. Thus the act of 1864, for the encouragement of immigration, gave manufacturers and contractors the right to import foreign laborers under contract. Speculation in cheap labor ensued; agents were sent to foreign countries in search for workmen. The unenlightened peasants of Italy were the easiest victims of this speculation. Their coming, in fact, was not of their own accord, as was the case with the people of northern Europe, but they came usually under contract.

This difference between the Italian immigrant and the northern people, and the reason for their having been so easily exploited, is brought out by their illiteracy and ignorance of the English language.

The great bulk of Italian immigration has come from southern Italy, the provinces, Abruzzi, Avelino, Basilicata, Sicily, Calabria, and Naples. Almost the whole number from these provinces are of the peasant class, accustomed to hard work and meager fare. Their illiteracy is very high. In 1899 the illiteracy for all races of immigrants was 22.9 per cent, while for the immigrants from southern Italy it was 57.3 per cent and for northern Italy the illiteracy was only 11.4 per cent, showing clearly the contrast between this ignorant peasant class of unskilled laborers and the skilled workmen from the manufacturing centers of northern Italy. In 1900 the percentage of illiteracy for these immigrants was 54.5 in contrast to 24.2 for all races and 11.8 for the northern Italians.

This illiteracy is brought out by the investigation of the United States Department of Labor of the Italians in Chicago (9th Special Report, p. 383). Out of 4,553 persons 10 years of age and over, 2,752, or 60.44 per cent, were found to be illiterates. Among 2,812 males 51.96 per cent were illiterate, and of 1,741 females 1,291, or 74.15 per cent were illiterate. As to the literacy itself of the 39.56 per cent who were literate, only 18.21 per cent could read and write English and Italian, while 54.80 per cent could read and write Italian only. More than this, the literate males who could read and write Italian only were 60.55 per cent of the literates, which shows how very unfavorably the Italians are situated when they enter industrial activities under American conditions.

The same investigation showed that of the number of persons of foreign birth and 10 years of age and over, 58.62 per cent were able to speak English and 47.38 per cent were not able to speak English. The following table is taken from the above report (p. 33), and shows the percentage of foreign born 10 years of age and over able and not able to speak English, by the number of years in the United States:

Some form of contract was then necessary to induce these people to leave their country, for by temperament they were not the self-reliant people of the north who came of their own volition. The dread of change, the fear of coming to a strange and unknown land, had to be counteracted by material inducements. It was thus that they came not in search of work, but under contract for several years, and thus were assured in advance of permanent work at what seemed to them high wages.

At this earliest stage in the Italian immigration the padrone was the agent of the contractor or manufacturer. Laborers were demanded, and he acted simply as the agent in supplying specific demands. The manufacturer or contractor was of another nationality, but in looking for cheap labor he had recourse to an Italian already in this country. This Italian, undertaking to supply the number of laborers called for, went or sent to Italy for the number, who entered upon a contract binding themselves to service for from 1 to 3 years, and in rare instances even for 7 years. At the same time he furnished transportation and took care of them upon landing here until they were sent to the work for which they were contracted. It was thus that the padrone was merely a middleman, the man who stood between the contractor and the men. He was looked upon by the men as their representative, not as their employer, and upon him they depended.

Under this early system there were numerous ways in which the padrone could make money. In the first place, he had a commission from the men as well as from the contractor for furnishing the men, and commission on their passage. Upon getting them here he had a profit from boarding them until they went to work. This was deducted from their prospective earnings. After that the padrone usually furnished food and shelter for them while at work. This privilege was usually given free by the contractor who furnished shelter and for which the padrone charged rent. Then there was also the commission from sending money back to Italy, and finally the commission on the return passage after the contract had been completed.

But the padrone par excellence was not an agent and did not act for the contractor. He acted primarily upon his own initiative and for himself. Instead of waiting for a call for men, he would upon his own responsibility engage Italians to come, and contract for their labor for a certain number of years. After having

brought them here he would farm them out to anyone who wanted them. He boarded them, received their wages, and paid them what he saw fit. Sometimes a laborer would receive \$40 a year and as often only \$40 for 2 years. Under this system the padrone occasionally would buy outright a minor from his or her parents. Men, women, and children were thus brought into the country, the boys to become bootblacks, newsboys, or strolling musicians. In this stage the padrone system most closely resembled the system as it existed in Italy, which meant in general the employment of children, or minors, in the "roving professions," such as strolling musicians, performers on the harp or hand organ, and street acrobats. These persons were under the direction of a master or padrone more or less inhuman, to whom belonged all the earnings of these persons. This system flourished most widely during the decade 1870-1880, and under its influence Italian immigration was stimulated to such an extent that the flow soon equaled the demand. The sphere of the padrone then changed. His work of inducing immigration was no longer necessary; immigrants came without having previously made contracts, and governmental action was aimed at preventing the importation of contract labor. Under these two influences—the great increase in immigration and governmental opposition—the character of the padrone has changed.

As a result of this demand for laborers and the activities of the padroni, the Italian immigrants have been largely males, and until recent years have not come by families, as have the other nationalities, notably the German and Scandinavian people. In the following table the total number of immigrants and the percentage of male and female are given for 20 years for the leading nationalities:

Total number of immigrants, and percentage of each sex, from leading European countries, 1868-1888.

Nationality.	Total.	Male.	Female.
		<i>Per cent.</i>	<i>Per cent.</i>
Germany.....	2,080,149	57.3	42.7
Ireland.....	1,083,191	49.4	50.6
England.....	980,255	60	40
Norway and Sweden.....	924,005	60.1	39.9
Italy.....	803,510	70.7	29.3
Russia and Poland.....	605,507	62.9	37.1
Austria.....	482,694	63	37
Hungary.....	313,964	70.1	29.9
Scotland.....	224,271	60.8	39.2
Total.....	7,587,546	60.6	39.4

Of the above nationalities the German, Irish, English, Scotch, Scandinavian, Austrian, and Russian showed percentage of males either below or not much above the average for all. This would indicate that these people came mostly in family groups, with the intention of permanent settlement. But the Hungarian and Italian immigrants showed very high percentage of males, which would indicate that the immigration was not of family groups, but of individuals.

II. PRESENT CONDITIONS.

Under these changed conditions it is probable that the padrone has very little to do with bringing Italians into the country, since it is no longer necessary to have a contract to bring them in, and because it is even unsafe according to Federal statutes. The padrone is now nothing more than an employment agent, and exists only because of the immigrants and their illiteracy and ignorance of American institutions. He procures his subjects at the port, upon their landing, by promising them steady work at high wages. If the immigrant does not get under the control of the padrone by this means, the immigrant need only go to the colony of his race in any of the large cities, where he will readily be picked up by one of the padroni and promised employment. By this means the newcomers are attached to the padrone, who is able to fulfill his promises, because he "stands in" with the contractors, he knows officials and bosses of the railroads, and he is thus in a way to furnish employment for his fellow-countrymen who can not speak English and have no other way of finding employment. It may then be said that the padrone system no longer exists, and that the successor to the padrone is an employment agency, which collects the labor only after it has already arrived in this country, and makes its profit through commissions and keeping boarders.

As Dr. Egisto Rossi, of the Italian Immigration Bureau, has summed up the situation, "The padrone system, or bossism, can be defined as the forced tribute which the newly arrived pays to those who are already acquainted with the ways and language of the country."

Though the character of the padrone is now that of an employment agent, it is undoubtedly true that no Italian has an employment agency license. But it is also true that in nine years there has never been a prosecution of an Italian for carrying on an employment agency without a license. His mode of operation is to go to the regular licensed agencies or to the contractors and furnish the men desired. The padrone also has no office of his own.

But the padrone does not employ the men alone and upon his own responsibility. He works together with the Italian banker, who is a somewhat more responsible party than the padrone; at least the men have more faith in him, because it is through him that they send money back to Italy, and with whom they keep their small savings. It is through the banker that the call is made for the number of men who are wanted, and it is in his office where the arrangements with the men are made. He may advance the money for transportation, and even the commission if the men do not have the money. The padrone takes charge of the men in the capacity of a boss, takes them to the place of work, runs the boarding house or shanty store at the place of work, and acts as interpreter for the contractor.

The padroni may be divided into several classes. The first class is the small boss who furnishes many odd jobs for individuals. The next class is the boss who regularly supplies contractors and others with laborers in large numbers. This is the largest class and really stands for the padrone as he at present exists. Finally, there are bosses who at the same time are independent contractors. But this is the exception, for the padrone, it may be said, is never a foreman and just as rarely an independent contractor. His work is to act as an interpreter for the foreman and run the boarding house or shanty store.

For furnishing employment he receives a commission from the laborer. This commission depends upon the (1) length of the period of employment, (2) the wages to be received, and (3) whether they board themselves. If they board themselves, the commission is higher and varies from \$1 to \$10 a head. For a job of 5 or 6 months the commission may even rise to \$10. In some cases the wages are paid to the padrone, but this is only when the contractor is dishonest and receives a share from the padrone. But if the contractor is honest, he knows that the people are generally cheated, and so he pays the men direct, deducting, however, the board and other charges as shown by the padrone.

Under this system the padrone is in combination with the Italian banker, who furnishes the money to pay for transportation, for the erection of shanties when they are not provided by the contractor, and to buy provisions. All this money is then deducted from the earnings of the men. The profits derived from the venture are finally shared by the padrone with the banker, who, however, finds his chief source of gain in holding the savings of the laborers, sending their money to Italy, and changing the money from American to Italian, in which process great shrinkage usually takes place.

The padrone has a further hold upon these people as a result of irregular employment. During the winter there is almost no employment at all. This means that during the greater part of 5 months these people are without work. When work is plentiful, the laborer who boards with his boss is said to be fortunate if he can save more than one-half of his earnings. Some of these earnings are sent to Italy or frequently squandered, so that the laborer often finds himself in winter without resources of his own. In such cases he finds it convenient to go the boarding house of the boss or banker, where he remains until spring, when it is understood that he shall enter the employ of the boss. In New York there are large tenements owned by Italian bankers which serve as winter quarters for these laborers. Here the men are crowded together, a dozen or more in one room, under the worst sanitary conditions. It is frequently said that the padrone encourages the men in extravagance in order to have a firmer hold on their future earnings. The employment is even made irregular by the padrone, who furnishes employment for several weeks at a time and then keeps them idle, claiming that the work is not regular.

In the Ninth Special Report of the Commissioner of Labor, on the condition of Italians in Chicago, it was found that 21.37 per cent of persons of whom the question was asked answered that they worked for a padrone. Of this number 5.96 per cent reported that they paid no commission to the padrone for securing the job, while 94.04 per cent reported that they paid a commission. It was found that an average of \$4.84 per individual, of the number reporting, was paid for the last job at which they worked, and the average time worked on this job was 11 weeks and 4 days per individual. The average amount paid per week to padrones for employment was thus 42 cents.

The Immigration Investigation Commission of 1895 found that from 500 to 600 laborers employed on sewers and waterworks padroni had deducted from their wages 10 cents and 15 cents each day for procuring employment.¹

¹ Report Immigration Investigation Commission, 1895, p. 26.

The padrone provides transportation for the men. But in the rates he overcharges the men, charging for first-class transportation or regular ticket rates, and securing greatly reduced rates because of the large number. If the work is some distance from the city, the padrone often boards the men, and usually buys the privilege from the contractor at a fixed rate per head per month. In some cases the privilege is given by the contractor free, because the padrone saves him trouble in employing men, and is convenient to have around in managing the men. But usually the contractor sells the privilege of furnishing the laborers with board and lodging and wearing apparel, the cost of which is generally deducted from their wages. In consideration of the many advantages which the padroni have in this transaction, they generally have to pay pretty high prices for the privilege, which naturally comes out of the pockets of the immigrants. If the men board themselves, their food must be bought at the shanty store, which is operated by the padrone. Notices are posted to this effect, and fines are imposed for disobedience. Even dismissal is often the penalty. Occasionally a fixed daily amount of purchases is required by the padrone, but usually the men are allowed to spend at their pleasure, but only at the padrone store. For example, in 1894 Italian laborers were shipped from New York to Brunswick, Ga., for work on a sewerage contract. Each man paid the padrone \$1 for finding the employment. The passage money, \$7 per head, was paid by the banker with the understanding that this was to be deducted from their wages. The agent of the banker paid \$25 a month rent for 10 huts, but charged each laborer \$1 a month, which for 215 men was \$215 a month. All supplies had to be bought at the shanty store, the penalty for disobedience being a fine of \$5.¹

The quality of the food is as a rule very low even for Italians, and the prices are extortionate. The investigation of the United States Department of Labor (Ninth Annual Report) of the Italians in Chicago showed, among other things, that "the prices charged by padroni are frequently double those charged in Chicago markets for similar articles of food of the same quality" (p. 50). The average increase over Chicago prices was as follows:

	Per cent.
Bread	82.19
Macaroni.....pound..	61.11
Macaroni.....box..	50.33
Cheese.....	46.02
Tomatoes.....	65.38
Sausages.....	72.40
Bacon.....	69.91
Lard.....	77.04
Sugar.....	44.58
Coffee.....	74.70
Tea.....	80.00
Beans.....	61.70
For all articles of food combined.....	59.55

In the Bulletin Department of Labor (March, 1897, p. 118) it is said: "The provisions are furnished in a raw state, and cooked, if at all, by the men themselves. The food furnished by the boss is usually of an inferior quality and often unfit for consumption." The following table is then given showing the prices of articles sold at a shanty store "not far from the city of New York" and the average market prices in New York:

Prices of commodities at shanty stores and at New York market compared.

Article.	Unit.	Shanty price.	Market price.
Macaroni.....	Pound....	\$0.10	\$0.03
Bread.....	Loaf.....	.10	.04
Lard.....	Pound....	.20	.06
Cheese.....do	.25	.08
Vegetables (sold by weight).....do	.10	.001
Codfish.....do	.10	.05
Olive oil.....	Gallon....	2.00	1.00
Meat (when sold).....	Pound....	.15	.05
Tobacco.....do	.50	.25
Beer.....	Bottle....	.15	.04
Wine.....	Gallon....	.80	2.50

¹ Report Immigration Investigation Commission, 1895, p. 20.

² Approximate.

It is seen from the above table that the prices paid at the shanty store of the padrone are from 2 to 3½ times those of the market prices, while in the case of vegetables the shanty price was 30 times the New York market price.

Besides the profit from supplying food to the men, the padrone charges from \$1 to \$3 a head for the shanties in which the men sleep. These shanties are often furnished without charge by the contractor, but the padrone nevertheless charges the men a rent to pay for his boarding privilege. Sometimes he even charges regular fees for medical service, though a regular physician is called in only in very serious cases.

As to the wages, it is seldom in Eastern States that only \$1.25 per day is paid, though in 1894, 1895, and 1897 wages were \$1, with very little work to be had even at that price. At present they vary from \$1.35 to \$1.75 per day. In the investigation of the Department of Labor (Ninth Annual Report, *Italians in Chicago*) it was shown that the average weekly earnings for Italian males were \$6.41, and the average hours of work per week were 59.4. The highest average weekly wage was \$8.25 in manufactures and mechanical industries, and the next highest was \$7.64 in agriculture, fisheries, and mining. But this throws no direct light upon the wages or earnings received under the padrone. Under the earlier padrone system the padrone would import laborers under contract for 75 cents per day for two years' work. But the padrone could get \$1.25 per day from railroads and contractors, and this difference would go to him. At present he is only an employment agent, and the wages are usually paid direct to the men, though only after the deductions have been made in favor of the padrone.

In the investigation of the New York Bureau of Labor Statistics into the alien labor employed on State contract work on the Erie Canal (Report 1898, p. 1153) it is stated that there were 15,000 common laborers employed, of whom 1,000 were American citizens, 13,500 were Italian aliens, 350 Poles, and 150 Hungarians. The highest wages paid these laborers was \$1.75, and the lowest \$1.20 per day. Of this number 600, or 4 per cent, received \$1.20; 4,420, or 30 per cent, received \$1.25, and 9,794, or 65 per cent, received \$1.50, which shows that the rate for this labor, of which Italian aliens made up 90 per cent, was from \$1.20 to \$1.50 per day.

As to the amount of employment the investigation of the Commissioner of United States Department of Labor (Ninth Special Report, *Italians in Chicago*) shows that out of 2,663 persons employed in remunerative occupations 1,517, or 56.97 per cent, were unemployed some part of the year. The average time unemployed for these 1,517 persons was 7.1 months; for the 109 females in the number it was 6.4 months, and for the 1,408 males 7.2 months.

The nominally small earnings of these people thus become really very small when it is kept in mind that they are unemployed on an average from 5 to 7 months during the year, and must live during this time on the small savings which they may perhaps have been able to put aside from their earnings.

As to the kind of labor, it may be said that the padrone undertakes to furnish only unskilled labor in the large cities, though the Immigration Investigation Commission of 1895 reported (p. 27 of the report) "that padroni in New York not only guarantee to supply unskilled labor for sewer, railroad, and waterworks construction, but also skilled labor for building trades, and will, furthermore, arrange for their transportation to a remote point if a small percentage of the passage money is advanced or guaranteed."

But in the country and small towns the padroni stand ready to furnish skilled workmen, masons, carpenters, stone cutters, and machinists. Occasionally Italians are employed through padroni in the endeavor to break a strike. For example, in the lockout in 1892-93 of the granite cutters Mr. Duncan testified before the commission that Italians were employed to take the places of the union men. But he said that they were inefficient and had to drift out of the work because of the minimum wage rate established by the union and the desire of the employer to have only the most profitable men. The general secretary-treasurer of the Granite Cutters' National Union describes a padrone system in New York City which was prepared to supply men to employers in the granite-cutting trade. The union has an 8-hour day with \$4 in New York. The padrone gathers the Italians, who comply with the State law by declaring their intentions for citizenship. These men pay the padrone \$12 commission, \$6 remaining on deposit as a guaranty that at the end of the week the man supplied with work shall return \$6 to the padrone; if not, his employment ceases. These \$6 per man per week are paid by the padrone to the contractor, who has thus employed men at \$3 under a \$4 law in New York, which provides that mechanics employed in the State upon municipal, county, or State work shall be paid the prevailing rate of wages and work the prevailing hours. This is one of the very rare instances where skilled labor is furnished in New York by the padrone system, and it can not be taken as representative of the system.

The Italian immigrant, however, does not always limit himself to becoming a common laborer on railroad work and other excavations, but often becomes an artisan. In so far as he becomes an artisan he comes in conflict with American workmen, but the conflict is less sharp than formerly, because the American unions are

organizing Italian labor. The Italians themselves are coming to understand the importance of organized labor. This is noticeable especially among the Italian hod carriers, masons, and stone cutters, and where this feeling and sense of organization has developed there is no opportunity for the padrone system.

III. PADRONE SYSTEM ON PUBLIC WORKS.

Formerly the padrone furnished men to contractors in city departments, water-works, and street-cleaning departments. To see to what extent this is now practiced letters were sent to the mayors of different cities. The questions asked were as to employment on public works, whether aliens or citizens were employed, the nativity of aliens and parentage of citizens, whether employed through agencies or padrone, and whether the work was performed by the city directly or by contracts. The next question dealt with regulations, whether there were any clauses in contracts or ordinances stipulating the wages, hours, and citizenship of employees on public works, and whether such regulations were the result of legislative or municipal enactments. Finally, what were the prevailing wage and hours for common laborers under contractors on public work, on private work, and under direct municipal employment. The following tables show the answers received:

Employment of aliens upon public works in cities.

Cities.	Employment.		Regulations.		Wages and hours of common laborers.

1 Italians.

It will be seen from the above that there is no marked influence on municipal employment by the padrone system. In the Eastern cities regulations are the rule both by councils and by State legislatures. Even in the cases where Italians were employed, answers were received stating that no laborers were employed through padroni, but usually by the city direct and even directly by the contractors, because in every case it was stated that the supply was greater than the demand. The only city from which an answer was returned showing that agencies are common was Portland, Oreg. Upon this point the letter said: "There are a number of agencies in this city. They are licensed by the municipality and are required to give a receipt to each person from whom they receive money as a fee. The receipt shows the amount of the fee paid, where employment is to be secured, and the wages to be paid. All the employment agencies have been kept under strict police supervision, and as a result there is little or no complaint against them." But these are not in any way connected with the padrone, who is found only in a few of the largest cities, principally in the East.

The stipulations as to citizenship are expressed at considerable length by an ordinance of the city of Philadelphia in connection with an act of the State legislature.

The following is received from the Philadelphia director of public works:

In reply would state we have in all our specifications a clause stating "any contract awarded under these specifications will be subject to the provisions of an act approved June 25, 1895, entitled 'An act providing that none but citizens of the United States shall be employed in any capacity in the erection, enlargement, or improvement of any public building or public work within this Commonwealth,'".

This matter is also governed by ordinance of councils.

AN ORDINANCE providing for the employment only of American citizens by contractors doing work for the city of Philadelphia.

SECTION 1. The select and common councils of the city of Philadelphia do ordain, that in all contracts hereafter let by the city of Philadelphia or any department thereof for the construction of public buildings, waterworks, sewers, or work of any kind involving the employment of labor, there shall be a stipulation or covenant embraced in the contract that the contractor or contractors shall not employ any laborer, artisan, or mechanic upon the work undertaken or contracted for by him or them who is not a citizen of the United States: *Provided*, That the provisions of this section shall not apply to public work where the cost thereof is paid in whole or in part from assessments of benefits.

SEC. 2. That for every person who has not qualified as provided in section 1, who may be found in the employment of such contractor or contractors on such city work, he or they shall, in said stipulation or covenant, agree to forfeit five (5) dollars per day for every day that such person shall have been employed as aforesaid, and shall, in said covenant, authorize and empower the head of any department where such person or persons are employed to deduct from any sum or sums of money due said contractor under such contract the said sum of five (5) dollars per day for each person not a citizen of the United States, but employed as aforesaid, as liquidated damages for the failure of said contractor or contractors to observe and perform in this respect the conditions or terms of his or their contract.

SEC. 3. That it shall be the duty of the departments to ascertain and require satisfactory proof of the citizenship of the laborers, artisans, or mechanics employed upon such work, and to keep a record of the number of days or fraction thereof upon which any person not a citizen as aforesaid shall have been employed.

SEC. 4. That it shall be the duty of the city solicitor to insert in all contracts as aforesaid, and in all specifications of work to be done under such contracts, the stipulations and conditions provided for in this ordinance.

SEC. 5. That any ordinance or part of ordinance conflicting with the provisions of this ordinance be and the same is, hereby repealed.

Approved this sixteenth day of December, A. D. 1896.

In New York State, by act of the legislature, certain clauses were required to be inserted in all contracts for public work. A copy of these stipulations contained in all city contracts for public works in Yonkers, until the recent decision of the court of appeals with regard to the prevailing rate of wages, is here given. The following is from Yonkers, N. Y.:

The contractor for work under this contract, and each and every subcontractor or person employed by such contractor to furnish any part of the materials required under this contract, will be required to observe all the laws of the State of New York in relation to the employment of citizen labor [the wages to be paid to each class of labor employed], and the hours constituting a day's work; and he shall also furnish to the mayor and city clerk, whenever required, affidavits made by him and by each and every subcontractor that all the requirements of said laws have been complied with.

The contractor for work under this contract [agrees to comply with the provisions of chapter 567 of the laws of 1899, and] agrees that no laborer, workman, or mechanic who is not a citizen of the United States shall be employed by him or by any subcontractor in the performance of any work to be done under this contract, and further agrees that no laborer, workman, or mechanic in his employ or in the employ of any other person doing the work herein contracted for shall be permitted or required to do more than eight hours' work in any one calendar day, except in cases of extraordinary emergency, caused by fire, flood, or danger to life or property; [and he further stipulates that each laborer, workman, or mechanic employed by him or his subcontractor or any other person on or about the work herein contracted for shall receive for each legal day's work a sum not less than the prevailing rate of wages for a day's work in the same trade or occupation in the city of Yonkers. And this contract shall be void and of no effect if the contractor or his subcontractor or any other person on or about the work herein contracted for shall employ on any work herein contracted for any person who is not a citizen of the United States; and this contract shall be void and of no effect unless the contractor and his subcontractors shall comply with the provisions of section 2 of chapter 415 of the laws of 1897, as amended by chapter 567 of the laws of 1899].

These clauses were required by acts of legislature to be inserted in all contracts for public work. Since the decision of the court of appeals in the spring of 1901 declaring the provision of the law relating to the prevailing rate of wages to be unconstitutional, the parts of the above included within brackets have been eliminated from the contracts.

IV.—EMPLOYMENT OF ALIENS ON RAILROADS.

A further inquiry was made into the employment of aliens as common laborers on railroads and the larger public improvements in different States. The object in view was to find what wages were paid; whether or not the labor was secured through padroni or employment agencies; if so secured, what deductions were made by such agencies from the wages paid; finally, as to the extent to which immigrants have displaced Americans as common laborers on railroads. To this end letters were sent to State bureaus of statistics and labor. The results are shown in the following table:

Aliens employed on railroads and public improvements in different States.

States.	Wages paid per day.	Hours.	Secured through padroni or employment agencies.	Displacement of American labor.	Nationalities.
Maine	\$1.25		Yes, from New York and Boston.	American by Irish, then French Canadian, now Italian.	Italian; work for 25 per cent less than others. French Canadian; Irish. Italian and French Canadian.
New Hampshire					
Connecticut	1.00 to 1.50	10	Yes; especially in Bridgeport. Padroni deduct 25 cents per day.	Entirely	Mostly Italian.
North Carolina				No influence from immigration.	Railroads built largely by convict labor. Cheap labor is negro.
Tennessee	1.50		No		Only a few Italians in the mines.
Kansas			No	11 per cent laborers are foreigners.	
Montana	12 00		Italians and Austrians are shipped into the State through agencies.	75 to 80 per cent foreign labor in smelters.	Italian, Austrian; Cornish and Irish miners; Japanese on railroads.
North Dakota	1.40	10	Yes; shipped from Chicago and the East.	Displace Americans by working cheaper.	Italian, Russian, Hungarian, Norwegian.

¹In smelters.

In the above it is shown that the employment of foreign immigrants through agencies and padroni is extensively practiced in the North, both East and West. But the wages are not found to be unusually low. Very little, however, is brought out concerning deductions or commissions for the padroni. In Bridgeport, Conn., it is said that the padroni had been in operation to a great extent, and that as much as 25 cents a day for each laborer is deducted. Nearly all street railways in Connecticut are built by contract, and the contractors procure the laborers through padroni. "This evil has grown to such magnitude in the State that the general assembly * * * has before it 2 measures intended to eliminate the possibility of a continuance of the practice." In this railway construction the American labor has been entirely displaced by alien or foreign labor.

In Maine the American labor in construction of large works was displaced by the Irish, then by the French Canadian, and now the Italians brought from New York and Boston have displaced all others and work for \$1.25 per day, which is 25 cents less than the wages paid to other nationalities. In the ordinary repair of railroads no Italians are employed, and in the construction of short lines, where small gangs of men are employed, the work is usually done by French Canadians, with some Irish and Americans. "It certainly would be a difficult thing at the present time to build a railroad of any considerable length without Italian labor."

In New Hampshire the labor employed in constructing railroads and section men used in grading is largely foreign. Italians are employed principally in constructing railroads. The Italians and French work at a less rate than the Americans. "I

do not think that foreign labor has displaced American labor to any extent, for the reason that there seems to be plenty of work for all who wish to labor."

In the Southern States the percentage of foreigners is so small that there is no influence from them on common labor for which the negro is employed.

In the case of the common laborers on the Pacific coast it will be found that they are mostly Chinese and Japanese. In Montana the Japanese are employed on the railroads, while at the smelters the Austrians and Italians are employed. The mining is in the hands of the Cornish and Irish, with a few Italians and Austrians. The extent to which this common labor at the smelters is performed by foreigners American labor is displaced. All this common foreign labor is "shipped into Montana through employment agencies and such mediums acting in concert with the corporations and at their instance."

In North Dakota it is held that the railroads could not get American laborers at \$1.40, so the foreign labor is shipped in from Chicago and displaces Americans by working for less money.

V. SYRIANS.¹

The immigration of Syrians into the United States commenced to attain significant proportions some 10 years ago, and has grown steadily until at the present time there are probably 25,000 of these people in the United States, of whom 6,000 claim a residence within the Greater New York. Boston possesses a colony 1,200 strong, and smaller settlements exist in all large cities and in many towns. Such colonies are for the most part aggregations of traders. Only in a few mill towns does the Syrian rank as a proletarian. The cities of Lawrence and Worcester, Mass., are unique (Scranton, Pa., and Paterson, N. J., in lesser degree) among American cities as each possessing a considerable population of industrial Syrians. There appears to be a growing tendency to enroll Syrian workers among the working forces in the textile industries, particularly in silk and cotton mills. The creation of a Syrian-American proletariat, however, is slow, although now apparently an assured fact. The strong trading instinct characteristic of the race militates against the acceptance of factory life as a finality. It is as a small trader (shopkeeper) or itinerant trader that the Syrian is better known. "Business" is his lodestar, and in pursuit of it he penetrates if necessary the most remote parts of the Union. No nook escapes him, and neither Canada, Latin America, the West Indies, or the Philippines is foreign to his enterprise. New York, however, always remains his base of supplies, and it is to New York that he plans to return after trying his fortune elsewhere, for in no other American city does the colony of his people attain such numbers and importance. Notwithstanding the superficial scope of his enterprise, an unstable, too versatile, and constitutionally indolent temperament tends to restrict his energies to the nomadic and parasitic pursuits rather than those truly useful to the community.

It is asserted by representative Syrians that within the past 30 years four-fifths of the young men of Mount Lebanon have been impelled to seek in foreign lands the opportunities denied to them at home, and within the same period an aggregate of 1,000,000 Syrians have migrated. Syrians of all factions are practically unanimous in ascribing to the rapacity and misrule of the Porte this wholesale expatriation. While of late years America has become more directly the "land of promise" to these emigrants, Great Britain, and her Asiatic dependencies, the South American republics and Egypt, together with the Mediterranean countries, have absorbed large numbers of the exiles.

So far as the United States is concerned it is primarily to American missionary effort and advice that we owe the diversion to these shores of so large a portion of this stream of dissatisfied Turkish subjects. The influence of the Protestant missions in this direction can hardly be overestimated, and has been the means of introducing thousands of Syrians to increased opportunities. Broadly speaking, the well-intentioned efforts of the missionaries have been abused by their protégés.

Nine-tenths of all Syrians are Catholics, belonging to the Greek or Maronite branches of the Roman Church and to the Metawile and other Catholic sects. The majority of those coming to America are Orthodox Greek Catholics, the Maronites being next in number.

But very few Druse and Mohammedan-Syrian families come to this country. A relatively large proportion of the Greeks and Maronites have coquetted with Protestantism in one way or another; usually perhaps through missionary offers to secure an education, and particularly a knowledge of English, for their children. It is these alleged proselytes who have contributed largely to bring into relief the

¹ Information furnished by Mr. James Forbes, district agent of Charity Organization Society, New York.

intrinsic servile character of the Syrian, his ingratitude and mendacity, his prostitution of all ideals to the huckster level. No sooner are they landed than they seek the commitment to institutions of such of their children as have not attained working age, usually importuning returned missionaries and their friends until they succeed. They then, as a rule, affiliate themselves with some Protestant church or mission, abandoning such connections when no longer deemed necessary or profitable. Cases are not infrequent in which a bright young protégé has been educated at a theological seminary here for the express purpose of returning to preach the gospel and when graduated has coolly repudiated his contract upon the plea that he could do better here in trade.

The versatile genius of the Syrian, as evidenced alike in his cosmopolitan scope of trading enterprise and his readiness to use religion as an expedient, is reflected in the principal concession he is willing to make to occidental competitive methods. As has been said, the Syrian, due perhaps to climatic influences, possesses an ingrained indolence better suited to oriental bazaar methods than to American business life, and though entering into direct competition with Americans and men of other races in America only in a small degree, he finds it necessary to make a concession, the more significant when we consider woman's position in the East. This consists in sending his wife and daughters, or the wives and daughters of his countrymen, out to peddle from door to door the silks, rugs, bijouterie, and antiques in which he traffics.

A few Syrians are honest enough to express themselves as ashamed of and opposed to this system, but the majority, and this is especially true of the wealthier ones, continue to employ it as a profitable adjunct to their business. The usual defense of such men is that the superior intelligence of their women and the fact that they call only at the homes of the well-to-do insures them against both insult and misinterpretation.

Notwithstanding such excuses the system has been justly exposed to severe criticism—the begging propensities of the canvassers having contributed to this effect—and the more hypocritical Syrian merchants now pretend to deprecate the practice, affecting to speak contemptuously of the hillfolk from the Zahle district as being the principal offenders. The truth is that the poor Zahle folk are in this merely the imitators, when not directly the drudges, of their wealthier compatriots. The real offenders are merchants (so called) whose cupidity and indolence, reinforced by an exaggerated patriarchal authority, enable them to make this use of the pleasing appearance, glib tongues, and insinuating manner of their women. The latter, however naturally disinclined at first, soon become habituated to the work, the younger women especially liking the travel and excitement. Particularly does this class of Syrian realize the worst attributes of the parasite—the man brutally arrogant to the poorer members of his own race and fawningly servile to Americans and all those from whom he considers there is something to be gained; the women mendacious and intriguing, sitting from the White Mountains to Palm Beach, from Mackinac Island to Hot Springs, as the season varies, following as closely as possible the wake of the wealthy.

With the peasant people it is different; the instincts of self-preservation and emulation argue for leniency in judgment toward them. It often happens that the principal asset of a peasant immigrant family consists rather in a claim to kinship with some more prosperous member of their race than in the small amount of cash and belongings they bring along. Such a claim based upon the patriarchal system which retains much of its vigor in Mount Lebanon soon becomes little more than a tradition—and an inconvenient one—in the eyes of Americanized Syrians materially prosperous.

Nevertheless, such claims still force a certain recognition and are apt to be met by the extension of small credits, enabling some member of the family—usually the husband—to commence peddling with an English understanding companion, or else secure transportation for the family to a mill town where they have friends. If the man goes peddling, his wife and children will find shelter with some poor family from their own village, and the woman and girls turn their attention to the manufacture and sale of the lace which all Syrian women and girls can make. Desperately poor—for the making of enough lace to sell on Fourteenth street for 25 cents will take 6 hours, and receiving little or nothing from her wandering husband whose income at the best is very small—the Syrian mother attempts to emulate the example of her wealthier kin and sends her elder girls out with satchels of lace in the hope of realizing better prices by going from door to door in the residential parts of the city. Such a course leads naturally to begging and ultimately to action by the Society for the Prevention of Cruelty to Children.

It is not alone in the matter of begging under the guise of peddling that the poorer Syrian ranks as an imitator—in the matter of the "boarding school" he is as insistent and tricky as his more prosperous relatives. Cases have been known in which

¹ Some public or private institution like New York Juvenile Asylum, Catholic Protectory, etc.

Syrian families of this class have applied for the commitment of 4 out of 5 children *within 20 days after landing, all details as to alleged residence, widowhood, etc., being carefully "fixed up" by hucksters common to the quarter, and despite many rebuffs have finally succeeded in having the children accepted as charges upon private benevolence prior to departure of parents and elder child to a mill town.*

At the present time it is a rare thing to find a young man or woman of the quarter who has not passed several years in the "school." Education is not primarily the benefit sought, a relief from natural responsibilities (rarely justified) is rather the reason, the nomadic life led by so many Syrians and the unfortunate association of institutions with missionary training schools in the Syrian mind influencing the result.

No such anxiety is shown to take advantage of the public day-school system; less than 100 Syrian children are regular pupils at the public and parochial schools of the quarter (Manhattan). As a rule these pupils are regarded as merely "bright" rather than as possessing the application necessary to become scholars. Some years must elapse before the influence of day-school education will have had a chance to make itself felt in the quarter. A Syrian educational society, supported chiefly by American Protestant effort, maintains a day school in which Arabic-speaking children are prepared for entry into the primary grades of the public schools. The attendance is small and irregular.

Throughout the country the same predilection of the Syrian parent for the "boarding school" prevails, though naturally not so strongly expressed outside of New York, and not so apparent in communities in which the Syrian approximates to the industrial rather than to the nomadic type. In so far as morality is concerned, the Syrians in America compare quite favorably with other nationalities. Early marriages are the rule, and the bride of 15 has usually been affianced by her parents for several years previous to the event. Café gossip, an important factor in Syrian social life, acts as a deterrent of flagrant scandal, although when such scandal does occur, public opinion appears to accept the situation complacently.

The Syrian in New York has housed himself in the tenements of the old First Ward, from which he has dispossessed an undesirable Irish population, the remnant of which torments him. Hemmed in by the Broadway business district to the east, Battery Park on the south, the North River on the west, and the Cortland street ferry and contiguous business section upon the north, the Syrian quarter in Manhattan covers an area comprising in effect four blocks upon lower Washington street and overflowing into the short side streets.

Long threatened by the invasion of the "skyscraper," this immediate tenement section has remained almost undisturbed for the past 50 years, although surely destined to become a region of "skyscrapers" at a future date. The Syrians appreciate this, and a considerable number of the well-to-do have removed their families within recent years to South Brooklyn, retaining their places of business upon lower Washington street. The poorer immigrants, both because of these business establishments and nearness to the Barge Office, naturally cling to the first established colony.

The tenements of this quarter are, as a rule, old and in bad condition; nor does a Syrian occupancy improve them from a sanitary standpoint. The poor Syrian contracts to pay \$5 to \$7 for two rooms, and as his family is usually a large one, and the rent out of proportion to his income, he resorts to overcrowding as a relief. Sometimes he is able to get one room for \$4 a month, and proceeds to crowd his family of 7 persons into it.

It is not extraordinary to find 6 or 8 women making their headquarters in such a garret, their husbands away peddling and their children in institutions. The entire number seldom occupy the room upon any one night. The Syrian pays his rent, and is accordingly considered a good tenant by agents of a certain class. He at least is sober, and seldom gets into "trouble." The one Syrian who attempted to run a hotel in the quarter was glad to surrender his license and save what rebate he could from the failure.

The American cooking stove is the first new necessity which impresses itself upon the Syrian immigrant's mind. It is often months before the need of a bed makes itself felt; a rug or blanket upon the floor suffices for sleeping purposes. A few chairs and sacred pictures, together with a lamp, are next accumulated, and poor households are not much more ambitious in the way of furnishings. The better class (so called) of Syrians pay from \$8 to \$20 rent for their living rooms and \$20 to \$100 rent for their stores. A certain luxury is often apparent in the rugs and curtains found in such homes, but in the furnishings little else that is not American in tone and of a cheap class. In cleanliness and sanitation the homes of supposedly well-to-do Syrians approximate quite too closely to those of the poorer class. In this respect it may be noted that a majority of the wealthy Syrians in New York (of whom there are a score reputed as worth over \$10,000 and up to \$40,000) are of peasant extraction and have concentrated their energies upon the dollar rather than upon the better aspects of Americanism.

As to citizenship, there are not more than 300 fully naturalized Syrian-American citizens in New York City, but this is rather because of the colony's youth than because of any disinclination for the privileges of citizenship upon the Syrian's part. The younger men become citizens and vote the Republican ticket as a "business-man's" ticket.

It should be borne in mind that the Irish-Americans of the First Ward are Democrats. No strong organization, political or otherwise, may be looked for among the Syrians, the envies and jealousies of these people serving invariably to wreck such attempts, whatever their inception. Such has been the fate of a dozen relief and benevolent societies established in the quarter, as a result of advice that the Syrians look after their own poor, at least to a reasonable extent. The societies in question have generally been as short-lived as ill-managed, and notoriously was this the case with a day nursery subscribed for by Americans and managed by Syrians.

Despite inherent disorganization, a "revolutionary party" exists, and has a local press which immolates the Porte at intervals, but is reputed to savor somewhat of blackmail.

Relatively the quarter has a large number of journals, it being the ambition of every faction to be so represented.

Apart from female and missionary influence, there are Syrians who seek to add to their incomes by "placing" their immigrant countrymen, and were the assertions of these fellows as advocates of Syrian "help" borne out by experience to a reasonable extent we might witness the development of a "padrone" system. Fortunately there are reasons why such a development will not take place, of which "supply and demand" is the principal one.

The Armenian immigrants resemble the Syrians in their inclination to trade rather than industry. The majority of the estimated 15,000 in the country are traders. A large number of them work for large Armenian firms dealing in oriental goods. There are a number of Armenians in New York who are cigarette makers. Some are working in the silk factories, and there are small storekeepers scattered through the country. The poorest of the Armenians do not come here. All who come are former business men who have been persecuted and driven out by the Turks. They come, intending to stay and become American citizens. It is estimated by a leading Armenian that there are 1,500 Armenians in New York, 2,000 in Worcester, Mass., 2,000 in Boston, 400 in Philadelphia, 500 in West Hoboken, 300 in Paterson, and 300 in Chicago. In Worcester, New York, and Philadelphia they have their own churches.

The manufacturing interests of the Syrian in America are confined almost exclusively to one quarter in Manhattan, and are increasing to meet the demands of the Syrian trade throughout the country. Combs, brushes, hat pins, razor strops, bibs, tuckers, aprons, wrappers, garters, suspenders, toothpicks, crucifixes, and small peddling truck generally, is made, and practically for the Syrian peddling trade only. The manufacture of these articles is carried on in lofts, and rarely in tenement houses. The wages paid, mostly upon a piecework basis, average \$2 to \$3 per week for women and \$4 to \$6 for men. Occasionally children under age are employed, but as a rule the Syrian is too shrewd to expose himself to possible penalties. The supply of cheap Syrian labor is abundant in the quarter, and none but Syrians are employed by Syrians. While from 15 to 20 per cent of the Syrian population in America is dependent upon textile-mill work at the present time, the Syrian as a mill worker still remains an experiment. His docility as a proletarian is offset from the managerial standpoint by his fatalism—if driven too hard he simply lies down. Less vigorous than the French Canadians, Poles, and "American-born" mill-workers with whom he competes, he is much less fettered than they. Worked too hard or paid too little in the mill, he becomes a peddler; a member of no "union," he still has at his command in traditions—always retaining their hold longest upon a peasantry—resources which, among his own people, can hardly ever fail to secure for himself and family at least the necessities of existence. Employers claim to pay to Syrian workers the regular scale, and this claim is not seriously disputed by non-Syrian textile workers—the fact appearing to be that the textile wage scale is already as low as the subsistence level, and the Syrian not tending to raise that level. Instances have occurred in which silk-mill owners have used Syrian help in attempts to break strikes, but only rarely and as a war measure. The Syrian does not, as a rule, develop into a valuable mill adjunct, either as a strike breaker or otherwise. Appearances indicate, indeed, that mill owners have been to some extent the victims of cajolery in relation to the value of Syrian help.

In a silk mill in New Jersey where Syrians and Armenians have recently been introduced there are about 25 warpers, about 25 twisters, and about 25 fixers, all German or American, and their wages run from \$14 to \$18 a week. They were the first to come into the business and have an organization which is protecting the price of their labor. In other mills there is a number of Italians and Jews recently introduced.

There are about 40 winders, American girls for the most part. They begin at \$2 a week. The Syrians and Armenians are employed in weaving, the price for which in the last four years has declined about one-third. The work for which formerly 12 cents was paid is now 8 cents. In 1900 occurred a strike in the shop against a reduction in wages. The factory was closed for ten weeks, when Armenian and Syrian labor was brought from New York and other places to replace the former labor. There are now about 250 weavers, 150 of whom are men and 100 are women. The men, since the strike are divided as to nationality about as follows: 50 Jews, 25 Armenians, 25 Syrians, 15 Germans, 20 Americans. The 100 girls are divided in about the same proportion, except that there are more Americans among the girls.

A large number of the weavers have their wives working with them in the factories, and a number of wives take work home. They receive about 40 cents for 75 yards, and can earn from \$3 to \$4 per week. Using one loom a weaver can make 15 yards of goods, and using two looms he can make 30 yards a day, at from 6 to 11 cents per yard. On the 11-cent goods he can not make 15 yards, so that he is able to earn about \$8 to \$12 a week. The majority of the weavers earn \$9 a week.

The proprietor states that the Syrians have an instinct for weaving, and learn it very rapidly. They come to the mill, and, as a rule, have to work about a week without pay; then they earn from \$3 to \$12 per week—men, women, and children. The mill proprietor rents them small frame houses near the mill for \$9 per month. A large majority of them live in this settlement. They are apparently clean, thrifty, and fairly temperate; from all reports make quiet, peaceable citizens. The proprietor much prefers them to Armenians or Italians for his purpose, and as his business increases he will be glad to increase his force of Syrian operators. Now and then a Syrian will apply for work, and they will give him an opportunity to learn, but if he finds he is not capable of learning he gives it up, and they never see him again. It is supposed they return to New York.

The problem of labor organization is especially difficult where the Syrians and Armenians are concerned. The other nationalities distrust them. It is claimed by the organizers that they can get along very well with the Germans, Irish, Jews, Italians, and Americans, but not with the "Turks." However, the price of labor has come down to such an extent that the Syrians are now dissatisfied, and have recently made their first overtures to get into line with the other nationalities.

Notwithstanding what is said above, the decline of wages in silk weaving in New Jersey can not be ascribed solely to the influence of immigration of Syrians and Armenians or of other nationalities. The secretary of the Silk Association of America in his report for 1901 (p. 29) speaks of the surprising development of the industry in Pennsylvania, and ascribes it to "the abundant supply of female labor. In New Jersey, for instance," he says, "the percentage of men operators employed in the silk mills is 47, the percentage of women 48, and the percentage of children 5. In Pennsylvania the respective percentages are as follows: Men, 24.4; women, 53.6; children, 22." These factories in Pennsylvania are usually in country districts.

CHAPTER VIII.

IMMIGRATION FROM CANADA.

The position of Canada with reference to immigration into the United States is twofold: First, the movement of Canadians across the border for permanent residence or temporary work in the busy season; second, the rear entrance, whereby European and Asiatic immigrants, who would be barred at the American ports, nevertheless effect an entrance. The latter phase of Canadian immigration properly belongs to a description of the administration of the Bureau of Immigration, and will be found in later pages dealing with that subject. At this point it is proposed to consider only the immigration from Canada proper, and its effect on American labor.

The points at which Canadian immigrants enter the United States are mainly Boston, Buffalo, Detroit, and Sault Ste. Marie. Intermediate railway stations of importance are those along the frontier of Maine, Vermont, and New York. Many immigrants enter the States by way of the Great Lakes. The ferries at Detroit and Buffalo require only 5 to 15 minutes in transit. Consequently large numbers of people making their homes on the Canadian side cross over daily for their regular employment. At Detroit about 500 or 600 Canadians come over every day on the ferries and go back at night, while about 50 Americans work on the Canadian side. Those who come from the Canadian side are usually laborers, but they include also large numbers of stenographers, typewriters, and clerks.

The cost of living is about the same in Canada, except that rents are cheaper; probably no more so than in the suburbs of Detroit on the American side—Windsor being practically a suburb. The Americans who work on the Canadian side are the higher grade of skilled laborers—foremen and the like—and often their pay is higher than that of Canadians in the same line. On the other hand, the pay of Canadians working on the American side, while it is usually the same as that of Americans, yet in several trades it is claimed that employers prefer them because they are more subservient.

In general, wages on the Canadian side, especially in cities like Toronto, are about the same as in Detroit. Consequently there is not the inducement for immigration that formerly existed. The skilled trades where the greatest complaint is made are those of bricklayers, carpenters, plasterers, and clerks. The bricklayers claim that during the summer season half of the bricklayers in Detroit are Canadians. The wages since 1898 have been \$3.60 for 8 hours; prior to that time they were \$3.50 for 9 hours. Corresponding wages in Toledo are \$4; Chicago, \$4; Denver, Omaha, and Kansas City, \$6.

Canadians do not cut wages, but by flooding the market they keep them from rising to the standard of other places, such as Toledo and Chicago. Wages in Toronto are about \$3 per day of 8 hours.

Formerly the bricklayers' local union charged an initiation fee of \$20, which kept out Canadians, but since they have joined the international union an initiation fee paid to the Canadian local permits Canadians to work on the American side, since they belong to the same international. The bricklayers had a strike in 1894 and many Canadians came in as "scabs." The carpenters were similarly affected in 1890, when the strike was weakened by the immigration of "scabs." The plasterers have not been seriously interfered with, not more than 3 or 4 Canadians having come over in the course of a year, and very few scabs. They have had no dispute in 14 years.

The plumbers are not affected. Clerks complain more than any other occupation. Pattern makers do not complain to any extent. Wages in the large towns in Canada are equal to those in Detroit.

Shoemakers do not complain, since the organization is growing in Canada faster than in the United States, especially at Hamilton, Toronto, and Montreal.

The increased business prosperity, creating a demand for labor in Canada as well as in the United States, has weakened the pressure of immigration. The main trouble is in the time of strikes, and Detroit has been free from these in recent years, owing to the better organization of the trades council.

It is very generally agreed that the inspection at Detroit under Mr. C. C. McGlogan, who was immigration inspector from May, 1893, to March, 1897, was effective. Formerly large gangs of French-Canadians would cross the border accompanied by the agent of contractors for the lumber fields. Mr. McGlogan put a stop to this. Practically nothing of this kind is now done or has been done for 5 or 6 years. On an average, 200 Canadians were deported each year, but the number has now declined until there were in 1900 only 18 deportations. At the present time nearly all of the laborers who come have been thoroughly coached, and those who have been sent back are only those who have actually stated that they are contract laborers living in Canada.

The law does not give power to send back "birds of passage," and in the opinion of the inspector and local labor representatives it should be amended so that such immigrants who come over during the busy season and then return to Canada during the winter can be deported by the inspectors. Such a law would compel them to move into Michigan and to locate and become local consumers. It is claimed that a serious evil is done to the business of Detroit in that so large a number of Canadians, earning their wages on American soil, spend the money they receive on the Canadian side.

At Buffalo the cost of living on the Canadian side is much less than on the American side. A house and garden at Fort Erie or Berthie renting at \$5 or \$6 a month would rent in Buffalo at \$15 or \$16 a month, and rents as cheap as Canadian rents could not be obtained on the American side without going 14 or 15 miles. Quite a number of former Canadians now living in Canada on account of cheapness had lived already on the American side for 5 years in order to obtain their citizenship.

The occupations particularly affected at Buffalo are those of brushmakers, plasterers, lathers, machinists, bricklayers, and stone masons. Carpenters who work for \$1 a day in Canada, whose wages were formerly \$2.50 in Buffalo, are known to have begun work at \$1 per day in order to get a foothold. Employees in the button factory who receive \$3.50 to \$4 per week at Berlin, Ontario, receive \$9 at Buffalo.

The Canadian immigrant at Boston comes by way of steamship from Yarmouth and Halifax, the lines at the present time being the Dominion, the Atlantic Railway and Steamship Company, the Yarmouth Steamship Company, and the Canada Plant Line. In the year ending June 30, 1900, the number of Americans and aliens arriving in Boston from Canadian ports was 26,424, and the number from Europe was

15,754. In the summer of 1900 the steamship rate from Canadian ports, owing to competition, was reduced from \$7.50 to \$1.50, which caused an increase of some 6,000 in the arrivals. The following table shows for the port of Boston the arrivals from Canada of Americans and aliens and also the arrivals from Europe:

Arrivals at Boston from Canadian and European ports from date when service was taken over from Massachusetts State board.

Year ending June 30—	Americans from Canada.	Aliens from Canada.	From Europe.
1894		22,888	17,128
1895		18,635	20,377
1896		19,997	21,846
1897		19,258	13,333
1898	12,239	19,602	12,227
1899	13,710	20,522	19,227
1900	18,070	¹ 26,424	15,754

¹ Rate reduced from \$7.50 to \$1.50 round trip in summer of 1899. Continues same to present time. Competition of Dominion-Atlantic Railway.

Canadian immigration at Boston includes practically the same people every year. They come in the fall to look for work on farms and getting in the crops, and in the spring as fishermen and lumbermen. Also large numbers of carpenters come from Nova Scotia. This is the trade most seriously affected by Canadian immigration in Boston. Many Nova Scotian carpenters have moved to Boston and taken up their permanent residence there. Owing to this Canadian immigration the carpenters' union is the weakest of the building organizations, and the least competent to maintain a scale of wages. The following table presents by months from July, 1899, to March, 1901, the arrivals of Americans and aliens from Canada. It will be seen that the arrivals of Americans (mainly tourists) increased in the months of August and September, while the arrivals of Canadians is largest in the spring and fall, owing to the reasons already stated:

Arrivals at Boston from Canadian ports.

Month.	Americans.	Aliens.
1899—July	1,965	1,689
August	5,155	2,738
September	6,779	6,223
October	1,400	4,026
November	315	1,285
December	250	1,243
1900—January	239	760
February	127	736
March	223	1,819
April	298	2,482
May	351	1,723
June	908	1,709
Total 1899-1900	18,070	26,424
1900—July	3,274	2,276
August	10,398	3,059
September	1,906	3,586
November	584	1,492
December	329	1,311
1901—January	334	971
February	297	712
March	225	1,070

At the railway stations along the New England border complaint is made of the immigration of lumbermen and log drivers. In the report of the Immigration Investigating Commission in 1895, during the industrial depression, it was stated that the annual influx of these men was very disastrous to the wages of American lumbermen and a growing menace to their prosperity. Wages had been greatly reduced during the past 10 years and had reached so low a point as to make it well-nigh impossible for American lumbermen who had families to keep them in the ordinary necessities of life. These lumbermen had usually worked in the States before, and all denied coming in under contract.

Large numbers of women and girls cross at these railway points to work in the factory towns of New England. The influence of this immigration is described in the preceding pages dealing with the textile industry.

CHAPTER IX.

THE FOREIGN IMMIGRANT IN NEW YORK CITY.

[Prepared by KATE HOLLADAY CLAGHORN, Ph. D.]

The problems arising from foreign immigration are especially and peculiarly problems of the large cities. In them the immigrants are first received; in them they settle in large proportions, for longer or shorter periods, if not permanently; and in them the pressure of great masses of population throws into situations of unusual stress and strain the incoming peoples subjected to it.

Of all the great cities, New York may be regarded as perhaps the most intimately concerned with these problems, since of the 19 million and odd foreign immigrants who have come to these shores since the beginning of our immigration records no less than 13½ million, or about 71 per cent, have entered at that port, and no inconsiderable proportion of this large number have remained there.

FIRST PERIOD, 1821-1870.

The immigration problem, usually thought to be a comparatively new one, rendered more critical by the newer races now coming in increasing proportions, was outlined in all its features in the period of British, Irish, and German immigration, and at the very beginning of that period, too.

That first notable influx of immigration which caused the Federal Government to make the first regulations as to passenger traffic on the seas, and to establish the first regular record of alien arrivals, promptly called forth general complaints of the evils of immigration, surprisingly such as we hear them to-day.

The managers of the Society for the Prevention of Pauperism in the City of New York speak thus in 1819:

First, as to the emigrants from foreign countries, the managers are compelled to speak of them in the language of astonishment and apprehension. Through this inlet pauperism threatens us with the most overwhelming consequences. From various causes the city of New York is doomed to be the landing place of a great portion of the European population who are daily flocking to our country for a place of permanent abode. This city is the greatest importing capital of the United States, and a position from which a departure into the interior is generally considered the most easy and practicable. On being possessed of a more extensive and active trade than any other commercial emporium in the Union, it naturally occurs to the minds of emigrants that we possess great means of employment. Our situation is peculiarly healthy, and no local objection, either physical or moral, exists to arrest the approach of foreigners. The present state of Europe contributes in a thousand ways to foster unceasing immigration to the United States. * * * An almost innumerable population beyond the ocean is out of employment, and this has the effect of increasing the usual want of employ. This country is the resort of vast numbers of those needy and wretched beings. Thousands are continually resting their hopes on the refuge which she offers, filled with delusive visions of plenty and luxury. They seize the earliest opportunity to cross the Atlantic and land upon our shores. * * * What has been the destination of this immense accession to our population, and where is it now? Many of these foreigners may have found employment; some may have passed into the interior, but thousands still remain among us. They are frequently found destitute in our streets; they seek employment at our doors; they are found in our almshouse and in our hospitals; they are found at the bar of our criminal tribunals, in our Bridewell, our penitentiary, and our State prison. And we lament to say, that they are too often led by want, by vice, and by habit to form a phalanx of plunder and depredations, rendering our city more liable to increase of crimes and our houses of correction more crowded with convicts and felons.¹

And, curiously enough, at this same time, when population on this great continent was a mere fringe along the Atlantic seaboard, the same anxiety was felt that is felt to-day to get the immigrant out of the "crowded" cities into the country beyond. It was said in 1817:²

We have room enough yet; let them come. * * * But the emigrants should press into the interior. In the present state of the times we seem too thick on the maritime frontier already. Within there is ample and profitable employment for all, in almost any branch of business, and strangers should be encouraged to seek it there.

¹Second Annual Report of the Managers of the Society for the Prevention of Pauperism in the City of New York, 1819.

²Niles's Register, VII, p. 359.

An evil especially felt and directly ascribed to the foreign immigrant was an increase in sickness and the death rate in the city that accompanied the increase in immigration.

The connection between foreign immigration and disease in New York City had been noticed, indeed, before immigration began to be a matter of public record. As far back as 1769 a pesthouse was established in New York, especially "for the reception of diseased emigrants."¹

In 1795, when yellow fever carried off 730 persons in New York City, at least 500 were foreigners, 452 belonging to one Catholic congregation, some of whom had been so short a time in the country that the pastor, Rev. Mr. O'Brien, did not know them.²

The city inspector, in his report for the year 1816, noting the great mortality of the summer of that year, attributes it partly to the excessive heat, but also to the constant influx of immigrants, many of whom were of the poorer class and unaccustomed to the climate.³

In 1834 an epidemic of smallpox broke out, which was accounted for by the introduction of it from abroad "among our poor and filthy population."⁴

By 1837 the connection between immigration and the death rate seemed so important that the city inspector, in his report for the year,⁵ devoted considerable space to an analysis of deaths and causes of death according to place of nativity, showing the especially high proportion of deaths among the foreign born from two great causes—consumption of the lungs and typhoid fever.

From this time on city inspectors call attention again and again to immigration as the cause of disease, and their reports, taking them year after year, in fact show that nearly one-half the deaths by consumption were of the foreign part of the population, and that more than one-third the whole number of deaths were of foreigners.⁶

Commenting upon the death rate of the period from 1846 through the next 10 or 15 years following, the city inspector, in 1860, points out that in 1851-52 there were 1,639 deaths in the city from typhoid fever; in the same years 590,593 aliens landed at the port; that the largest annual number of deaths ever reported in New York from dysentery and diarrhea were during the period of greatest immigration—1847-1855; that, in fact, the rate of mortality from these diseases varied directly with the amount of immigration; and that the largest number of deaths in the city in any one year from smallpox were in the period of greatest immigration.⁷

Much of the disease ascribed to foreign immigration was caused by bad conditions on shipboard during the passage. From the very beginning of immigration to this country—from the time of the early explorers and the original colonists—one who embarked for the voyage across the Atlantic did it at serious risk of his life, not so much from pirates and shipwreck (although these were common perils of the deep) as from disease. Accounts of early voyages show that it was quite a matter of course for a ship to lose from 10 to 30 per cent of her passengers by death from disease on the passage, and to land the remainder in a broken-down and enfeebled condition that unfitted them for some time, if not permanently, for active occupation on shore. The disease most common on these voyages was the typhus, "jail" or "ship" fever, the latter familiar title showing how closely the disease was associated with the ocean crossing, and was due to the neglect by shipmasters of the most rudimentary sanitary requirements, of failure to provide for ventilation, cleanliness, and wholesome or sufficient food. And so when immigration was heavy, typhus fever appeared on the voyage as a natural consequence. The severe outbreaks of this disease at the time of the great outpouring in the late forties were partly ascribed to the miserable condition of the emigrants when they left home, but largely to the crowding and bad ventilation of vessels and to the insufficient supply of food provided for passengers. At this time it was said that "scarcely a vessel has arrived with Irish emigrants without having the disease prevailing on board, and in some instances as many as 40 or 50 have died on the vessel, and more than 100 sick have been landed at quarantine from one vessel. Hundreds, too, who have passed the inspection of the health officers and been permitted to land, come up to the city having the seeds of disease already implanted, have sickened within from 1 to 3 weeks, and being frequently kept in town by their friends, contributed to spread the disease and infect the localities in which they sojourned."⁸

These bad conditions led to various United States regulations dealing with passenger traffic, and in 1847 a bureau of immigration was established by the State of

New York to provide against sanitary and other evils arising from immigration, but the death rate from diseases caused among immigrants by the passage over continued high.

In 1853 Asiatic cholera broke out in immigrant vessels, and led to demands for further United States legislation to remedy such causes as could "be traced to any state of things on shipboard, such as defective ventilation, bad or insufficient food, or too large a number of passengers crowded together."¹

Such legislation was enacted in 1855, providing for a limitation of passengers carried, by the tonnage of the vessel—1 passenger being allowed for every 2 tons—providing for space, for ventilation, for stated supplies of food and water to passengers, for cleanliness, and for inspection at the ports to see if all conditions were complied with.

This act seemed to be more effectual, and by 1858 it was said that the sanitary condition of the immigrants had greatly improved,² while by 1864 it could be said that the diseases engendered by "confined air, filthy habits, bad fare, and long voyages," which at one period filled the hospitals with the sick and dying, had been so reduced as no longer to be a source of serious apprehension.³

Other circumstances than those of the ocean crossing were, however, responsible for the connection made in the public mind between the foreign immigrant and the city's high death rate.

The general situation as regards the health of the city and the foreign-born population at this time was summed up by Dr. John H. Griscom in his report as city inspector in 1842 as follows:

It will not, it is presumed, be disputed that New York contains a larger proportion of inhabitants of foreign birth than any city in the United States, and this fact assumes, in connection with the mortality of the city, especially with the disease under consideration (consumption), a vital importance as affecting its sanitary reputation.

Here are congregated armies of foreigners drawn from their homes by various causes, and mostly in search of a living, allured by the flattering expectations held out to them of a "free country." They bring with them destitution, misery, and too often disease already taken root. If in good health when living at home, the suffering, privation, and close confinement incidental to the voyage rarely fail to engender disease, especially fevers and diseases of the lungs, from the effects of which they frequently never recover, and their broken constitutions are thus rendered a fertile soil for the germination of seeds of new diseases which future circumstances may plant. Ostracised, they soon experience the depressing effects of being strangers in a strange land. Ignorant of where to look for a support, thousands are cast upon charity for a meager and uncertain subsistence. Living in crowded apartments, in crumbling tenements, and narrow streets, and upon food poor in quality and stinted in quantity, they are peculiarly exposed to inroads of disease.⁴

And later in the report Dr. Griscom announces it as his conclusion that "the first among the more serious causes of diseased general health * * * is the crowded condition, with insufficient ventilation, of a great number of the dwellings of this city."⁵

It is difficult to trace the immigrant to his first dwellings in this city. Enough is known, however, of the general growth of the city to give opportunity for a tolerably close guess as to where he went and what quarters he had.

By the close of the eighteenth century the city was growing rapidly toward the north, streets were being raised and paved, and the dock frontage extended further into the water. The docks in process of construction became gathering places of all sorts of filth, forming about the city a belt of offensiveness along the river front from which, it may be supposed, the well-to-do were ready to draw back. In the neighborhood of the docks were a large number of old wooden houses, many of which, built before the raising and paving of the streets, had their lower floors 2 or 3 feet below the surface of the pavements.⁶ This was particularly the case at the southern end of the island, in the First, Second, and Fourth wards; but in other quarters, too, other offensive neighborhoods had grown up.

In such neighborhoods disease flourished. The outbreak of yellow fever in 1795 "prevailed on the borders of the East River, in the low streets and what was formerly the swamp, and in the narrow alleys."⁷ And in such neighborhoods, evidently, the immigrant population found their first homes; for it will be remembered that it was in this epidemic that so large a proportion—500 out of 730—of the victims were immigrants, most of them newly arrived.

By 1820 a cellar population had come into existence in New York, as we know by accounts of a malignant fever that broke out in Banker street, all cases of which were noted to be of residents in cellars. These, however, were negroes, not foreign immigrants.

⁶ Dr. John H. Griscom, History of Yellow Fever, p. 8.

⁷ Dr. John H. Griscom, History of Yellow Fever, p. 7.

The yellow-fever epidemic of 1822 drove the well-to-do population uptown to "Greenwich Village," and shortly after that time the growth of the city was so great that builders were taxed to their utmost to provide houses for all who wanted them.

The business district was growing to the north, with Broadway as its main axis, and in the course of this growth, well-to-do residents of the neighborhoods encroached upon moved still farther to the north, leaving their substantial dwellings to be occupied by the poor, who found it desirable to remain near the business district that afforded them a livelihood, and who, to save expense, crowded themselves 4, 5, or 6 families together into a structure adapted to the uses of one family only. And "the poor," as years went on, were more and more exclusively the foreign born and their children.

By 1834 overcrowding was recognized as a serious evil. Gerrett Forbes, city inspector for that year, says that, together with intemperance, the most prominent cause of the increase of deaths over the increase of the population which he has noted, is "the crowded and filthy state in which a great portion of our population live and apparently without being sensible of their condition."

Former good residence districts that were gradually being changed into crowded quarters of the poor were, notably, along the west side, up toward Greenwich Village, and in the center of the city, the old Fourth Ward, with its many fine old mansions.

North of the city hall, and to the east of Broadway, a neighborhood of evil notoriety had come into being by a somewhat different order of growth from that described above—in the famous Sixth Ward and its little less notorious neighbor on the north, the Fourteenth.

The Sixth Ward was never as good a residence district as some others in the city on account of its peculiar topography. The "Collect," a deep pond in a deep basin, covered a considerable portion of its surface, and while, in its natural state the pond added to the attractiveness of the locality, in 1800 the city began to fill it in, and from that time to 1810, when the work was finished, the spot was a center of offense and filth. The place was made a common dumping ground for garbage, dead animals, and all sorts of trash; a circumstance that would naturally hinder the development of the neighborhood as a good residence district. On the high land above this pond some good houses were probably erected; and an old print showing the "Five Points" in 1827 represents some good and substantial looking dwellings. But a large number of the houses erected in this quarter were shacking frame structures, built on made land; and the famous tenement streets about the "Five Points"—Baxter, Park, and Mulberry—were laid out over the very site of the pond, or along its edges.

By 1830 the Sixth Ward had become notorious for crime and disorder, and by 1834-35 it emerges into especial publicity as a long-settled Irish neighborhood, in the course of the Irish riots that marked those years and that had their center here.

In this ward an epidemic of "continued fever" (typhoid) broke out in 1837. A physician, describing this epidemic, said that the cases occurred in the midst of a poor population, "principally Irish and German, whose habits * * * are more or less filthy, and who lived crowded together, with a family in every room in the house, and sometimes more."¹ All cases occurred west of the Bowery, where there was far greater crowding than to the east of that street, and all occurred in base ment dwellings, or first floors with no basement or cellar beneath.

A month or two before the outbreak of this epidemic the mayor of the city, Aaron Clark, writing to the common council, on June 5, in regard to the disease likely to be occasioned by immigrants, said that "if they have it not with them on arrival they may generate a plague by collecting in crowds in small tenements and foul hovels."²

His prognostication was fulfilled, it is seen, within a very brief period. In the summer of 1842 a number of cases of typhus fever of a severe type occurred in a building in the rear of No. 49 Elizabeth street, in the Sixth Ward, "under circumstances," said the physician reporting on the cases, "which left no doubt of its local origin."³ The picture he gives of the surroundings of these cases shows us the general features of a housing system for the poor that had developed itself by this time:

The front building, a small two-story frame house, was partly occupied by the proprietor or lessee of the building as a liquor store and partly sublet to several Irish families. A covered alleyway led to the rear building. This was a double frame house 3 stories in height. It stood in the center of the yard, ranged next the fence, where a number of pigsties and stables had surrounded the yard on 3 sides. From the quantity of filth, liquid and otherwise, thus caused, the ground, I suppose, had been rendered almost impassable, and to remedy this the yard had been completely boarded over so

¹ Dr. John H. Griscom, *Sanitary Condition of the Laboring Population*, 1845, p. 15.

² Sanderson, *Republican Landmarks*.

³ Dr. J. H. Griscom, *Sanitary Condition of the Laboring Population*, p. 18.

that the earth could nowhere be seen. These boards were partially decayed, and by a little pressure, even in dry weather, a thick, greenish fluid could be forced up through their crevices. The central building was inhabited partly by negroes. In this building there occurred in the course of 6 weeks 9 cases of typhus fever. * * * At my solicitation the alderman of the ward visited the building, the number of pigs about the establishment was reduced to that allowed by law, and chloride of lime, whitewashing, etc., liberally and assiduously employed.

In this example is seen the original "tenement house"—the old-fashioned frame house, once occupied by one family, and now turned over to occupancy by many. In the rear of this, to occupy a part—probably a large part—of the original yard, had been built up a big barrack, expressly for tenement uses. In this a new stage in the development of the tenement-house system is seen. Such barracks were not necessarily erected on lots already occupied along the street line by older buildings, but they were in many cases. Nor was the rear tenement always a barrack building. It was often the original building on the lot—perhaps a one or two story frame shanty, in front of which was erected a barrack building. Sometimes, too, the rear buildings were irregular little frame structures run up in the rear of the lot to fill the space left by a front tenement. But in any case the "rear" tenement was, as a rule, less desirable than the front tenement, and, as in this example, was frequently given over to a different and inferior—that is, less prosperous—race than that which occupied the front tenement. This, too, is a typical feature of the tenement system as it developed. And it will be noticed that the whole tenement was leased and controlled by one man, who sublet the separate apartments occupied by the many families filling the tenements. All of these features played an important part of their own in the development of the tenement system.

The earlier type of tenement house—the old made-over family residence—was responsible for the beginnings of a great "cellar population," whose wretchedness was a continual tax upon the sympathies and conscience of the well-to-do, through a long series of years. The conditions under which they lived are almost incredible to-day. Dr. Griscom says, in 1845:

The most offensive of all places of residence are the cellars. It is almost impossible, when contemplating the circumstances and conditions of the poor beings who inhabit these holes, to maintain the proper degree of calmness requisite for a thorough inspection of their miseries, and sound judgment respecting them. You must descend to them; you must feel the blast of foul air as it meets your face on opening the door; you must grope in the dark or hesitate until your eye becomes accustomed to the gloomy place, to enable you to find your way through the entry over the broken floor, the boards of which are protected from your tread by a half inch of hard dirt; you must inhale the suffocating vapor of the heated rooms; and in the dark, dim recesses endeavor to find the inmates by the sound of their voices, or chance to see their figures moving between you and the flickering light of a window, coated with dirt and festooned with cobwebs—or, if in search of an invalid, take care that you do not fall full length upon the bed with her, by stumbling against the bundle of rags and straw dignified by that name, lying upon the floor, under the window, if window there is; and all this and much more beyond the reach of my pen must be felt and seen ere you can appreciate in its full force the mournful and disgusting condition in which thousands of the subjects of our Government pass their lives.¹

The use of cellars, begun in the old single-family residence, occupied by many families, was continued in the tenement house proper; but as the big barracks were built in greater and greater number until the call for houses was more adequately met without recourse to underground apartments, the cellar residences decreased.

From the specially constructed tenement house, placed on the front or rear of the lot, came the "courts" and "alleys" in which tenement houses were crowded upon every available foot of spare ground.

The city inspector, in his report for 1845, said that in comparison with the older type of dwellings, with their crowded cellar apartments, the new "courts" were "luxurious and economical residences." But Dr. Griscom, in his report for 1842, had joined the "courts" with the cellars in their harmful influences upon public health.

These, indeed, were largely responsible for that part of the high death rate among the foreign born which was caused by consumption, as the immigrant ships had been largely responsible for that part caused by typhus. Dr. Griscom says:

The annual reports of the city inspector show that nearly one-half the deaths by consumption are of the foreign part of the population, and that more than one-third the whole number of deaths are of foreigners. Such an immense disproportion can only be accounted for on the supposition that some extraordinary causes of death prevail among the strangers who come to reside among us. Now it is a pretty well ascertained fact that a large majority of the cellar and court population of this city consists of persons of foreign birth and their children; of the dispensary patients about 60 per cent are natives of other countries, and if it were possible to ascertain the parentage of the children receiving aid from these institutions we should find a larger proportion than this directly dependent upon foreigners. There is no doubt that 75 per cent of them are either emigrants or the children of such. Put these facts side by side, then, and we are confirmed in the conclusion that the domiciliary condition of these poor beings, the confined places in which they dwell, the unwholesome air they breathe, and their filth and degradation, are prolific sources of an immense amount of distress and sickness, which in their turn serve by the loss of time, of wages, and of strength, to aggravate the miseries of their condition, to increase the danger to the public health and the burden of public and private charity.²

¹ Sanitary Condition of the Laboring Population, pp. 8-9.

² Sanitary Condition of the Laboring Population, p. 14.

Further testimony is given to show that it was not so much the original condition of the immigrant as the wretched dwelling he had to live in that caused the high rate of sickness and death among foreigners in the city.

The city inspector says in his report for 1860:

The further fact should be adduced that most of the children who arrive in this city from foreign ports, although suffering from the effects of a protracted voyage, bad accommodations, and worse fare, do not bring with them any marked disease beyond those which, with proper care, nursing, and wholesome air, could not be easily overcome. The causes, then, of this excessive mortality must be sought for in this city, and are readily traceable to the wretched habitations in which parents and children are forced to take up their abode; in the contracted alleys; the underground, murky, and pestilential cellars; the tenement house, with its hundreds of occupants, where each cooks, eats, and sleeps in a single room without light or ventilation, surrounded with filth, in an atmosphere foul, fetid, and deadly, with none to console with or advise, or to apply to for relief when disease invades them.¹

Immigration was somewhat checked during the war, but even under those circumstances house building in the city did not keep pace with the population, and the close packing of tenants in confined quarters still brought "disease, demoralization, and death" as their consequences.²

Conditions were so bad that in 1864 leading citizens of New York formed themselves into a "citizens' association," for the purpose of investigating and reforming the prevailing evils. A subcommittee, known as the "council of hygiene and public health," undertook a thorough sanitary investigation of the city, and their report affords us one of the most valuable studies of city conditions and a city population that has ever been prepared.

The committee found, as to the tenement system in general, that the—

tenant houses of this city are unlike the habitations occupied by the poorer classes in any other city, principally in the following respects:

1. That the occupants have less personal interest in and control over the character, cleanliness, and surroundings of their domiciles than is usual in other cities.
2. That the rate of crowding, both as regards the allowance of area and of air space to each person, far exceeds the ordinary degrees of aggregation of the poorer classes in other cities.
3. There is less concern and expenditure for the welfare of the tenants, and at the same time a higher rate of rental for domiciles, than prevails in other cities.
4. There is relatively, as well as numerically, a vastly larger population dwelling in crowded tenant houses in New York than in any other great city.³

The total population of New York had doubled in 20 years, and the great majority of it—the laboring and poor classes—had "become more and more concentrated upon given areas and in particular streets and districts." In a sanitary survey of the city by the council, completed in December, 1864, it was found that the total number of tenant houses was 15,309, and the average number of families to each was $7\frac{1}{2}$. The number of persons residing in tenant houses and cellars was 495,592, to which should be added those in smaller habitations, attics, stable lofts, etc., where insufficient area and air space were found.⁴

At this time the tenant houses of the city were nearly all found within an area of 4 square miles, and certain parts of the city showed a density of population greater than that of any parts or wards of London or any other European city.

As compared with tenements of former times, those of this period were built to a greater height in stories, there were more rear tenant houses erected back to back with other buildings correspondingly situated on parallel streets, and courts and alleys were more encroached upon and narrowed into unventilated, unlighted, and well-like holes between front and rear tenements.⁵

The accompanying table shows the distribution of the tenant-house population throughout New York at this time, and gives some idea of the relative proportion of tenement-house dwellers to the total population. It must be noticed, however, that the total population given in the table is that for 1860, while the tenant-house population is that of 1864. Consequently the proportion of tenant-house dwellers to total population based on these figures would be somewhat too high. As the population increased only about 16 per cent in the whole decade from 1860 to 1870, however, the disproportion is not so great as it might be.

22	61,725	32,544	996	31,845	32	7,714	7

About this time it was observed not only that poor people were concentrated in certain districts, but that they were more or less segregated according to nationalities. And in 1867 it was noted that the social relations of the foreign to the native population had materially changed; that the foreigners no longer blended with the native stocks to become incorporated with them.¹

"So large are the aggregations of different foreign nationalities," the report goes on to say, "that they no longer conform to our habits, opinions, and manners, but, on the contrary, create for themselves distinct communities, almost as impervious to American sentiments and influences as are the inhabitants of Dublin or Hamburg. . . . They have their own theaters, recreations, amusements, military and national organizations, to a great extent their own schools, churches, and trade unions; their own newspapers and periodical literature."

These foreigners had at that time in the city 73 churches of their own, 35 newspapers in 5 languages, and many charitable institutions for the benefit of their own people.

The Report of the Council of Hygiene, above referred to, shows more or less in detail how these foreign populations were distributed in 1864.

Beginning at the lower end of the city, where the immigrant first enters it after landing at the immigrant station, it is found that the lower west side, one of the good residential districts mentioned in describing an earlier period, had been wholly converted to a tenement district of peculiar offensiveness.

The inhabitants of the district were largely of foreign birth; about one-half the population were Irish, about one-fourth Germans, the remainder were Americans, Swedes, and Danes. About two-thirds of the population were laborers and mechanics with their families; the remainder were retail shopkeepers and keepers of hotels and sailors' and immigrants' boarding houses. A large element of the population was a floating one, consisting of travelers, immigrants, sailors, and "vagrants without a habitation and almost without a name."²

Many of the tenement houses in this district were the old family residences of a more prosperous time, but many were the big brick barracks built especially for tenement uses; the former mainly along Greenwich street, the latter mainly along Washington street, which, being made ground, had not been built up as Greenwich street was, with buildings of the better class, thus affording opportunities for erecting this other class of buildings.

A marked feature of tenement conditions here was the small size of the apartments, which insured overcrowding.

Throughout all these quarters the utmost neglect of all hygiene laws prevailed. Typhus fever and measles prevailed here, and proved very fatal; and a list of cases

¹ Report A. I. C. P., 1867, p. 42.² Report Council of Hygiene, p. 5.

under the care of the principal charitable society of the city, giving names and addresses, shows that this region was a veritable nest of pauperism.

Following up the west side from Reade street to Fourteenth, different stages of the general process of change characteristic of a great city's growth are to be seen. In the district already described the change was almost complete; as one passed northward, the change was seen in less and less advanced stages.

From Reade to Canal street the greater number of residents were of foreign parentage. The colored population, once very numerous, had almost disappeared. The houses of prostitution—the fringe that an advancing fashionable quarter drags behind it—for which the neighborhood had once been famous, were rapidly disappearing, the former occupants of these houses being replaced by foreigners, who in turn were being crowded out by the growth of the business district.¹

From Canal to Spring street, west of Broadway—a district containing the lower ends of Thompson, Sullivan, Wooster, and Greene streets, of malodorous memory—the inhabitants were about equally divided into Americans, foreigners, and negroes. The majority of the retail stores were kept by foreigners, who were said to be “an industrious and hard-working people.”² The Americans were well to do, living in their own homes, while the negroes were a poor, lazy class. Houses of ill fame were more numerous here, where the change had not proceeded so far, and the inmates were “composed of nearly all nationalities, not excepting our own.”³ Thieves, pickpockets, and gamblers abounded.

From Spring street to Houston, Irish and Germans comprised a large part of the inhabitants. A few negroes were found here, and many houses of prostitution of the better class, as the district was in the vicinity of the great hotels and the places of public amusement. From Houston street to Christopher street, the inhabitants were mostly of the laboring classes, presumably with a large foreign intermixture.

Between Christopher street and Fourteenth, lay the former “Greenwich Village,” and here we catch up with the native born on their journey northward. The population of this district contained, in 1864, probably a larger proportion of native-born residents than any in the city, with the exception of the Fifteenth Ward. Few wealthy families were found here; most of the inhabitants were tradespeople, clerks, mechanics of the better class, and cartmen.

The tenant houses throughout the district from Reade to Fourteenth street were mainly 2 to 4 story brick dwellings, from 20 to 40 years old, built for one family.

There were, besides, some of the small, rickety, old frame dwellings, of the type already noted in the Sixth Ward, and a few of the barrack type, mostly in very bad condition. Rear tenements of the lowest grade were to be found in considerable numbers.

From Fourteenth to Fortieth street, the foreign population is seen to have entered the district side by side with the native population in a very literal sense. Passing over Greenwich Village, they had traveled up the western edge of the district above as the native born were traveling up its eastern edge—the center of the island; and, as the foreigners were now coming into a region not already thickly built up, the brick barrack was the prevailing type of tenant house. Here then grew up the characteristic “barrack” evils and here were to be found some of the worst and most extreme types of that class of buildings.

The inspector for the district between Twenty-sixth and Thirty-third streets describes a square almost covered with front and rear tenements, and depicts vividly the terrible sanitary conditions that naturally arise, from lack of ventilation and sanitary conveniences.

He says:

In a majority of rear tenements * * * the apartments are dirty, dark, and uninviting, often reeking with filth, the walls wholly innocent of whitewash, and the atmosphere impregnated with the disagreeable odor so peculiar to tenant houses. In some the sun never shines, and the apartments are so dark that unless seated near the window it is impossible to read ordinary type; and yet the inspector often hears the hackneyed expression, “We have no sickness, thank God,” uttered by those whose sunken eyes, pale cheeks, and colorless lips speak more eloquently than words of the anemic condition inevitably resulting from the absence of pure, fresh air and the general light of the sun. * * * The tenants seem to wholly disregard personal cleanliness, if not the very first principles of decency, their general appearance and actions corresponding with their wretched abodes. * * * This indifference to personal and domestic cleanliness is doubtless acquired from a long familiarity with the loathsome surroundings, wholly at variance with all moral or social improvement, as well as the first principles of hygienic science.⁴

The foreign residents of this district were mostly Irish, with a few colored people intermingled.

Going still farther to the north, above Fortieth street, still another phase of foreign life in the city is seen. By this time the foreign population had fairly outrun the native population, and throughout the sparsely settled district of the upper west side, on the broadly stretching vacant lots through which the streets of

¹ Report Council Hyg., p. 25.

² Report Council Hyg., p. 37.

³ Report Council Hyg., p. 245.

a later time had not yet been cut, on the miniature crags and peaks that dotted the ground a foreign squatter population had erected its dwellings.

In the New York Times of November 21, 1864, it was said that there was then—

A population of 20,000 on this island that pay neither rent for the dwellings they occupy nor municipal taxes as holders of real estate. They comprise that portion of the population known as "squatters." In one ward, which we need not name, they combined a year or two ago in sufficient numbers to control the election for alderman and councilmen. We are not altogether sure that they can not control the majority of votes in the same ward to-day.

These 20,000 exempts [says the inspector of the council of hygiene, who gave in his report the above extract from the Times] exercise, by favor of the common council, the right of free pasture for cows and pigs. The public pound has been voted a nuisance; the keepers thereof a double-distilled nuisance. * * * The "freedom of the city" they hold to embrace * * * likewise the right of revising the general municipal surveys. * * * The dwellings of the "exempt" population at frequent intervals hold possession of the public highway. At sundry points they take half the carriage road, the owners no doubt holding to the view that where a dung cart can pass along there is ample accommodation for any other species of vehicle.¹

The squatters' dwellings, which were scattered irregularly around without reference to lot or to street boundaries, were the "shanties" so familiar to an earlier generation of New Yorkers.

The shanty [says an inspector of the council of hygiene] is the cheapest and simplest domicile constructed in civilized communities. The typical shanty is built of rough boards, which form the floor, the sides, and the roof. It is built either on the ground or but little raised above it. It is from 6 to 10 feet high, and its ground area varies much in different cases, but is always of moderate extent. It contains no fireplace or chimney, but a stove, the pipe from which passes through a hole in the roof. It has from 1 to 3 or 4 windows, with single sash, each containing from 4 to 6 panes of small size. Some shanties have but 1 room, others an additional small apartment, used as a bedroom. The better shanties are lathed and plastered. It is evident that to the occupants of the shanty domiciliary and personal cleanliness is almost impossible. In one room are found the family, chairs, usually dirty and broken, cooking utensils, stove, often a bed, a dog or cat, and sometimes more or less poultry. On the outside, by the door in many cases, are pigs and goats and additional poultry. There is no sink or drainage, and the slops are thrown upon the ground.²

It is seen, then, that the shanty could be about as filthy as the tenant house proper, but this advantage, at least, it had over the latter—it housed, usually, only one family, and, standing free on three sides at least, admitted much more fresh air and sunlight.

The shanty population of the upper west side was, in contrast to the lower west side population, largely composed of Germans; but many Irish were found here also. Many were day laborers, employed by contractors in grading, paving, and sewerage of the streets, and in the removal of rock, or in excavating for public purposes. Some were employed in the stables of the city railroads and stage companies, or in Central Park.

In this district, there were also some brick and wooden tenements, inhabited by mechanics, by drivers and conductors on the city railroads, and by many of those engaged in retail business on the avenues. In the wooden tenements German families preponderated; in the brick, Americans.³

Having traced the progress of the foreign population up the west side, we may return to the lower part of the city.

In 1864 the Fourth Ward could show some of the worst types of the tenement houses in the city. Many of the old residences had been torn down and replaced by the big tenement barracks. One of the most notorious of these, known as "Gotham court" in Cherry street, was 34 feet wide in front and rear, 234 feet long, and 5 stories high. This immense block had at one of the long sides a clear space of 9 feet separating it from a similar structure forming part of the "court;" on the other side a clear space of 7 feet divided it from the rear of the houses on Roosevelt street. Hemmed in, in this way, the "court" could receive the smallest modicum of light and air, and disease was bred here freely. This house represented about the average sanitary condition of the tenement houses in the district, although from its size it was the most notorious among them.

The inhabitants in this district, on Oak, Cherry, and Water streets, on Oliver, James, and Roosevelt, were mainly Irish of the lowest and most degraded class.

The Sixth Ward at this time could lay claim to the most exclusively foreign population of any district in the city. Americans constituted less than 5 per cent of the whole number. Of the foreign population, the Irish constituted 74 per cent; the remaining 26 per cent were mainly German Jews and Italians. The German Jews dealt in old clothing and made Baxter street their headquarters; the Irish kept junk shops, liquor stores, groceries, etc.; the Italians were ragpickers, and organ grinders.⁴ By this time about one-third of the tenement houses in the ward were of the "barrack" type, containing from 10 to 50 families each. The remainder were very old wooden structures, some quite small, containing 4 to 8 families in as many rooms. Many of these houses were used as lodging houses, as many as 30 persons being packed into a single room.

¹ Report Council Hyg., p. 293.

² Report Council Hyg., p. 300.

³ Report Council Hyg., p. 303.

⁴ Report Council Hyg., p. 77.

In the Fourteenth Ward, just to the north, one-half of the inhabitants were of the lower orders, mostly Irish and Germans, the former nationality predominating. Here also were to be found the old wooden houses used as tenant houses, and the new brick barracks.

At Houston street, the northern boundary of the Fourteenth Ward, the tenement district of the central part of the city may be said to have ended at this time, the ward above, the Fifteenth, containing a population almost entirely native born and comparatively few tenant houses.

To see the remainder of the tenement-house population we must now turn to the east side.

The Seventh Ward, lying along the East River, and formerly a good residence neighborhood, largely settled by Quakers, was by this time changing to a tenement district. A few of the former well-to-do residents still lived in the central portion, but the population was now made up principally of mechanics, longshoremen, and sailors. In the eastern part of the ward were many crowded tenement houses of the newer type, but most of the tenement population lived in old-fashioned 2 or 3 story dwelling houses, not built for tenements. The population here was mainly Irish, with a sprinkling of other nationalities among the sailors and longshoremen.

The Tenth Ward, just to the north of the Seventh Ward, was at this time the one distinctively and exclusively German district in the city. Here this people had rushed in such numbers as to make it profitable for landlords to erect many new tenement houses, and fewer of the old, dilapidated houses were to be found here than in other quarters. The new tenant houses were said to be of pretty good character.

The Thirteenth Ward, to the east of the Tenth Ward, was densely crowded with the working classes, the majority of whom were Irish; Germans ranked next, and Americans last. Only one-fourth of the buildings were tenant houses. The ward showed a high rate of sickness and mortality, owing to the overcrowded and ill-ventilated dwellings and to the ignorant and careless habits of the people themselves.

To the north, from Rivington to Fourteenth street, in the Seventeenth and Eleventh wards, a German population was pressing in, rather more numerously in the part of the district adjoining the Tenth Ward northward to Seventh street and eastward to First avenue. East and north of here the Irish prevailed. The densely crowded Eleventh Ward contained probably a larger artisan population than any other district in the city. In the whole district old and new tenements were mingled and conditions were bad.

On the upper east side, as in the upper west side, well-to-do native residents were found toward the center of the city, while poor foreigners were found in the streets nearer the river. From Fourteenth to Fortieth street the foreign population was mainly Irish or of Irish descent, packed in filthy tenements and of the most unclean and degraded personal habits.

Above Fortieth street squatter colonies, similar to those on the west side, were found, made up of Irish and Germans, and one is noted as far down as Thirty-ninth street and First avenue, where a slight eminence known as "Hutch Hill" sheltered the colony, and by its name indicated their nationality.

It will be observed from this general survey that the Irish were scattered pretty well over the city, while the Germans were largely packed into one or two crowded wards, where they formed a dense settlement of their own nationality, or were to be found in colonies among the squatter population; that in general the Irish were to be found rather more frequently on the west side, the Germans on the east.

Next to be considered are the social and moral aspects of the life of the foreign population thus widely distributed over the city. The tenement houses in which most of them found their homes were certainly little calculated to develop high social and moral types, and indeed brought to bear influences working directly the other way.

Physical devitalization led to moral degeneracy. The general lowering of vitality due to the foul air, darkness, and filth of the tenement is accompanied by a depression of spirits, a reduction of energy and ambition. The tenement dweller is not only incapacitated for work, but loses interest in it and in the progress of his family; resorts to strong drink to stimulate his system, while this in turn reduces his physical health still further and incites him directly to all kinds of vice and crime.

The state of physical and moral degradation brought about in the tenement house became so distinct a type that all observers and investigators remarked it, and some, one of them in a flash of genius bestowed upon it the significant, if not elegant, name of "Tenant-house rot."

Dr. Griscom, as early as 1842, had called attention to the "depraved effects which such modes of life exert upon the moral feelings and habits;"¹ and the city inspector in 1851 remarks that "these overpopulated houses are generally, if not always, seminaries of filthiness, indecency, and lawlessness."²

¹ Annual Report of Interments, New York, 1842, p. 161.

² Annual Report of Interments, New York, 1851.

Overcrowding of itself led to grave evils; and the whole set of influences at work in the tenement were well summed up by the well-known philanthropist, Mr. Charles L. Brace:

In many quarters of the city family life and the feeling of home are almost unknown; people live in great caravansaries, which are hot and stifling in summer, disagreeable in winter, and where children associate together in the worst way. In many rooms privacy and purity are unattainable, and young girls grow up accustomed to immodesty from their earliest years. Boys herd together in gangs, and learn the practices of crime and vice before they are out of childhood. Even the laborers' families who occupy separate rooms in these buildings have no sense of home. They do not own the house nor any part of it, nor have any interest in it. All that valuable industry which in the country a mechanic or laborer applies in odd hours to his little homestead is here lost. The workman spends his leisure hours in the grogshops or at the corner groceries. The general effect of the system is the existence of a proletarian class, who have no interest in the permanent well-being of the community, who have no sense of home, and who live without any deep root in the soil, the mere tools of demagogues and designing men.¹

For the existence of the tenement houses themselves, with all their evil influences, the immigrant, the landlord, and the city have to share the responsibility. It is plainly evident that the tenement houses were called into being by the heavy demands for housing made by the constant inpouring of great masses of immigrants, and overcrowding seemed to be an almost inevitable result of this demand, as the immigrants were very poor and land was dear in the city itself, while transportation facilities were not as yet so developed as to permit the city laborer to live in suburban districts where land was cheaper.

But the landlords were especially to blame for the ill consequences arising from the tenement houses, as they were, obviously, the ones who decided in what way and with habitations of what character the immigrants' demand for housing should be met. The immigrant himself was in no position to dictate terms. Poor, ignorant of the country, and with immediate need of shelter, he had to take what was provided for him by the landlord. And the landlord took the utmost advantage of the situation by charging the highest possible prices for the poorest possible accommodations, and disregarding every law of health and decency in erecting the big barracks meant for occupation by the poor.

Successive investigations of the housing system in New York agreed in showing the "greedy and mercenary landlord," rather than the helpless tenant, as the primary cause of tenement evils.

An inspector for the council of hygiene in 1864 thus reports the landlords' methods, with regard to repairs:

Every expenditure of money which the law does not force them to is refused; and blinds half sprung and ready to fall and crash with the first strong wind; doors long off their hinges, which open and shut by being taken up bodily and put out of or in the way; chimneys as apt to conduct the smoke into the room as out of it; stagnant, seething, overflowing privies, left uncleansed through the hot months of summer, though pestilence itself should breed from them; hydrants out of repair and flooding sink and entry; stairs which shake and quiver with every step as you ascend them; and all this day after day, month after month, year in and year out.

But the city, too, must bear a considerable share of the blame for bad tenement conditions, from its neglect to protect the community by adequate legislation against the consequences arising from the greed of landlords and the ignorance and poverty of tenants at a time when, in the first beginnings of the tenement system, legislation could easily have prevented evils which, once having come into being and become vested interests, it could not cure.

In considering the problem of immigration in New York City, another factor, however, has to be taken into consideration besides those already mentioned, namely, the especial characters of the different races represented in our immigration.

The Irish came among us in especially poor physical condition, owing to their miseries and misfortunes at home. This was particularly true of the immigration of the forties and fifties, which spread our tenement-house population beyond its former somewhat narrow quarters, throughout the extent of the city.

One reason why the Irish tenant would submit to crowding in the cities was because he was used to it at home. An architect, writing to the Irish Builder, says:

The man or woman born in a cabin or garret will much prefer spending their lives in one room with their family, no matter how numerous, to the trouble of adjourning to separate apartments, unless, as I said before, example teaches them better, which is one great advantage in gregarious dwellings. I have seen in Ireland a horse, 2 cows, 2 goats, grandmother, father and mother, brothers and sisters, an infant in a cradle, all in one apartment. There was an inner room with 2 bedsteads, one answered as a standing for firkins of butter, the other for seed potatoes. This was in many places in county Cork, and in Erris and Tyrarley. The late Lord George Hill, in his book *Facts from Gweedore*, mentioned the great difficulty he had in getting the tenantry to give up this gregarious method of living, and at night when the door of the house was shut the effects from want of ventilation on the health of all, man and beast, must be injurious. The disease known as the "head fall," which all but depopulated Tory Island, on the coast of Donegal, about 20 years ago, has been, not without some reason, ascribed to this cause.²

¹ Report A. I. C. P., 1878, p. 33.

² Report A. I. C. P., 1879, p. 53.

While all the foreign population showed a high sickness and death rate in New York City, that for the Irish was exceptionally high in comparison with other peoples, whether from their originally debilitated condition or from their exceptionally intemperate habits or from other causes.

Pauperism, it may be remembered, was the principal evil spoken of in that first complaint against immigration in 1819, which has already been quoted, and at that time the great mass of the paupers were Irish, as indeed has been the case ever since.

Most of the assisted paupers about whom so much complaint was made in the first half of the century just past, were from British and Irish almshouses; and as the Irish immigration was so much larger than the English, the Irish paupers were the most noticeable in their effect upon prevailing conditions. Besides the actual almshouse paupers there was a large class of Irish who, living at home such a hand-to-mouth existence, by irregular and ill-paid employment, were at any moment liable to slip from this precarious footing on the very verge of pauperism into pauperism itself, at any little circumstance of change or misfortune. Such a change did emigration prove to many of them, and the New York almshouses were filled with Irish paupers. It seemed, indeed, as if the burden of pauperism in New York had been transferred directly from Ireland, relieving that country in exact proportion to our additional load. It was pointed out that while the State of New York gave public aid to 346,518 persons in 1856, Ireland, with about double the population, in the same year gave relief to only 304,000 persons, and that the poor rates there were rapidly decreasing.¹

Reports of the private charitable societies and public institutions show, in conclusive detail, the disproportionately high rate of pauperism shown by the Irish as contrasted with other nationalities.

It was noted in 1860 that—

The almshouse returns show that about 86 per cent of the persons relieved by charitable aid are of foreign birth, of which 69 per cent were Irish and about 10 per cent German, or nearly 7 Irish to 1 German. As the Irish population, however, is nearly twice that of the German, the actual ratio is about 2½ Irish to 1 German, and 5 Irish to 1 American.²

In chronic pauperism, as contrasted with that temporary condition of want requiring relief into which any immigrant might fall while going through the process of industrial adjustment, the Irish were far in the lead. A confidential list published by one charitable society, of cases on their hands for 3 years and over, and giving names and addresses, showed that the great bulk of such cases were Irish. On this list, comprising 650 names, there were only 4 which could be recognized as distinctly German; of the rest, all might, and a great majority must, have belonged to persons of Irish birth or descent.

The Irish were especially hard drinkers, patronizing and conducting the numerous whisky shops in the city, while the Germans confined themselves largely to the milder lager beer.

And the Irish furnished an especially high proportion of the criminal class. The following table³ shows this, and also the facts about pauperism above stated:

TABLE 3.

Born in—	New York City.			
	Population, 1855.		Relief granted, average of 6 years, 1854-1860.	Arrests for crime, 1859.
	Number.	Per cent.	Per cent.	Per cent.
United States.....	303,731	48	14.2	23
England, Scotland, and Wales.....	32,135	5	4.5	7
Ireland.....	175,775	28	69	55
Germany.....	95,986	15	10.8	10
All others foreign.....	22,287	4	1.5	5
	629,914	100	100	100

It will be noted that while the Irish made up only 28 per cent of the total population of the city, they constituted 69 per cent of those receiving charitable aid, and 55 per cent of those arrested for crime. The Germans were 15 per cent of the population, 10.8 per cent of the paupers, 10 per cent of the criminals. The English, Scotch,

¹ Report A. I. C. P., 1856, p. 29.

² Report A. I. C. P., 1860, p. 49.

³ Compiled from data in report A. I. C. P., 1860, p. 49.

and Welsh, it is interesting to observe, fell below their proportion in the total population in respect to pauperism, but mounted above it in respect to crime.

It was said in 1864 that "as a class, the Germans and Swiss immigrants are among the most enterprising and prosperous; the English and Scotch rank next; while the Irish are less temperate and self-controlled than either."¹

The most harrowing pictures of tenement-house life, and the worst conditions, as presented in various reports, were seen in Irish neighborhoods. The Sixth Ward, the worst in the city in the early part of the century, was almost entirely Irish. The one distinctively German ward of the period, the Tenth, adjoining the Sixth Ward, although densely crowded, was quiet, orderly, pleasant, and even in fairly good sanitary condition.

In an account of one example of notable cleanliness in a very dirty neighborhood presented by an inspector of the council of hygiene, it was noted that of the 64 families in the house only 2 were Irish. The rest were German.²

The German immigrants, as contrasted with the Irish, came here in good physical condition from healthy country districts, and a large proportion proceeded directly to the country. Those who remained here were industrious and hard-working and orderly, as has been seen—small contributors to the city's pauperism and crime.

There was a type among them, however, that was regarded with a good deal of disfavor by their contemporaries. These were the ragpickers or "chiffoniers," as they were called, and they appear and reappear in the various sanitary reports, from which we get much of our knowledge of tenement-house life. Dr. Griscom called attention to these "chiffoniers" in 1842 as a type introduced within the previous few years "whose persons, like their occupations, were the most degraded imaginable."³ These were at that time to be found in considerable numbers plying their occupations along the streets, overturning the heaps of rubbish and filth in search of bits of paper, etc., or scraps of food thrown out of houses as garbage, which they either carry home to recook or eat upon the spot. Dr. Griscom seemed to think that these were importations from Paris, London, and other cities; but all indications go to show that most of them were country-bred Germans who had taken to this occupation through their frugal habit of saving and making use of every available bit of material, and had found their opportunity in the general prodigality of refuse dumped in great heaps and piles throughout the city.

Those that he spoke of plied their vocation along the streets; but many found their field in the big dumping grounds that grew up along the outskirts of the city, living in colonies near them. One such colony in the Eleventh Ward is thus described:

It is situated in the rear of Nos. — and — Sheriff street. The houses are of wood, 2 stories with attic and basement. The attic rooms are used to deposit the filthy rags and bones as they are taken from the gutters and slaughterhouses. The yards are filled with dirty rags hung up to dry, sending forth their stench to all the neighborhood and is exceedingly nauseous, operating upon me as an emetic. The tenants are all Germans of the lowest order, having no national or personal pride. They are exceedingly filthy in person and their bedclothes are as dirty as the floors they walk on. Their food is of the poorest quality, and their feet and hands, and doubtless their whole bodies, are anæsthetic, suffering from what they call rheumatism, but which is in reality a prostrate nervous system, the result of foul air and inadequate supply of nutritious food. They have a peculiar taste for the association of dogs and cats, there being about 50 of the former and 30 of the latter. The whole number of apartments is 32, occupied by 28 families, numbering 120 in all, 60 adults and 60 children. The yards are all small and the sinks running over with filth. The owner of one-half of this row is —, and of the other —. The latter gentleman is a wealthy man and lives with his tenants in the rear, although he owns the front house; he prefers the filth because he thus saves some money. He buys and sells rags—a perfect "chiffonier." Not one decent sleeping apartment can be found on the entire premises and not one stove properly arranged. The carbonic-acid gas, in conjunction with the other emanations from bones, rags, and human filth, defies description. The rooms are 6 by 10 feet; bedrooms 5 by 6 feet. The inhabitants lead a miserable existence, and their children wilt and die in their infancy.⁴

A large part of the "shanty" or squatter population described in preceding pages was made up of this element. By 1860 the ends of streets from Fifth street to the Harlem were used as dumping grounds, and chiffoniers gathered along near them. The squatter colony at "Dutch Hill," Thirty-ninth street and First avenue, was one of these.

These people (at "Dutch Hill") find employment in the quarry and manure heap near their homes. They possess cows, swine, goats, and fowls in large numbers. The women, boys, and some of the men are "volunteer assistants to the city inspector." They may be daily seen with their carts drawn by themselves and their dogs; or, if fortune has more signally favored them, a rickety wagon, drawn by a decrepit horse with harness of somewhat primitive construction, facilitates their labors. Going from house to house they ransack the ash barrels and beg the swill and other kitchen refuse to supply food for their cows, pigs, and goats.⁵

But it is pleasant to note that these German ragpickers, though on so low a plane, as to daily habits and mode of life were really on the upward road.

¹ Report A. I. C. P., 1864, p. 21. ² Annual Report of Intermats, 1842, p. 377. ³ Report Council Hyg., p. 286. ⁴ Report Council Hyg., p. 292. ⁵ Report Council Hyg., p. 177.

Dr. Griscom, who had so severely condemned them, speaks of "the perseverance and frugality of this class of operatives," one of whom lately heard of had "by his daily trade * * * amassed \$400, which he was about investing in Western lands." "Hundreds of these people," he says further, "derive a good support from the business in this city."¹

And the legislative committee of 1857, after commenting on the ragpicking colony on Sheriff street, says:

It is said that habits of economy and constant application to their wretched business enable nearly all, sooner or later, to accumulate sufficient funds to enable them to migrate to the West. We are told of a colony of 300 of these people who occupied a single basement,² living on offal and scraps, and who saved money enough to purchase a township on one of the Western prairies.³

In this circumstance, indeed—the fact that these people removed to the West as soon as they had saved up sufficient money to do so—is indicated one cause of the bad conditions that arise in cities on account of foreign immigration. The city acts like a sieve, letting through the physically sound, the energetic, and ambitious; keeping back the infirm, the very poor, and the lazy.

Many immigrants passed directly through the city to the interior, and these were of the best class; many, like these German chiffoniers, gave the city the benefit of their preparatory period of ignorance, poverty, and low standard of life, but betook themselves elsewhere when they had reached the higher stage of development in which they would have been of more value as citizens. And many more, coming here with debilitated physical constitutions, or without the mental or moral fiber needed for success anywhere, were unable or unwilling to go farther than the great city they entered.

It had early occurred to those interested in bettering city conditions that one means of relief would be to assist migration to the interior, to country districts.

This means, indeed, was suggested at the very time the immigration problem itself was formulated in the report of the Society for the Prevention of Pauperism for 1819, already quoted from. The managers say:

It would prove a great relief could means of employment be found (for the immigrants) when they enter our city. Many thousands who arrive in this country from Europe have been servants or manufacturers, and do not understand the art of husbandry; yet many arrive in destitute condition who have worked on the soil. A great many others are vigorous, healthy, and capable of learning the art of agriculture. Could some communication be opened with our great farmers and landholders in the interior, and ways and means be provided for the transportation of able-bodied foreigners into the interior and labor be provided for them, it appears to the managers that beneficial consequences might flow from the expedient. Many, very many, foreigners who are honest and industrious and who, for want of employment, are liable to become paupers, would gladly depart into the country and labor upon the soil or in workshops could they thus obtain a bare living. In this case our city would be somewhat relieved, the number on our criminal calendar diminished, and the emigrant now on the brink of pauperism, or begging alms and receiving charitable aid, become useful to himself and to the community. Instead of bringing up his children in idleness, temptation, and crime he would see them amalgamated with the general mass of our population, deriving benefits from our school systems, our moral institutions, and our habits of industry.⁴

In accordance with this thought, many schemes looking to the ruralization of immigrants were tried, one after another.

The Germans, in large proportion, went directly to the interior; but the Irish seemed to find it especially difficult to get away from the seaboard cities or to be got away, and not only from their great numbers, but from their peculiar habits of life—their proneness to intemperance and violence, their improvidence and readiness to depend upon charitable aid—they were the heaviest burden the cities had to carry.

It was remarked that—

They had an utter distaste for felling forests and turning up the prairies for themselves. They preferred to stay where another race would furnish them with food, clothing, and labor, and hence were mostly found loitering on the lines of the public works, in villages, and in the worst portions of the large cities, where they competed with the negroes—between whom and themselves there was an inveterate dislike—for the most degrading employments.⁵

By no means all of the Irish in the country were of this helpless, unenterprising class, however, and certain public-spirited men among them formed societies in New York, Philadelphia, and Baltimore early in the century to aid Irish immigrants in every way, but especially in procuring land in and removing to the West. These societies, in a memorial addressed to Congress asking for a grant of land in Illinois for settlement by Irish immigrants, set forth some of the drawbacks hindering the Irishman in his attempts to establish himself here, and urged that some assistance of the sort they asked would transform a class "regarded as burdensome to the settled inhabitants" of great cities into self-respecting, prosperous, and loyal citizens.

¹ Sen. Con. of Lab. Pop. in New York City; Dr. J. H. Griscom, 1845.

² Probably an exaggeration.

³ Report New York State Com., 1857.

⁴ Second Annual Report of Managers of Society for Prevention of Pauperism in City of New York, 1819.

⁵ A. I. C. P. Report, 1860, p. 50.

This particular scheme was not carried through, owing to the failure of Congress to make the grant. Had it been made, however, it would have been interesting to see how far the natural individualism of the Irishman would have been overcome by such special inducements; to what extent the Irish would have been enticed from the cities by them, and what would have been the effect upon public health, pauperism, and crime in our cities to-day.

The New York State commission of emigration, at its establishment in 1847, opened a labor bureau, which, in their opinion, had considerable success. In 1850 they report finding employment for 8,000 persons. Much of the work of the bureau was done in placing labor in the country upon farms. Agencies were established in several places in New York and other States, by means of which farmers were supplied with laborers of both sexes. Private societies took up this sort of work also, but accomplished little. The experiment was fairly tried; neither friends nor patronage was lacking. The causes of their failure seemed to be, briefly, about as follows: The commissioners of emigration were already providing for the immigrant class—that portion of it, at least, who needed only a little help and direction to find their places in the industrial scheme—as far as this could be done. It was said that 20,000 persons were annually “provided, relieved, and forwarded” by them.¹ Other able-bodied laborers did not seem anxious to leave for the West. It was quite true that work in the city was liable to fail during part of the year. It was inevitable, then, that if the supply of labor was to be kept up during the busy season there must be some unemployed during the dull season. But the laboring classes seemed to prefer remaining in the city to take advantage of the busy times, living upon past earnings in the dull times. It was said—²

As a general fact all who are able and willing to work, and are careful to economize their earnings, can here (in New York City) find sufficient remunerative employment to carry them comfortably through the year, and in many cases do much more. Such persons, of course, will not let go a certainty for an uncertainty. Hence they are unwilling to emigrate, and they can not be coerced. And why should they be? Their attachments are centered here, where they can live comfortably; they are needed in the city, and are not likely to become a public charge.

It was also found impossible to send the needy, unemployed poor into the country. In the hard times of 1857 the charitable societies of the city sent out a circular to the unemployed poor, asking those of them who would accept situations out of the city to report their names to the societies; and another circular to employers, which was published widely through the State of New York and the Western States, appealing for employment of any kind for any class of workers.

As a result of these appeals, not an individual offered to go to the country, and not more than a dozen applications for labor were received from the country.

In 1859 a special inquiry into the matter of migration to country districts was made by the Association for Improving the Condition of the Poor, through their visitors and district secretaries, whose close acquaintance with persons and conditions would enable them to secure reliable and valuable information. They were asked to canvass their districts and find how many families having male heads, or how many individuals, both eligible and willing, could be found to go to the West, if means were provided. The inquiry embraced the entire county and city and included 9,281 families, containing 44,557 persons aided by the association; and out of this number not one case was reported by the secretaries as available to send to the country.

Another aspect of difficulty with regard to these schemes was that in drawing off from the city, as they proposed to do, those able to make their way in the country, leaving behind the permanent paupers, they would be increasing the burden of the city instead of lightening it; on the other hand, had they proposed to send the refuse population to the Western States, those States would have been justified in protesting against a scheme of relief for the city that simply meant shifting the burden to them.

The summing up of the whole matter seemed to be that emigration schemes were not likely to have any great effect in reducing pauperism, because those who could make use of the opportunities for labor afforded in the interior could either get there themselves or find work in the city; while those who made up the bulk of the strictly pauper class either would not go or would not be able to care for themselves if they did go.

The net result of all these adjustments and readjustments, this groaning and racking of the social framework in the stress of new conditions, was, after all, a remarkably rapid dispersion of foreign immigrants from the city. Statistical proof of this has to be got at somewhat indirectly for the period before 1850, when no account is given in the censuses of the foreign born in the population. It will be seen by the accompanying table that the immigration to the port for the first decade was larger than the entire growth of the city, including, of course, immigration of

¹ A. I. C. P. Report, 1861, p. 34.

² A. I. C. P. Report, 1861, p. 35.

the native born from country districts and natural increase by births, so that a considerable proportion of the immigration of this period must have gone elsewhere. It will also be seen, as perhaps is a little surprising, that the rate of dispersion appears to become more and more rapid in each succeeding decade. That is, while immigration in the decade 1820-1830 was not much greater than the total increase of population, in the decade 1830-1840 it was almost 4 times the increase of population, in 1840-1850 it was over 5 times, and in 1850-1860 over 6 times the increase. Dividing the decade 1840-1850, the same tendency is seen.

TABLE 4.—*New York City.*

Years.	Increase in population.	Immigration to the port.
1820-1830.....	78,883	92,884
1830-1840.....	110,121	407,716
1840-1850.....	202,837	1,146,241
1850-1860.....	298,122	1,994,640

TABLE 5.

Years.	Increase in population.	Immigration.
1840-1845.....	58,513	305,105
1845-1850.....	144,324	841,136

That is, immigration for the first half of the decade was a little over 5 times the increase of population; for the second half, almost 6 times.

This change in rate might, at first thought, be attributed to the growing stream of German immigration, the Germans being, as has been noted, more inclined to agricultural pursuits than the Irish, but this can hardly explain the whole matter.

TABLE 6.

Years.	Immigrants from—		Proportion of German to British and Irish.
	Great Britain and Ireland.	Germany and Prussia.	
1820-1830.....	81,827	7,729	1:10½
1831-1840.....	283,191	152,454	1:1½
1841-1845.....	267,281	105,188	1:2½
1846-1850.....	750,482	329,438	1:2½
1851-1855.....	930,664	647,273	1:1½

There is a great increase in the proportion of German to Irish immigrants from the decade 1820-1830 to 1830-1840, but there is a decrease in the next decade, and only a very slight increase for the five year periods following. This is not sufficient to account for the change.

The crude impression, then, that the less crowded a country the easier and more rapid is the dispersion of population, would seem to be quite the reverse of the truth. There was, apparently, a greater tendency for immigrants to remain in seaboard cities in 1817, when the interior was an untrodden wilderness, than in 1860. The fact seems to be (within limits and subject to modifications) that as the population increases and becomes more highly organized adjustment to the social framework and dispersion from cities become easier of accomplishment. Thus, in the first half of the nineteenth century the opening of the wilderness, the growth of manufacturing industries in interior towns and cities, the development of transportation and ways of communication by mail and telegraph, were all means of facilitating the passage of the emigrant from the place where his presence was not desired and his labor not especially needed to places where his presence was not particularly objected to and his labor was greatly needed.

SECOND PERIOD, 1871-1900.

It will be remembered (see table, p. 275) that in the decade from 1871-1900 arrivals of each of the three nationalities, Italian, Austro-Hungarian, and Russian, for the first time made up over 1 per cent of the total immigration, and from that time on increased until in the decade just passed (1890-1900) all together constituted about half of all immigrants.

The Austro-Hungarian group, and the Slavonic peoples comprised in the Russian group do not so especially concern New York City, for, while about three-quarters of all immigrants of these races land in New York, a large proportion of them pass directly to the interior. The following table, giving, from the immigration reports for the year 1899-1900, the numbers in the different Slavonic race groups, and of the Magyars, who claimed to be on their way to certain points inland or who were intending to remain in New York, shows to some degree the general tendency of the different groups to settle down at the port of entry. It will be noticed that the number of Bohemians and Moravians arriving in New York, as compared with the number of those races arriving at all ports who gave New York State as their destination is, approximately, as 3 to 1; of Poles as 4 to 1; of Ruthenians and Magyars as 5 to 1; of Lithuanians and Slovaks as 6 to 1; and of Croatians and Slovenians as 9 to 1.

TABLE 7.—Destinations claimed by immigrants arriving year ending June 30, 1900.

Races.	Arrivals at all ports.	Arrivals at port of New York.	States given as destinations.					
			New York.	Pennsylvania.	Illinois.	Ohio.	New Jersey.	Massachusetts.
Magyars	13,777	11,353	2,435	5,198	287	1,583	2,712	117
<i>Slavonic races.</i>								
Bohemians and Moravians	3,060	2,329	776	139	841	317	30	42
Croatians and Slovenians	17,184	14,521	1,183	9,771	1,507	1,505	228	30
Lithuanians	10,317	9,170	1,069	3,699	1,658	97	505	1,331
Poles	46,938	36,835	9,363	15,671	4,911	1,410	3,977	4,748

Slovaks	29,243	25,392	4,055	16,085	1,278	1,683	3,605	289

a Includes a few Dalmatians.

Of the Hebrew part of the Russian group, and of other Hebrews, not so large a proportion landed at the port of New York in 1899-1900 out of all arrivals as was the case with the Slavs and Magyars, but a very large proportion gave New York State as their destination. To give the exact figures, 73.3 per cent of all Hebrew arrivals at all ports landed at the port of New York, and 72 per cent of all Hebrew arrivals at all ports gave New York State as their destination. This means that a very large number of the Hebrew immigrants settle down at once in the city.

Of the third group—the Italians—no less than 97.4 per cent of the arrivals for 1899-1900 were received at the port of New York, and 54.5 per cent of the arrivals at all ports gave New York as their destination. It is said that many Italians who claim to be coming to New York do not stop in the city, but are reshipped here by bankers and railway ticket agents to distant points, so that the proportion of those who will settle down in the city should be set considerably lower than the number of arrivals for the State would indicate. On the other hand, many Italians who are reshipped in this way return to New York City as their headquarters in their intervals of idleness, and common observation shows a great crowding of Italians throughout the city.

By 1890 these newer peoples had become a considerable element in the city's population. In that year, according to the United States census, the foreign-born population of New York City made up 42.23 per cent of the total population, as compared with 39.68 per cent in 1880, and the numbers contributed by the different nationality groups presented in the chart and table of immigration are shown in the following chart and table for the two decennial periods:

Immigration in New York City born in leading countries.

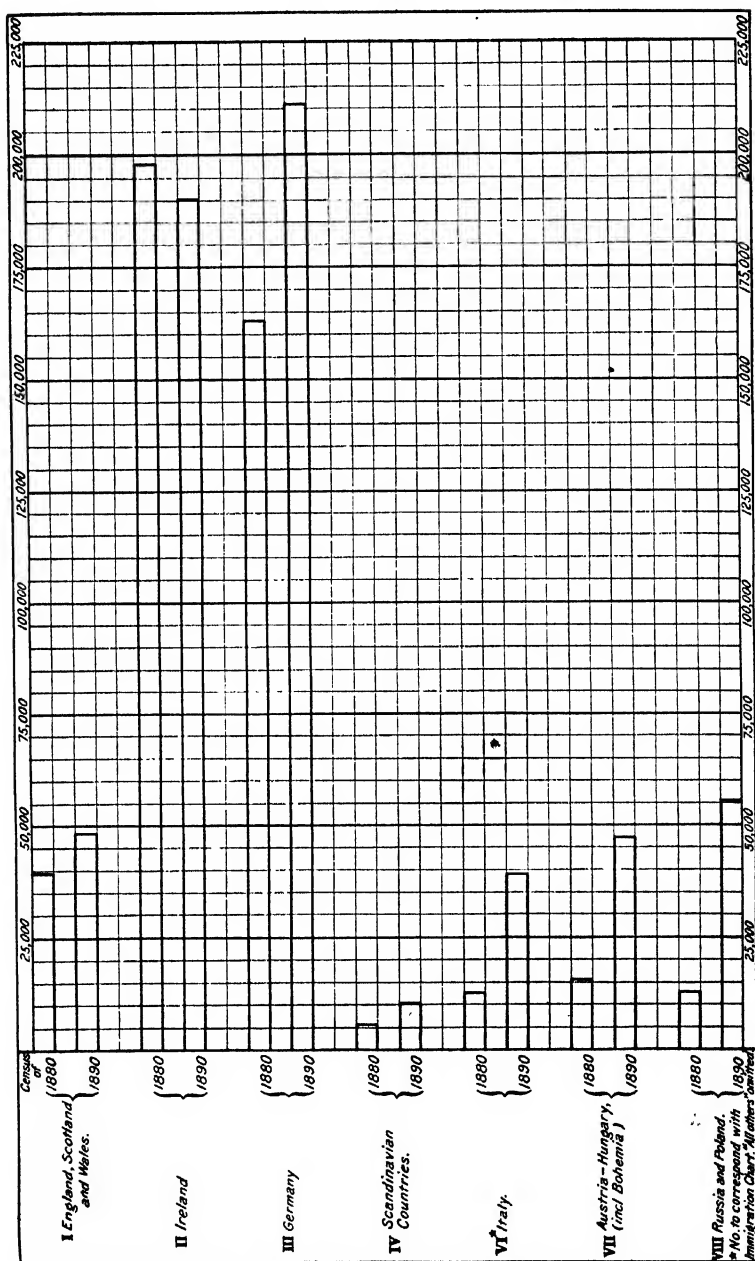

TABLE 8.—*Population in New York City.*

¹ Numbered to correspond with Immigration Chart—Class V, "all others," omitted.

It will be noticed that the Irish born have decreased both absolutely and relatively, and that the great German immigration of the eighties has by this time (1890) made the Germans the most numerous element in the foreign population. It will also be noticed how great was the percentage of increase, within the decade, of Italians, Austro-Hungarians, and Russians, and yet how very far any or all of these three groups were from reaching the numbers of either Irish or Germans. It will be noticed, too, how very small a part the Scandinavians played numerically in our foreign population, their energy and other striking characteristics leading us to regard them as more numerous than they really were.

Comparing the proportion each nationality bears to other nationalities in the city with the same proportion for the United States as a whole, it is seen that the city had more than its share of Germans, Irish, Russians, Italians, Austrians, Hungarians, and French, and less than its share of English, Scotch, Scandinavians, Canadians, Bohemians, Poles, Swiss, Chinese, Dutch, and Welsh. (See following table.)

TABLE 9.—*Foreign born, by nationalities, census of 1890.*

Nationalities.	Per cent of foreign born in New York City.	Per cent of foreign born in United States.	Nationalities.	Per cent of foreign born in New York City.	Per cent of foreign born in United States.
All foreign countries.....	100	100	Scandinavians.....	1.58	10.09
Germans.....	32.93	30.11	British-American.....	1.31	10.61
Irish.....	29.76	20.23	Bohemians.....	1.27	1.28

Scotch.....	1.76	2.62	All others.....	1.56	2.22
French.....	1.65	1.22			

To get an idea of the full extent of foreign influence in the city, however, native-born children of foreign parentage must be taken into account. This class shows foreign characteristics to a greater or less degree, from the young child of immigrant parents who came here after marriage—practically a foreigner in all essential respects—to the adult who has been reared in an American community and was born of parents who, perhaps, themselves came here in childhood and were to a great extent Americanized by the time their children were born.

Making this distinction, the population of New York City in 1890 was divided as follows:

TABLE 10.

	Per cent.
Foreign-born whites.....	836,986 = 42

Colored (including Chinese).....	25,874 = 2
	1,515,501 = 100

The foreign element in New York in 1890, then, made up four-fifths of its population, while the strictly native element was less than one-fifth.

These classes were divided as to age as follows:

TABLE 11.

General nativity.	Per cent under 5 years.	Number under 5 years.	Number 5 years and over.
Total population	11	164, 686	1, 350, 615
Foreign-born whites	9	6, 001	630, 985
Native-born whites, one or both parents foreign	19. 7	114, 808	467, 346
Native-born whites, both parents native	15. 6	42, 185	228, 302
Colored (including Chinese)	6. 6	1, 682	23, 982

And by sexes as follows:

TABLE 12.

General nativity.	Per cent of males.	Number of males.	Number of females.
Foreign white	49. 4	373, 481	322, 505
Native white of foreign parents	49. 1	285, 992	296, 102
Native white of native parents	49. 8	134, 457	136, 030

It will be observed that females predominate in all three classes. Among foreign immigrants in general males predominate, and it would be expected that in the foreign population of the city males would also predominate. As a matter of fact, however, not only are females in excess of males for this class, but in greater excess than in the class of native whites of native parentage, which may be assumed to show the normal proportion for a city population of males to females.

This is accounted for, it may be supposed, by the presence of a great army of female domestic servants in the city. An indication that this supposition is the correct one is seen in the fact that when the proportion of males to females in each general nativity class is given by wards, the wards below Fourteenth street, where there is comparatively little employment of domestic servants, and where foreign residents are settled in homes of their own or lodging places, show without exception a surplus of foreign-born males; while the wards above Fourteenth street, where there is, it is true, a considerable foreign resident population, but where the bulk of the domestic service is employed, show equally without exception, until the suburban Twenty-third and Twenty-fourth wards are reached, a surplus of foreign-born females.

The following table shows how all three classes of the population are divided by sexes above and below Fourteenth street, respectively:

TABLE 13.—Population of New York City. Census of 1890.

General nativity	Per cent of males.	Number of males.	Number of females.
<i>Below Fourteenth street.</i>			
Foreign white	52. 2	141, 326	128, 272
Native white, foreign parents	50. 7	106, 073	103, 777
Native white, native parents	52. 5	32, 091	29, 837
Total, excluding colored	51. 8	279, 490	261, 386
<i>Above Fourteenth street.</i>			
Foreign white	46. 7	160, 515	182, 571
Native white, foreign parents	48. 3	164, 864	170, 488
Native white, native parents	48. 8	92, 806	97, 410
Total, excluding colored	47. 8	418, 185	450, 469

It is here seen that in the uptown and downtown groups as well as in the whole city, the other two classes of population show the same preponderance of one sex or the other as the foreign born. For all classes males predominate downtown and females uptown—the downtown districts containing a large working population of single men and also a large “floating element” making their headquarters in lodging houses.

It is also seen, incidentally, how much greater is the proportion of foreign born to the total population in the downtown than in the uptown wards. In the wards below Fourteenth street the foreign born were about one-half of the population, the native born of foreign parentage about three-eighths, and the native born of native parentage about one-eighth; above Fourteenth street, foreigners were a little less than two-fifths, native born of foreign parentage also a little less than two-fifths, and natives of native parentage somewhat more than one-fifth.

Something as to the degree of social assimilation reached by any given race element in the total "foreign element" may be seen from a comparison of the numbers among them of the first generation, of the second generation, and of those of the second generation who have one native and one foreign parent.

The proportion of the second generation to the first is some indication of the length of time that the given nationality-element has been in the country, or of the degree in which they have become permanent settlers here; while the proportion of children arising from marriage between native and foreign parents is an indication of race tendency to amalgamate with the people already in possession of the country.

The following tables give the absolute numbers and percentages of these different classes in New York City in 1890:

TABLE 14.—*Population of New York City, 1890.*

The highest proportion of the first to the second generation is shown by the Hungarians, Scandinavians, Italians, and Russians, in the order named, the first generation being above 70 per cent for all. This is due, obviously, to the newer incoming of these four classes; but it is worthy of notice that the Russians, the very latest arrivals, have the largest proportionate population of any of the four groups, showing that permanent settlement in families begins for them earlier than for the others. The Italians, however, the next latest comers, follow closely in the percentage of the second generation, showing that with them, too, family life begins within a reasonable period of their coming here as immigrants. The Irish and Germans, as our oldest immigrants, show the largest proportion of the second generation, the Irish

standing above the Germans in this regard, as coming earlier, and diminishing of late years more rapidly in volume of immigration.

Of the second generation by far the greater proportion for all races had both parents foreign, of the same race. As would be expected, this proportion is high for the newest races, Russians, Italians, and Hungarians, in the order named. The highest proportion of all, however, is shown by the Bohemians, although these people, from longer residence here, show a larger proportion of the second generation than the three peoples just named. This is a curious bit of testimony to the peculiar exclusiveness or clannishness with which these people are charged. Notwithstanding longer acquaintance with the country, Bohemians living here will marry with Bohemians in higher proportion than Russians with Russians or Italians with Italians.

In this table it is to be noted the greater proportion of offspring from native mothers and foreign fathers than from native fathers and foreign mothers. The foreigner in general is on a lower social and economic plane than the native, and in general females are less inclined to marry into a lower social plane than are men; but in this case the preponderance of males in foreign immigration has brought a pressure to bear that has broken over that reluctance, and we see marriages of native women and foreign men from twice to nine times as frequent (according to races) as marriages of native men and foreign women. And, naturally, the preponderance of the former class is greater the newer the immigration.

The following table shows how the different nationalities were distributed throughout the city in 1890:

The accompanying maps¹ show, by different degrees of shading, the different degrees of density reached by the classes of population shown in the above table, but by smaller divisions of area, the sanitary district being taken as the unit in the maps instead of the ward, as in the table.

Of special interest is a comparison between the Irish map, the German map, and the map showing native whites of native parentage. The Irish and German groups are approximately of the same size, the German group being some 4,500 the larger; the group of native whites of native parentage is somewhat smaller than either, falling some 65,000 below the Irish. No other group given, however, approaches the first two so closely in size or can be used as so good a parallel.

¹ Map I, population, native white of native parentage; Map II, population born of Irish mothers; Map III, population born of German mothers; Map IV, population born of Italian, Russian, Hungarian, and Bohemian mothers.

before. The Italians are seen mainly in former Irish districts, the Hebrews in former German districts; and wherever these newer peoples came the older races began to move out. The Hungarians and Bohemians, too, are gathered into compact groups, and other smaller groups of different nationalities could be shown in like manner.

The Hebrews and Italians, however, of the newer races coming in, *ape*, it may be recalled, the ones especially important with regard to their influence upon city conditions.

The little handful of Italians that made up the immigration from Italy in the earlier decades were mainly a vagabond but harmless class of organ grinders, rag-pickers, bear leaders, and the like. Italians of this type were remarked in the Sixth Ward as early as 1864 as noticeable elements of the population, in the report of the council of hygiene, which does not mention their presence in any other district.

This ward and the Fourteenth, just above it, were apparently the first Italian districts. In the latter ward, near its northern boundary, just below Houston street, was a little colony worth glancing at in passing. This was in Jersey street, already described, in 1864, as an exceptionally offensive neighborhood, thickly settled by the very poor, three-fourths of whom were negroes. The houses in the street were then very old, built of wood, and much out of repair.

By 1879 the street was swarming with Italians of the ragpicker class. Their way of life was thus described:¹

* * * Here (in the yard of No. 5 Jersey street) on lines strung across were thousands of ragging up to dry; on the ground piled against the board fences rags mixed with bones, bottles, and papers; the middle of the yard covered with every imaginable variety of dirt. * * * We then turned to go into the collars, in which was a large and a small room. Opposite the door stood a stove, upon which meat was being cooked; to the right stood a bedstead roughly constructed out of boards; in the left-hand corner a similar one. The small room contains another. These board bunks were covered with 3 or 4 army blankets, and would each accommodate 4 men. There was no other furniture in the room, which was so dark that we could only see by waiting till the eyes became accustomed to the light. There was scarcely standing room for the heaps of bags and rags, and right opposite to them stood a large pile of bones, mostly having meat on them, in various stages of decomposition. * * * Notwithstanding the dense tobacco smoke, the smell could be likened only to that of an exhumed body. There were 9 men in the room at the time of our visit, but a larger number occupy the room.

It is a bit of testimony to the sturdy physical constitution of these people that even in such surroundings the inspector "met with no sickness excepting one case of whooping cough and a number afflicted with rheumatism."

Another picture of this colony, as it was in 1884, is as follows:

In Jersey street exist two courtyards. * * * Six 3-story houses are in each. These houses are old and long ago worn out. They are packed with tenants, rotten with age and decay, and so constructed as to have made them very undesirable for dwelling purposes in their earliest infancy. The Italians who chiefly inhabit them are the scum of New York chiffonniers, and as such saturated with the filth inseparable from their business. * * * The courtyard swarms with, in daytime, females in the picturesque attires of Genoa and Piedmont, moving between the dirty children. The abundant rags, paper, sacks, barrows, barrels, washtubs, dogs, and cats are all festooned overhead by clothes-lines weighted with such garments as are only known in Italy. Sorting is chiefly done indoors, but at times a ragpicker may be seen at his work in any convenient spot to be had. * * * In each yard live 24 families (nominally only, because lodgers here as elsewhere are always welcome), paying rents of from \$6 to \$8 monthly for 2 rooms, the inner one being subdivided by a partition consisting perhaps of a simple curtain, and measuring when so arranged about 5 by 6 feet each.²

The surroundings and habits of these people might be filthy, but as to their general character the earlier report says:³

Jersey street at first sight looks like a pestilence-breeding, law-breaking colony. A more intimate acquaintance with it, and a few words with one or two white and colored inhabitants, confirmed the first but not the second impression; no more peaceable, thrifty, orderly neighbors could be found than these Italians. They do not beg, are seldom or never arrested for theft, are quiet, though quick to quarrel among themselves, are equally ready to forgive. The officer on duty mentioned that this colony, numbering perhaps 200 Italian families, can not be matched by any similar number of corresponding social condition in New York City for their law-abiding qualities. He seems quite proud of them.

Lower down in the ward, on Crosby street, another colony of Italians was mentioned in 1879. Here will be seen the mingling of the newer Italian immigrants with the older Irish; the Italians, as the economically inferior race, occupying the rear tenements, and the Irish, as the product of longer years of tenement-house living, showing, one would infer from the description, an even deeper degree of filth and certainly of moral degradation than the Italians.

No. — Crosby street is a very low class of tenement house, bearing a bad reputation. The visitor for the section stated that it was the worst house and inhabited by the worst people he had ever met with, and that having refused relief to some of the tenants, he was afraid to enter it. * * * Four buildings, 2 front and 2 rear, each 6 stories high, stood separated by a yard about 20 feet in width. * * *

¹ Report of council of hygiene.

² Report of New York Association for Improving the Condition of the Poor, 1879, p. 64.

³ Report of Association for Improving the Condition of the Poor, 1884, p. 43.

⁴ Report of Association for Improving the Condition of the Poor, 1879, p. 64.

The rear buildings are occupied exclusively by Italians, all ragpickers, the front by Irish and a few Germans. An invasion of the front house revealed a shocking amount of dirt; in some instances the floors were invisible under the refuse and garbage. One family represented the mother as out of work, though I afterwards learned she was in her bedroom drunk, while the youngest daughter, half nude, was sitting on the floor, fairly surrounded with dirt, and the eldest, as she answered my questions, held her hand over her nose, which I could see was bruised and bleeding. The odor from the room was sickening. Learning that the cellar was used for ragpickers * * * I made an inspection. The cellar is divided into 21 compartments * * * containing more or less rags, bones, old papers, bottles, placed here before being taken to the rear dwelling to be assorted. * * * Large spaces, not subdivided, contained immense heaps of what even the ragpickers refuse. * * * In summer the stench is unbearable. The cellars in the rear house are also used for ragpickers' stores. I could glean but little information, as scarcely any of the Italians could utter a word of English.

By 1880 the Fourteenth Ward contained so many Italians that it was spoken of familiarly as "New Italy."¹ Italians had also come into the Fourth Ward, in Roosevelt street,² and were crowding more and more thickly in the Sixth. A large proportion of these early Italian immigrants were men without their families, and we hear of them most frequently as crowded together in lodgings of the character described in Jersey street.³ There was little pauperism among these people, if we may judge from the relative infrequency of Italian cases appearing in the reports of private charitable societies. It was noted that they were a class of people who worked and paid their rent.⁴

During these years the itinerant class—ragpickers, organ grinders, and the like—which predominated in the earliest Italian immigration, was being replaced by another class—the stable element of the population in the home country—the steady, industrious peasantry whom only extreme poverty induced to break the bonds attaching them to their native land. Called here by the industrial expansion of the country after the civil war, this class came as unskilled day laborers, were taken charge of in masses by Italian bankers and padroni, and sent hither and thither as occasion was found for their labor. New York City has been and is the headquarters of this class. As has been remarked, 97 per cent of all Italian immigrants to this country now land at the port of New York. Some proceed directly to other parts of the country, but a very large proportion find their agents or employers in New York City, are kept in the city until their services are required in some other part of the country, and return to the city in dull seasons, to be maintained, perhaps, by the contractor until other employment can be found, or at any rate to be on the spot when employment is offered.

The newer immigrants of this class are mainly men without families, either unmarried or having left their families at home, and many of them return year by year to Italy in the dull season with the money they have earned here. But after a few years of this the family is either brought over or the "cafone" marries and settles down here, becoming a permanent member of the community. This statement may seem a little too positive and definite, in view of the fact that the opposite claim is so often made, and that little or no statistical evidence can be offered in proof of the assertion. But too many bits of circumstantial evidence combine to substantiate this to be ignored—the increasing number of women in the immigration record, everyday observation as to the increase of women and children in Italian districts, the personal acquaintance of charitable workers with many family histories, observation by social students of life in Italy itself—all these produce the strongest possible impression that the Italian day laborer after a few years of taking himself most considerably off the hands of the city when he has no work to do, settles down here, when he has enough money to carry him through the year, with wife and family.

There is another class of Italian immigration, not so numerous as the former, but still of considerable importance. This is the class that in this country makes up the great army of barbers, bootblacks, fruiterers, and shoemakers in our cities and towns. These are, some of them, of the "cafone" class at home, but in general they are from cities and small towns in Italy, and have been engaged in some sort of commercial pursuit there. There is absolutely no doubt about this class being a permanent population; and it may be observed that their business success is notable, and that they have brought their trades generally to a higher level than that in which they found them. The Italian fruit peddler bestows a considerable amount of his inherited racial art sense in "composing" his wares to form an attractive picture; the Italian barber pays considerable attention to the attractiveness of his place; the Italian bootblack is not the little ragged urchin of yesterday with battered box and a shrill velocity of motion, but a well-kept looking individual anywhere from 15 to 30 years of age, with a regularly established place of business, ranging from the throne-like arm chair and umbrella to the regular shop as well kept as the barber's. There are bootblacks who make from \$10 to \$15 a day. The Italian shoemaker lags behind in this list, being of the old-fashioned cobbler type.

¹ Report of Association for Improving the Condition of the Poor, 1880, p. 12.

² Report of Association for Improving the Condition of the Poor, 1879, p. 67.

³ Report of Association for Improving the Condition of the Poor, 1884, p. 10 et al.

⁴ Report of Association for Improving the Condition of the Poor, 1886, p. 61.

There are, besides, many Italian watchmakers, bakers, confectioners, keepers of caffè and ice-cream saloons, wine dealers, grocers, dry-goods dealers, and many in other businesses. About 400 persons are employed in macaroni factories. There are also many tailors working for Jews, and cigar and cigarette makers. Some are to be found in department stores; and some, having found politics a remunerative calling, are found in the street-cleaning department and on the police force.

Still another element of the Italian population, not a very large one, however, is made up of persons of a higher social grade at home—young men of the upper and lower middle classes who have been either fully or in part prepared to enter some profession, or government office, and who can not find opportunity to do so. Conditions in Italy are such that this class is a large and growing one there. Such young men are not willing to work at anything but professional employment at home, but in a strange land they are willing to turn their hands to anything; even common day labor that will give them daily bread. Individuals of this class are to be found then among those of the two others, and in many cases, after a short period of work in this way, the worker finds his way to a more suitable position. This class, however, is the most difficult to provide for in the city, if they insist upon having the work which they have regarded as corresponding to their social standing. There is abundant opportunity for the unskilled day laborer, or for the tradesman, but the average educated European finds himself at a serious disadvantage in competition with Americans for the better grade of commercial or professional positions.

These are the main elements in the Italian city population. Skilled workmen from the north of Italy in large numbers go directly to the interior as marble-cutters, miners, mill hands, etc. There are, however, some 2,000 workers in marble and mosaic, and many mechanics, masons, stonecutters, bricklayers, carpenters, and cabinet-makers in New York City. Italian cabinetmakers are found largely in the piano factories.

The day laborers and the poorer part of the tradespeople are found with much the same habits as to daily life that were noted in the rag-picking class. They are not distinguished, as a class, for especial neatness and cleanliness. They live in close quarters, with bad air and little light, with 2 to 4 rooms to a family. Sometimes two families will live in 2 or 3 rooms.

All classes are highly industrious, thrifty, and saving. They are strict in keeping to their agreements; always pay their rent, doctors' bills, and lawyers' fees. They are considered very desirable tenants. In an earlier period little money was spent by this people on drink and vicious pursuits; but more lately considerable intemperance, gambling, and vice are to be seen in Italian quarters.

The tradespeople prosper rapidly. The Italian barber enlarges his shop, perhaps finally sells out and becomes a banker; the fruit peddler buys a little shop, then a big one, and may finally become a wealthy importer; and in like manner with the other shopkeepers.

The more ambitious and successful among them move to the suburbs and become property owners in Long Island City, Flushing, Corona, Astoria, etc.

The day laborer can not be said to make notable progress in the first generation. He succeeds well enough, however, it is said, to get out of the clutches of the padroni after 3 or 4 years' residence here.

In all classes the Italian of the first generation is somewhat slower than some other races to take on the habits and customs of the people he has come among. Italians are distrustful of other races and even of those of their own race who are not of their province. Notwithstanding the abuses of the padroni, Italians can not be induced to accept employment through other means. And in their colonies they gather in provincial groups. For instance, in the Mulberry Bend district are to be found Neapolitans and Calabrians mostly; in Baxter street, near the Five Points, is a colony of Genoese; in Elizabeth street, between Houston and Spring, a colony of Sicilians.

The quarter west of Broadway in the Eighth and Fifteenth wards is made up mainly of North Italians who have been longer in New York and are rather more prosperous than the others, although some Neapolitans have come into Sullivan and Thompson streets to work in the flower and feather trades. In "Little Italy," One hundred and tenth to One hundred and fifteenth streets, South Italians predominate. In Sixty-ninth street, near the Hudson River, is to be found a small group of Tyrolese and Austrian Italians.

Both men and women are slow to adopt American ways of dress. The women go unbonneted in peaceful unconsciousness of any need for change. The men may be distinguished from their Irish fellow-workmen a half block away by the characteristic Italian garments that they wear with the characteristic Italian attempt at the ornamental.

In the second generation encouraging signs of social progress are seen. Italian children are brought under the Americanizing influence of the public schools within a brief period after their landing here and before they learn the language, partly

through the workings of the compulsory education laws, partly through the double desire of the parents, first to have the children learn English so as to serve as family interpreters, next to get them out of the way in the narrow tenement-house quarters they call home. In school Italian children are found more or less difficult to discipline and irresponsible. They have no fear of authority, but they are good natured and when their confidence is won thoroughly loyal. They are fair students, better than the Irish, but not as good as the Hebrews and Germans at book work. They show, however, great talent for manual work, drawing, etc. One defect they have is lack of application. As one teacher expresses it: "At one moment they will be absorbed in what you are saying, and the next equally interested in a fly on the wall."

Italian parents, under the compulsion of extreme poverty, and also from lack of appreciation of the value of education, are anxious to get their children out of the schools and at work at as early an age as possible. This is the principal cause of the great amount of truancy among Italian children noticed in the large cities.

While the children are in school, however, Italian parents are most friendly to the school and the principal and most respectful of school authority. Sent for upon some question of discipline, they are never resentful toward the principal, as American parents are rather prone to be under like circumstances, and, indeed, show a somewhat terrifying eagerness to add discipline on their own part in the shape of corporal punishment to that already administered by the school.

From the desire or necessity of the parent to have the children go to work not a very great proportion of them go from the grammar school to the high school or college, or even through the grammar grades. The children themselves, however, once started in school, grow interested in their work and would be quite willing to keep on.

Comparing those who have succeeded in keeping on until the higher grammar grades are reached with those in the lower grades, a notable improvement is seen. Pupils in the higher grades are bright, active, alert, and clean. Principals and teachers wage a perpetual warfare against dirt, gaining a substantial victory in the highest grade that is most gratifying.

The boy who drops out of the public school from the lower grammar or primary classes is likely to become a day laborer like his father, but the one who has passed into the higher grades has acquired a desire for something better. Some will make an effort to graduate from the grammar school, will succeed in securing a year or two in the high school or city college, and will become teachers, doctors, and lawyers. Others, with or without this additional training, go into business. Some go into factories or become errand or messenger boys; many are employed in department stores. Boys who have reached this point are more unwilling to take to unskilled labor, it is said by those who are familiar with them, than the second or third generation of the Irish, and it is unfortunately true that their unwillingness goes so far that they will remain unemployed indefinitely, hanging about as corner loungers, if they can not secure the clerkships, factory places, etc., that they want.

It can not, however, be ascribed wholly as a fault to the Italian boy that his aspirations take the shape suggested by the public school itself, which is being criticised more and more freely as time goes on for its exclusive devotion to the bookish side of life, to the exclusion of the manual and industrial element in it.

Italian children who have gone a considerable way through the public schools acquire very definite ideas of social advancement. They begin to be ashamed of the habits and customs of their parents, and bring all the pressure to bear that they can to change these. The child thus becomes an important influence in Americanizing the parents, who are allowed no peace until the peculiar "old-country" customs that mark them off, in the child's mind, as a class apart from the dominant race, the American, are cast aside.

The adult Italian, too, has his opportunity for Americanization in the public schools if he wishes to make use of it. Under the city school system evening classes for instructing adult foreigners in the English language primarily, incidentally in some of the fundamentals of American civic life, are formed as rapidly as there is demand for them.

In all of the principal Italian neighborhoods are evening schools conducting classes for Italians, and Italian evening classes are also found in neighborhoods where they are not considered especially numerous as residents. The schools make especial efforts to bring the advantages they offer to the notice of foreigners. One admirable school in the Fourth Ward issued a circular in the Italian language, announcing three grades of study for Italians, stating that this involves no expense to the pupil, of whom the only requirement made is that he shall attend the school, and urging all in the neighborhood to come. "Taking advantage of this opportunity," the circular concludes, with a touch of Italian rhetoric, "you will deserve well of all men. Despising it, you will incur odium and blame from the Americans and from all those who desire your welfare and who are laboring so diligently for your benefit."

This circular was distributed broadcast in the most populous Italian quarter of the

city, but comparatively few pupils were gathered into the school. These were men of various occupations who needed the English language to help them in getting along. They showed little desire for education in general, their attendance was more or less irregular, and when they had learned the English they needed they dropped out. This is largely the case in other evening classes for Italians, but many individual instances of progress and real interest in advancement may be noted. In some cases Italians who were in English classes one year would be found taking bookkeeping and stenography in evening classes the next.

In these evening classes it is hard to keep the attendance up through the 90 nights which make up the year's allowance. This is hardly to be wondered at, however. The pupils in these classes are workmen and boys, and the wonder is that after a long and hard day's work they have the patience and energy to plod through books at night. The men attending these classes are mechanics of various kinds, cabinet-makers, bricklayers, stonemasons, barbers, and in large proportion common laborers.

Italian girls and young women are also taking advantage of evening classes, and are a remarkably bright, enterprising-looking set. Italian parents generally object to allowing their daughters to go out at night unattended, so that many of the girls appear in the classes with younger sisters as a bodyguard.

In these schools, besides the English classes, are classes in sewing and cooking, in stenography and bookkeeping, and other branches. The proportion of Italian girls who attend these evening schools is comparatively small, but those who do are nearly all aiming to enter the higher classes and to prepare themselves for clerical work in offices and the like.

A probable result of the spread of education among Italian girls will be to lower the birthrate of the Italian population in the city by postponing marriage. The Italian woman in Italy, of the lower classes, marries very young and bears very many children. The Italian woman of the first generation in this country does the same; but the Italian girl of the second generation, seeing other openings before her than matrimony, will marry later, make a better marriage when it is finally made, bear fewer children, and be able to provide for them better. This tendency, indeed, has already been remarked.

The class of Hebrew immigrants that have given most concern to the cities are those from Russia, eastern Austria-Hungary ("Poland"), and Roumania. This class did not begin to come in great numbers until the beginning of the persecutions of the eighties.

German Jews had long been settled in the Fourth and Sixth wards, as the familiar figure of the "old-clothes" man in Chatham (now Park Row) and Baxter streets indicates. And many Hebrew families had removed to the Seventh Ward between 1860 and 1870. Some of the Russian and Polish immigrants appear to have followed their German brethren to the Sixth Ward; but many pressed at once into the Tenth Ward, making the beginning of that settlement, which, every year with a greater circumference, is now known as distinctively the Jewish quarter.

By 1883 we hear of great overcrowding in Essex and York streets among Russian and Polish Jews. It was said that in one house of 16 apartments, of 2 rooms each, about 200 persons were quartered.¹ Like the Italians, the Russian and Polish Jews were poor, were dirty in their habits, but were industrious, and good rent payers. Many of those living in Essex street were peddlers, who traveled about the country during the week and were at home on Saturday nights only, when the overcrowding was exceptionally great.

The legislative commission of 1884 in its report² gives some statistics comparing different races as to overcrowding and cleanliness gathered in an inspection of a large number of tenement houses. Referring to the table presented as to comparative cleanliness the report makes the following comment:

It will be seen that the Germans are decidedly in advance, and are followed by the French, English, Americans, Irish, Polish Jews, and Italians in the order named. The low Irish, Germans, and the Polish Jews take very little care of their rooms. * * * The want of cleanliness among the low Irish is very often due to the laziness of the women.

A description of life in the "Big Flat"—a notorious tenement house on Mott street just above Canal—in 1886 gives us a glimpse of the Jews at this time, and of the conditions by which they were surrounded.³

In the "Big Flat" were gathered, on a given day in 1886, 478 persons, of whom 368 were Hebrews (156 Roumanians, 198 Poles, and 14 Russians), 31 were Italians, 31, Irish, 30 Germans, and 4 native Americans. On the first floor were rooms for 14 families, and these were mostly occupied by low women and streetwalkers.

Two of the first-floor apartments were occupied at the time the study was made by Jewish people (1 by Poles, 1 by Roumanians), 3 by Irish, 4 by Germans, and 1 by

¹ Report of A. I. C. P., 1883, p. 19.

² N. Y. State Senate Doc. No. 36, 1885, p. 45.

³ "The Story of the Big Flat," Report of A. I. C. P., 1886, p. 43 and following.

native Americans. The hallways were "hang outs" for all the hoodlums of the neighborhood, and after nightfall the lower floor was overrun with low women and young men who did not live in the house. None of the tenants living above the second floor were ever to be seen standing around the lower floor or doors. On the upper floors, 47 of the apartments were occupied by Jews, 6 by Italians, 6 by Germans, 5 by Irish, and 1 by native Americans.

The Jews were principally engaged in tailoring, but there were some 54 peddlers in the building. Both tailors and peddlers were closely packed in very dirty rooms, and lived upon poor and scanty food.

The children were "very poorly clad, having hardly a stitch on them, nothing but a loose gown, and no underclothing at all."¹ Their food during the day was bread, no butter, and that was eaten by them in the hallway—they did not know what it was to sit at a table.

Some indication of the general character of the different nationalities living in the house is shown by the record of arrests made here from January 1, 1886, to the date of the inspection, September, 1886. The arrests, by nationalities, were as follows:

United States	11	Ireland	1
Poland and Russia	7	China	1
Germany	4		
Italy	1	Total	25

Three of the arrests of Jews were for violations of corporation ordinances, leaving only four offenses of a more serious character corresponding to the offenses committed by the others arrested.

The Hebrew population in the city already dense in 1890, as seen by the map showing their distribution has increased tremendously since then. In 1890 they were seen within certain fairly narrow limits. No figures are as yet at hand to show their exact increase and dispersion, but observation of the different quarters of the city shows that they have extended their limits remarkably within the past 10 years. On the East Side they have pressed up through the Tenth and Thirteenth wards and through the Sixteenth and Eleventh, driving the Germans before them, until it may be said that all of the East Side below Fourteenth street is a Jewish district. As far as observation can tell the tale, the thickly compacted masses of Germans, seen in the map for 1890, are almost wholly dispersed from that region. Some went uptown to the neighborhood of Eighty-seventh street, on the East Side, and elsewhere, but most have gone to Brooklyn and the suburban districts. This fact shows that the city colony, however compact and hard to break it may seem to be, may, by some change in circumstances, be dissolved in a very short period of time, without any apparent effort and almost without public observation. The Germans did not like the proximity of the Jews, and so they left. A like influence may at any time scatter the Jewish and Italian colonies now so hopelessly, it seems, crowded together.

The red crosses on the Italian-Russian map show how continuous, even though slight, was the stream of Jewish population already directed up the East Side in 1890. By this time, 11 years later, the numbers in these neighborhoods are greater, and a large Hebrew colony has formed in the Harlem district, mainly between Ninety-seventh and One hundred and second streets, where the Italians begin, reaching up farther to the north; and here conditions are generally better than in the downtown district. The removal of a Hebrew family up here is usually a token of advancement—in assimilation, at any rate.

The newly arrived Russian Jew is kept in the crowded East Side, not only by his poverty and ignorance, but by his orthodoxy. In this district the rules of his religion can more certainly be followed. Here can be found the lawful food, here the orthodox places of worship, here neighbors and friends can be visited within a "Sabbath day's journey." The young people, however, rapidly shake off such trammels, and in the endeavor to be like Americans urge their parents to move away from this "foreign" district. When they succeed, the Americanizing process may be said to be well under way.

Economic advancement comes to these poverty-stricken Hebrews with surprising rapidity. There is no way of telling definitely what proportion of the very poor eventually rise out of that condition, or how long it takes them to do so. General observation, however, seems to indicate that the proportion is considerable and the rate rapid.

Many tenements in Jewish quarters are owned by persons who formerly lived in crowded corners of others just like them; and from this population comes many and many a Broadway merchant and professional men in plenty. It is a common saying that from Hester street to Lexington avenue is a journey of about 10 years for any given family.

¹ Report A. I. C. P., 1886, p. 47.

It is certain that the adult Hebrew immigrant, unlike the Italian, has definite aspirations toward social, economic, and educational advancement.

The poorest among them will make all possible sacrifices to keep his children in school; and one of the most striking social phenomena in New York City to-day is the way in which the Jews have taken possession of the public schools, in the highest as well as the lowest grades.

The city college is practically filled with Jewish pupils, a considerable proportion of them children of Russian or Polish immigrants on the East Side.

In the lower schools Jewish children are the delight of their teachers for cleverness at their books, obedience, and general good conduct; and the vacation schools, night schools, social settlements, libraries, bathing places, parks, and playgrounds of the East Side are fairly besieged with Jewish children eager to take advantage of the opportunities they offer. Jewish boys are especially ambitious to enter professions or go into business, and the complaint is made that they overcrowd such callings, refusing to enter occupations involving hand work as well as head work. But here, too, it must be urged, as in the case of the Italians, that the fault, such as it is, is partly to be ascribed to the ideals of the public school itself. And, furthermore, the Hebrew usually shows such excellence in these special lines that the community probably gains materially rather than loses by having his services offered in this way.

It is not all an upward road for the Italian and Hebrew immigrant, however. As in the case of the Irish and Germans, tenement-house life tends to their physical and moral deterioration.

The Jews, already accustomed to city life, have withstood the physical influences of the tenements most remarkably, keeping the death rate down perceptibly in wards where they predominate; but tuberculosis, a disease they do not bring with them from abroad, is now growing more and more common among them, due to living and working in insanitary conditions and surroundings.

There is considerable sickness among the Italians. The country-bred adult, unused to the confined conditions of the tenements, is liable to tuberculosis. Italian children born and reared in the tenements are anemic, and to this, as well as to unwise and irregular eating, their high death rate is due.

The moral surroundings, too, are bad. Not only are there, first, the evil moral influences of overcrowding in general, but also the contact with elements of population already deteriorated by a generation of tenement-house life.

The new immigrant, an unsophisticated Italian peasant or a poor Hebrew of quiet family life and moral traditions, is brought into a district where vice has been developed through years of a sifting process which has taken elsewhere the successful of the former generation of immigrants and left the failures where violence and intemperance, especial faults of that earlier generation, are prevalent.

Conditions in the "Big Flat" in Mott street described in preceding pages well illustrate the nature and character of the influences by which the new immigrant is surrounded.

In the Fourth, Sixth, and Fourteenth wards the Italians, and in the Seventh Ward the Hebrews, are thrown in with the corrupt remnants of Irish immigration which now make up the beggars, the drunkards, the thugs, and thieves of those quarters.

The Bowery, running up through the quarters where the newer immigrants—the Italians to the left, the Hebrews to the right—settled in greatest numbers, is the focal line of these evil influences, and the peculiar system of government which allows the conditions prevailing there to continue is to a great extent responsible for the evils seen to be growing in the foreign quarters.

Until within a very few years the Italian laboring population in New York was notably free from glaring vice and intemperance. There were few or no disorderly resorts for Italians, and such a practice as the importation of Italian women for immoral purposes was unknown. Under present city conditions, however, positive inducement having been given for the extension of vice of all kinds, many disorderly resorts have been opened in their most crowded quarters, and it is said that many Italian girls from Naples and other cities have been imported to fill them.

Within the last year or two the Hebrews also have shown tendencies to the grosser vices that have never before characterized them. It can hardly be doubted that a people of their general habits with respect to temperance and the family relation must have fallen under some alien influence to bring about such conditions as are now found to exist on the East Side.

It is in the light of all the above considerations that the records of pauperism and crime for the different races of immigrants of this period should be considered.

Both Italian and Hebrew immigrants are prone to pauperism of the form that consists in placing children out in some institution. This form, though burdensome enough to the community in which it is practiced, can hardly be regarded as so great an indication of the genuine pauper spirit as other forms. Italian or Hebrew

rents, in trying to get their children into an institution, are, from their point of view, simply doing their parental duty in getting for their children advantages of education, and so forth, offered by the public that they can not themselves afford to apply. If the free day schools are so good, and attendance there so greatly desired at children are even driven to go to them by compulsory school laws, why should they think, they think, the free boarding school (or "college," as they call the public institutions for children) be still more of an advantage, and why should they not secure it for their children? And the parents have no idea of being paupers themselves. The Italians and Hebrews work unremittingly, and manage to save enough for their own necessities to keep them from the almshouse. The following table from the Eleventh Census shows the number of paupers per million of the population of the first and second generation of certain nationalities. These statistics are for the country at large, but the general race tendency is shown in them.

TABLE 17.—*Ratio of paupers to the million of same nationality or descent, 1890.*

Foreign white.	Ratio to million.	Native white of foreign parentage.
Total foreign whites.....	3, 031	Total whites of foreign parents 412
Born in—		Of parents born in—
Ireland.....	7, 550	Ireland..... 834
France.....	3, 636	France..... 583
Wales.....	2, 538	England..... 491
Germany.....	2, 436	Germany..... 304
Scotland.....	2, 373	Italy..... 164
Spain.....	2, 326	
England.....	2, 163	
Poland.....	1, 486	
Bohemia.....	1, 439	
Italy.....	817	
Hungary.....	785	
Austria.....	779	
Russia.....	586	
Greece.....	533	

Now, as 50 years ago, the pauper population is predominantly Irish, both in the first and in the second generation. Germany is fairly well down in the list, while Italians and Russians (Hebrews) appear in a very favorable light.

With regard to the Hebrews it must be said that a great deal of charitable aid has been given them by fellow-religionists that does not consequently appear on the official records. But this aid is largely temporary in character, to tide the immigrant over his first few months here, and does not imply the existence of a large permanent pauper class.

Even this allowance does not have to be made for the Italians. Less, perhaps, is done for them by private charity than for any other class of people. There are no Italian hospitals, orphanages, and charitable societies to aid Italians as there are Hebrew institutions for the Hebrews. Consequently the great bulk of Italian pauperism appears on public records, and that is seen to be little.

The census of 1890 gives the following figures as to criminality of different races:

TABLE 18.—*Ratio of foreign white prisoners to the million of foreign whites.*

Total foreign white.....	1, 747
Above average.	Below average.
Born in—	Born in—
Greece <i>a</i>	Austria <i>a</i>
Spain <i>a</i>	Belgium <i>a</i>
Italy <i>b</i>	Russia.....
Ireland.....	Germany <i>b</i>
France.....	Poland.....
England <i>b</i>	Wales.....
Hungary.....	Denmark.....
Scotland.....	Holland <i>a</i>
	Sweden.....
	Norway.....
	Portugal <i>a</i>
	Bohemia <i>a</i>

a Less than 100 prisoners. Numbers too small to give certainty as to ratio.

b More than 1,000 prisoners.

Putting the matter in another way, Italians were 1.96 per cent of the foreign population, while Italian prisoners were 3.7 per cent of the foreign prison population. A like comparison for the Irish is 20.23 per cent to 35 per cent; English, 9.82 per cent to 12 per cent; Russians, 1.97 per cent to 1 per cent; and Germans, 30 per cent to 19 per cent.

Italians, then, are seen almost at the head of this list, and above the Irish; but in modification of this circumstance it must be remembered that the Italian population in general contained a far higher proportion of adult males (the criminal age and sex) than the Irish population, in which females and children were numerous.

From an inquiry made a year or two ago into rates of crime and pauperism in New York City¹ certain results appear that may be embodied in the following table:

TABLE 19.

Persons born in—	Per cent in total population New York City.	Per cent of almshouse paupers.	Per cent of workhouse inmates.	Per cent of penitentiary convicts.
Ireland	12.6	60.4	36.7	15.4
Germany	14	14	6.8	9
England	2.4	4.4	4.4	3.3
Italy	2.6	.68	1.4	2.5
Scotland7	2.2	1.4	.9
Hebrews from Russia and Austria-Hungary	3	1	1

In this record it will be noticed that Italy makes a more favorable showing; the figures of total population are those of 1890; the figures of institution population are averages for the ten years, 1885-1895, which affords a fair basis of comparison.

Coming to the second generation, the census of 1890 gives the following ratios of criminality for native whites of foreign parentage:

TABLE 20.—Ratio of criminals to the million of same nationality class in the general population.

Total native white of foreign parentage....	1,400	Parents born in—	
Parents born in—		England	1,207
Ireland <i>a</i>	3,666	Italy <i>b</i>	603
Scotland	1,787	Germany <i>a</i>	568
France	1,560	Russia <i>b</i>	229

a More than 1,000 prisoners.

b Less than 100 prisoners.

And the following for juvenile offenders:

TABLE 21.—Ratio of juvenile offenders to the million of same nationality class in the general population.

Foreign whites born in—		Foreign whites born in—	
Italy	784	Hungary	112
Spain	332	Holland	110
Poland	285	Native white, both parents born in—	
France	248	Ireland	1,069
England	211	Italy	840
Scotland	186	France	393
Ireland	146	England	299
Belgium	133	Germany	246
Germany	113		

Of the newer immigrants, then, Italy has the most doubtful record as to crime, not so bad as it has been believed, but still bad enough. The crimes most usually committed by Italians are crimes of violence, embracing murder, homicide, and the like; and the crime rate, principally from these causes, in their own country is high. There is reason to believe, however, that conditions there are changing for the better, which will cause a corresponding change in the character of future immigration. It has been claimed, and statistics are given to substantiate the claim, that the part of the crime rate due to homicide is diminishing regularly and continuously in Italy, owing to the general extension of the influences of civilization, such as education, development of commerce, transportation, communication by newspapers, mail, and telegraph. It is said, too, that emigration is helping in this process by, first, the greater prosperity brought to the country through returning emigrants, and, more powerfully, by the more enlightened ideas brought back by them.

¹ Byron C. Mathews: "A study in nativities," The Forum, January, 1900, p. 621.

As the Italian population increases here, moreover, the percentage of *females and* children increases, and this also will reduce their crime rate.

It is of especial interest to note how all these changes and distributions affected the tenement-house problem, and what tenement-house reform movements and the legislation resulting from them have been able to accomplish in remedying bad tenement conditions.

The agitation in New York City against tenement-house evils, begun by Gerrett Forbes, city inspector, in 1834, did not take effect in legislation especially dealing with tenement houses until 1867, when, as a result of the work of the council of hygiene, 3 years previously, a State tenement-house law was passed.¹

At this time, as has been noted in preceding pages, tenement houses were made over private residences, the "front and rear" double-barrack or single-barrack buildings extending nearly to the rear of the lot. (See cut, pp. 482-483, types 2, 3, 4, and 5.) In these types will be noticed the unventilated and unlighted inner rooms, and, in the worst examples, the insufficient yard space.

As to yard space, the law of 1867 provided for a distance of from 10 to 25 feet between front and rear tenements, according to their height, and for a "clear, open space" of 10 feet between the rear of any tenement house on the back part of any lot and any other building; but as discretionary power was given to the board of health to modify these distances in special cases, these provisions were largely nullified in practice.²

With regard to the ventilation of inner rooms, the law provided that rooms of less than 100 square feet floor area, not communicating with the outer air, or without an open fireplace, should be provided with "special means of ventilation, by a separate air shaft extending to the roof or otherwise, as the board of health may prescribe."³

This provision applied to old tenement houses as well as to new ones, and many buildings were fitted with small ventilating flues of about 4 by 6 inches in size; but few were fitted with an "air shaft" in the sense in which the term would now be used.

In all tenement houses—those already erected as well as those to be built—sleeping rooms without external windows were to have transom windows opening into rooms already opening to the external air; and in all tenement houses to be erected every room was to have either an external window or a "ventilator of perfect construction."⁴ A minimum area of one-tenth of the superficial area of the room was prescribed for external windows, and the top of one window, at least, in a room was to be not less than 7½ feet above the floor.⁵

The rooms themselves, in new tenement houses, were to be at least 8 feet in height. It was also provided that there should be chimneys running through each set of apartments, giving opportunity for an open fireplace or grate or stove, and that all halls must open directly on the outer air.

These were provisions dealing with light and ventilation. Special sanitary provisions, to meet some of the more glaring sanitary evils noted by the council of hygiene, were as follows:

One of the worst features—perhaps the worst feature—of tenement-house life at this time was the occupancy of cellars for living purposes. The law of 1867 sought to reduce this by providing that no cellar should be occupied unless it was at least 7 feet in height; had its ceiling at least 1 foot higher than the general ground level; had an open space across the front of at least 2 feet 6 inches wide and 6 inches deeper than the level of the cellar floor, and had a window at least 9 feet square.

Another great evil noted in sanitary reports up to this time was the insufficiency of the water supply in tenement houses in general. The law of 1867 provided that all new tenement houses must have water "furnished at one or more places" in the house or yard.⁶

To remedy the appalling general filth, depicted so vividly and variously in successive sanitary reports, the law provided that all tenement houses, new or old, "shall be kept clean," and that the owner should "thoroughly cleanse all the rooms, passages, stairs, floors, windows, doors, walls, ceilings, privies, cesspools and drains," when required to do so by the board of health.⁷

Other sanitary provisions were that yards and areas must be connected with sewers; that receptacles must be provided by the owner of each tenement house for garbage, ashes, and rubbish; that no horses, cows, sheep, goats, or swine should be kept in a tenement house; that contagious diseases must be reported, and that

TYPES OF DWELLINGS,

(From Report New York State Tenement House Commission, 1896,

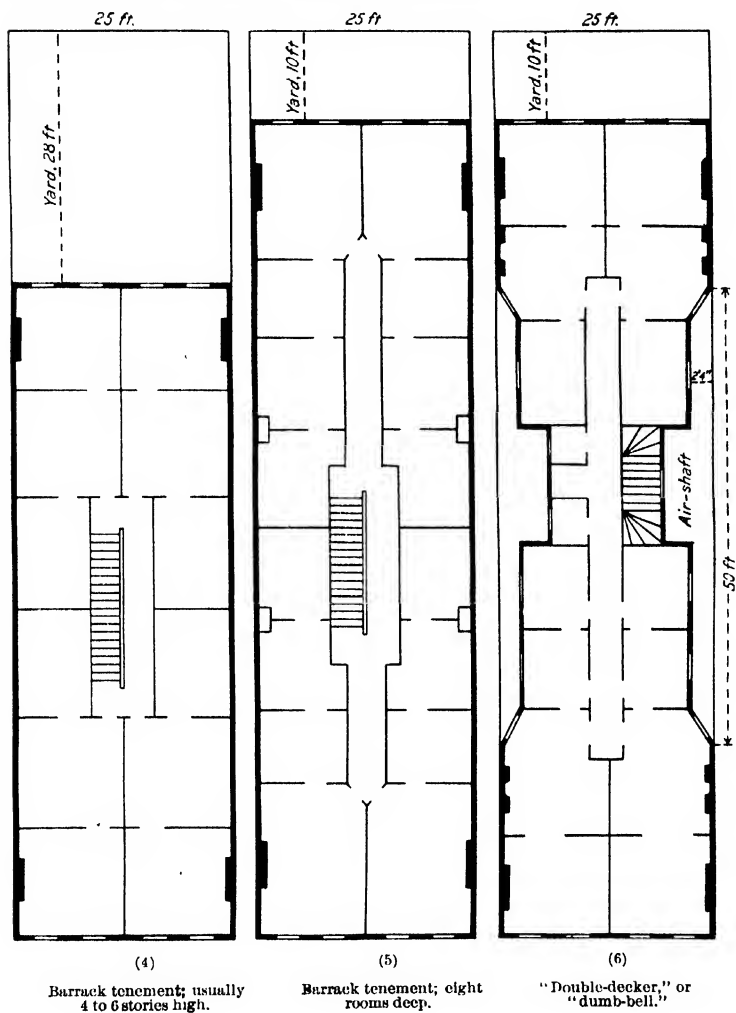

(1) Old-time private residence.

(2) Residence converted into a tenement house.

(3) "Front-and-rear" tenement.

NEW YORK CITY.

and Report New York State Tenement House Commission, 1900.)

every tenement house or lodging house should be provided with "good and sufficient" water-closets or privies, not less than 1 to every 20 occupants of the house, to be connected with the sewers on streets where sewers existed.

No further important legislation was enacted until 1879, when, in consequence of renewed agitation of the tenement-house question from about 1877 on, another State law was passed.¹

This law remedied two defects in the old law with regard to yard spaces. The old law had provided for minimum spaces between front and rear tenements only in cases where a tenement was built on the front of a lot, at the rear of which a building already stood. The new law made the provisions apply also to cases where a tenement was erected on the rear of a lot at the front of which another building already stood. And with regard to yard room at the back of buildings, the old law had provided simply that the "clear open space of 10 feet" required, should be between the back of the tenement house, and "any other building," thus leaving it possible to build up to the rear line of the lot if the rear of the lot just back of it happened not to be built upon. The new law provided that the 10-foot space should extend between the back of the tenement and the rear line of the lot.²

This provision stood directly in the way of building any more rear tenements of the old type, but additional ones may have been erected after this time, under the "discretionary power" which was in this case, as in many others, given to the board of health to modify the provisions of the law.

Up to this time there had been no legal limitation of the proportion of the building lot which might be covered by a tenement building, although the provisions as to distance between buildings had made some practical restriction. The law of 1879 provided that new tenements should not occupy more than 65 per cent of a lot, but as here, once more, discretionary power was given to the board of health to modify the letter of the law, it amounted practically to very little.

For the better ventilating of rooms the law provided that every room used as a bedroom should have an external window. This was a decided step in advance, but this, too, was nullified by giving "discretionary power" to the board of health, which might permit the omission of the external window if "sufficient light and ventilation should be otherwise provided, in a manner and upon a plan approved by" them.³

The first definite provision made with regard to overcrowding appears in this law, which requires in each tenement house, new or old, 600 cubic feet of air to each occupant.

The year that this law was enacted was further noteworthy in the history of the tenement house as the year of the invention and introduction of New York's most characteristic tenement house, the "dumb-bell" or "double-decker." (See cut, p. 483, No. 6.) This type of building was introduced as a "model" tenement, and has kept within the provisions of all the tenement-house laws, new and old, enacted before 1900, but it has proved to be one of the worst forms of housing ever employed.

The older types of the tenement house were rarely over 4 stories in height. The double-decker ran up, usually, to 6, often to 7 and 8, stories, thus cutting off more light and air from streets and yards, and gathering a denser population under one roof than the older tenements. Comparing the ground plans of the several types of buildings (see cut), it is seen that the yard spaces themselves are smaller for the double-deckers than was usual for the old "front and rear" buildings. The yard proper of the double-decker occupies only 10 per cent of the lot, as is the case with the worst of the old tenements, the building being kept within the limits of the law as to per cent of lot occupied by the side "air shafts" to be noted in the plan. These are, singly, usually 2 feet 4 inches in width throughout most of their length, or, taken together, as they adjoin one another in adjacent houses, 4 feet 8 inches, and from 50 to 60 feet in length. Surrounded as they are by walls from 60 to 70 feet high and with no intake of air at the bottom, it is plainly to be seen that they can afford very little light and almost no air, to say nothing of the impossibility of using them for the ordinary purposes of a yard.

The usefulness of the air shaft as a means of ventilation is not added to, moreover, by the practice tenants have of using it "as a receptacle for garbage and all sorts of refuse and indescribable filth thrown out of windows" which is "often allowed to remain rotting at the bottom of the shaft without being cleaned out."⁴

It was said in the course of the last tenement-house investigation that the air shaft should be called a "foul air shaft;" that it might be designated as a "culture tube on a gigantic scale," and that it was simply "a stagnant well of foul air emp-

¹ Laws of State of New York, 1879, ch. 504, p. 554. An act to amend chapter 908 of the laws of 1867, entitled "An act for the regulation of tenement and lodging houses in the cities of New York and Brooklyn." Passed June 16, 1879.

⁴ Advance sheets of part of the Report of the Tenement House Commission, 1900, printed privately, p. 17.

tied from each one of the rooms opening upon it;" and many people testified that "the air from these shafts was so foul and the odors so vile that they had to close the windows opening into them, and in some cases the windows were permanently nailed up for this reason."¹

Within the "double-decker" the halls are nearly always totally dark, being lighted only from small windows opening on the stairs or from the front door. Of the 14 rooms usually found on each floor, only 2 receive light and air from the street; 2 from the 10-foot deep yard at the rear, and the remaining 10 from the narrow air shaft only.

The rooms in this type of tenement are usually very small. The front room is about 10 feet 6 inches by 11 feet 3 inches. This is used on hot nights as a sleeping room often by the whole family. The bedrooms proper are about 7 feet by 8 feet 6 inches, and are hardly large enough to contain a bed. These rooms being "lighted" from the air shaft are almost totally dark.

From this time on new tenements in New York City (the present borough of Manhattan) were almost exclusively built upon this plan, and by the present time, 1901, make up about 60 per cent of the total number.

In 1885 the first attempt was made to restrict the height of buildings, the State legislature in that year enacting² that tenement houses should not be built higher than from 70 to 80 feet, according to the width of the street. But this provision did not reduce the "double-decker" appreciably from its usual height at that time.

The next important piece of tenement-house legislation was enacted in 1887.³

This law remedied certain defects of the law of 1879 with regard to yard space by taking away the discretionary power of the board of health to reduce the 10-foot distance between the rear of buildings and the rear line of the lot, and by extending the provisions of the old law as to the percentage of lot to be occupied to old houses which were to be altered and enlarged. The provision of the law of 1879 on this head applied to new tenement houses only, so that it was quite possible for an owner to alter and enlarge an old tenement house so as to cover the entire lot if he chose.

This law also provided that if halls did not open directly on the external air by means of a window the tenement house could not be used; that water must be supplied "in sufficient quantity at one or more places on each floor;"⁴ that water-closets "or other similar receptacles" shall be provided, not less than 1 for every 15 occupants of lodging houses, and not less than 1 for every 2 families in dwelling houses, and that "no privy vault or cesspool shall be allowed," "except when it is unavoidable," the board of health to see to it that no privy vault should remain connected with a tenement house later than January 1 of the following year, except in cases mentioned in the section.⁵

The provision requiring 1 closet for every 2 families was repealed the following year, and the enactment made that 1 closet should be supplied for every 15 occupants in tenement houses as well as lodging houses, and not less than 1 on every floor.⁶

The following tables give some idea of certain general changes in tenement districts and tenement conditions that had been going on in the years since the first tenement-house law was enacted.

The tables show changes in general density of population in the different wards between 1860 and 1890, the character of dwellings in the wards and the percentage of population in them, changes in the average number of tenants to each tenement house between 1864 and 1893, and other data bearing upon the general question.

It is seen here that in the lower West Side wards there has been a considerable decrease of general density, accompanied by an increase in the average density of population in each tenement house; that is, with the growth of business in this part of the city a large number of the old dwelling houses and tenements were torn down. Many of the residents of the neighborhood moved out altogether, decreasing the general density of population; many others of the poorer class, driven out of their former dwellings, crowded themselves into old residences not formerly classed as tenant houses or were accommodated in large tenements built on the sites of smaller ones. A like change is seen in the Sixth, Fourteenth, and Fifteenth wards— increase of business causing decrease of general density and increase of tenement-house density. In the Fourth Ward, in the same district, a decrease in density has been accompanied by a decrease in the average number of tenants to a house, due probably to the falling out of use of some of the more notorious large tenements and the replacing of others by business buildings. In 1864 there were 486 tenements in this ward; in 1893, 473. This is the general region once occupied by the Irish and now by their successors, the Italians. Housing in this region is still largely of the old "barrack" and "front-and-rear" type, although many double-deckers are to be seen.

The Hebrew district across the Bowery—the East Side wards up to Fourteenth street—however, is preeminently the region of the double-decker.

Business did not crowd greatly into this district, and as the fast-coming immigrants arrived, one great tenement after another of the "double-decker" type was erected on the sites of old private residences. Scarcely any other type of tenement building is to be seen here, and the capabilities of this type for congesting population are shown by the figures given in the tables for the wards where it flourishes. In Italian districts where the older type of tenement more largely prevails, tenement-house density is less, and also the rate of increase of tenement-house density between 1864 and 1893; while in Hebrew districts there is high tenement-house density and a tremendous increase of tenement-house density in the same period.

The tenement-house reform movement of 1894 is perhaps the most widely known of any that has been carried through in the city, but the legislation enacted in consequence of this movement in 1895 was not the most radical and effective of any. The law of 1895¹ took away the discretionary power of the board of health to

¹Laws of State of New York, 1895, ch. 567, p. 1099, vol. 2, part 1: An act to amend chapter 410 of the laws of 1882. Took effect May 9, 1895.

reduce the prescribed distances between front and rear buildings, and provided for a 5-foot space at the rear of corner lots.¹

The discretionary power given to the board of health to increase the percentage of lot to be occupied had been taken away in 1891, except for lodging houses and in the case of corner lots, but the law of 1895 restored it by providing while reenacting the 65 per cent limitation that "where the light and ventilation of such tenement * * * were, in the opinion of the superintendent of buildings, materially improved, he might permit such tenement or lodging house to occupy an area not exceeding 75 per cent of the lot."² The law of 1895 made the first provision with regard to air shafts, no previous law having required them or prescribed any minimum size or width therefor. The provisions of this law were: that no shaft or court of less area than 25 square feet should be considered as part of the free air space in computing the amount of lot covered by the building, that no air shaft 10 feet square and over should be covered with a roof or skylight, and that the superintendent of buildings might make and modify or change rules and regulations as to air shafts. The Greater New York charter 2 years later took away the power of the superintendent of buildings to alter regulations, although he still might make them, and made the first requirement of a minimum width for air shafts. The minimum width prescribed for these, both in corner and interior lots, was 2 feet 4 inches.³

The law of 1895 also took away the discretionary power of the board of health to permit the lighting and ventilating of rooms by other means than the windows prescribed by the law of 1879; it provided that hallways should be kept lighted at night and all day if not lighted by a window; and that ceilings of cellars used as living rooms should be 2 feet instead of 1 foot (as had been before provided) above the general ground level.

A special sanitary provision was that no wall paper should be placed on any wall or ceiling until the old, if there was any, should have been removed.

Laws of 1891 and 1892 had provided that no tenement house should be used for a lodging house, private school, stable, or for the storage and handling of rags, except by permission of the board of health. The law of 1895 made these provisions absolute, except in the case of a private school, which the board of health might, at its discretion, allow. This law reduced the number of cubic feet of air required from 600 feet for each occupant to 400 feet for each adult and 200 feet for each child under 12.

The net result of all this legislation seems to have been a considerable improvement in special sanitary conditions, aside from the general question of light and ventilation.

Cellar dwellings ceased to be a crying evil, due partly, however, to the general increase of housing accommodations as well as to legislation, which, it is seen, was not very drastic as to cellar occupancy.

The general nuisance of foul and stagnant water in yards and cellars, so striking a feature of early tenement-house life, was greatly abated. The visitor of 1900 could go about dry-shod, at least, in tenement yards and courts where 35 years before the accumulation of what should have gone off in sewers and drains made access almost impossible.

But on the whole the tenement-house evil was still so serious in 1900 as to lead to the appointment of a State tenement-house commission to investigate the subject and make recommendations for legislation.

The most serious evils found by this commission in their task of investigation were, in their opinion—

(1) Insufficiency of light and air, due to narrow courts or air shafts, undue height, and to the occupation by the building or by adjacent buildings of too great a proportion of lot area.

(2) Danger from fire.

(3) Lack of separate water closet and washing facilities.

(4) Overcrowding.

(5) Foul cellars and courts, and other like evils, which may be classed as bad housekeeping.⁴

A special and alarming result of the lack of light and air which the commission felt to be the greatest evil of tenement-house conditions at present was "that the dread disease of pulmonary tuberculosis had become practically epidemic in this city." Testimony taken before the commission at its public hearings went to show "that there are over 8,000 deaths a year in New York City due to this disease alone; that there are at least 20,000 cases of well-developed and recognized pulmonary tuberculosis in the city and in addition a large number of obscure or incipient cases," and "that the conditions in the tenement houses were directly responsible for the tremendous extent and spread of this contagious disease."⁵

¹ Ch. 567, sec. 8.

² Ch. 378, Greater New York Charter, sec. 1318.

³ Advance sheets of part of the Report of the Tenement House Commission, 1900, p. 7.

⁴ Report Tenement House Commission, 1900, p. 15.

The more noticeable points in the legislation recommended by the commission and enacted in 1901¹ may be briefly summed up as follows:

As to light and ventilation, the new law provides for tenement houses hereafter to be built that not more than 70 per cent of the ground space of interior lots, or 90 per cent of corner lots, shall be occupied, and that there shall be no discretionary power to modify this provision; that the height of a new building shall not "by more than one-third exceed the width of the widest street upon which it stands," and that each must have behind it a yard extending across the entire width of the lot, and varying in depth with the height of the building. A building 60 feet high, except when on a corner lot, must have a rear yard at least 12 feet in depth. One foot of yard space is to be added or may be taken away for every 12 feet above or below 60 feet; but the minimum depth of any yard is to be 10 feet. Buildings upon corner lots must have yards of at least 10 feet in depth.

The above provisions go but a little beyond those of the law that they supersede; the chief advantage arises in the taking away of discretionary power.

The provisions with regard to courts, however, are a long step in advance, and really do away with the necessity of strict provisions as to rear yard space. The fundamental idea of the different sections prescribing in detail the area of courts under different circumstances—whether outer or inner, on the lot line or within the lot—is that courts open to the street on one side (outer courts) shall be, generally, at least, 12 feet in width for buildings 60 feet in height, and that court spaces completely surrounded by the walls of buildings (inner courts) shall, under usual circumstances, have an area of 24 by 24 feet for the same height (60 feet). The dimensions given will be increased or may be decreased with the increase and decrease of height of buildings, but outer courts are not, under usual circumstances, to be less than 9 feet wide or inner courts to afford a space less than 21 by 21 feet.

It is also provided that inner courts must have ventilating ducts at the bottom of not less than 5 square feet in area and communicating with the street or yard.

Turning to the plan of the "double-decker," it is seen that this type of building, with its air shaft 4 feet 6 inches wide, having no ventilation from below, is disposed of for the future by the above provisions.

This law forbids in express terms the building of rear tenements, although other of its provisions would practically prevent their erection; and it also prescribes a minimum floor area for rooms. This is a better provision against overcrowding than one with regard to cubic air space in proportion to the number of occupants, which is extremely difficult to enforce. Moreover, as is stated in the commission's report p. 132, "the rooms in new tenement houses have become so small that it is now necessary to lay down minimum dimensions." The dimensions prescribed are, not less than 120 square feet of floor area for at least one room in each apartment, and at least 70 square feet for each other room. (Sec. 70.)

To remedy special sanitary evils the law of 1901 provides, for new tenements, that no cellar may be occupied for living purposes, and that no basement may be occupied unless the room is 9 feet in height (instead of 7 feet, as in the former law) and has its ceiling 4 feet 6 inches above the surface of the adjoining ground (instead of 2 feet as before); and that in each tenement house there shall be a separate water-closet, or a separate compartment, for every family. This last is an especially useful provision.

For already existing tenement houses the law provides that the provisions applying to new tenement houses with regard to percentage of lot to be occupied and to yard and court spaces must be complied with when any old tenement house is enlarged; and that any new rooms or halls constructed in old tenement houses must meet the requirements of the regulations for rooms and halls in new tenements.

An improvement of conditions such as are seen in tenement houses of types 3 and 4 see cut, pp. 482-483), and which were untouched by previous legislation, is to be expected from provisions of the present law regarding the light and ventilation of rooms in already existing tenement houses. As is stated in the commission's report "There are in this city a number of old, unsanitary tenement houses containing small dark rooms without any means of light or ventilation to the outer air. In some cases these rooms communicate with an adjoining room which opens to the street or to the yard, and in other cases there are even as many as 3 or 4 rooms in a line, only one of which communicates with the outer air. As the law since 1879 has required that every living room in a tenement house thereafter erected should have a window opening directly to the outer air, it is apparent that these buildings have for more than 20 years been violating fundamental sanitary rules."²

To meet this evil the present law provides that each room in already existing tenement houses must have either a window opening on the street or yard, or upon a court of not less than 25 square feet in area, or must have a sash window at least 15 feet square opening into an adjoining room which has an external window. It is further-

¹ Laws of the State of New York, 1901, ch. 334.

² Report Tenement House Commission, 1900, pp. 137-138.

more provided that an inner room that has to be ventilated by such a sash window must have at least 60 square feet of floor space, 600 cubic feet of air space, and at least 600 cubic feet of air space for each occupant.

The practical result of this provision will be that in houses 4 rooms deep (type 3, cut, p. 482) sash windows will be provided and fairly good ventilation secured, while in tenements of types 4 and 5 one of the dark inner rooms will probably be knocked out to make a court or air shaft of the size required to ventilate the other inner rooms.

The "double-decker," however, which type is seen in about 60 per cent of the tenement houses now on Manhattan Island, is left practically untouched by the present law, except that one finger is laid on the air-shaft evil by providing for a door at the bottom of the shaft giving sufficient access to it to enable it to be properly cleaned out.

A most important provision of the new law is one which requires the absolute removal, by January 1, 1903, of all school sinks and privy vaults. These latter were prohibited, except in special cases, by the law of 1887, and the great majority of those existing at that time have been done away with. But the school sink—a long vault lined with a sort of iron trough, and arranged to be flushed from time to time by running water into the sewer—which came into use in the older type of tenement houses to take the place of the prohibited privy vault, is practically the same thing as the vault, and is as great a nuisance, if not greater, since it admits gases from the sewer to be added to the natural foul emanations of the vault. The commission's report says: "These school sinks were, in nearly every case, found by the commission's sanitary inspectors to be in a horrible condition and a serious menace to the health of the occupants of such houses and the neighboring houses. From their construction it is very difficult to flush them, and the inspectors found many cases where they had not been flushed for weeks. In summer the stench is intolerable, and unquestionably causes a good deal of sickness."¹

No previous tenement-house law had attempted to deal with the social and moral evils arising from life in the tenements, except indirectly by provisions such as those prescribing that halls should be lighted, and that access to all rooms must be had without passing through bedrooms.

The present law, however, directs a special series of provisions against prostitution in tenement houses. Women carrying on the trade of prostitution in tenement houses are to be considered vagrants, and punished by commitment to the county jail. If a tenement house is used for immoral purposes with the permission of the owner, the tenement building itself shall be subject to a penalty of \$1,000; if so used with the consent of the lessee of the whole house, the lease shall be terminable. "Permission of owner or lessee" is to be assumed if proceedings for the removal of the offending tenants be not commenced within 5 days of notice of the unlawful use. The general reputation of the premises in the neighborhood is to be competent evidence. (Sees. 141-145.)

These provisions are thoroughly practical in character, and should bring about considerable improvement in moral conditions if enforced.

The question of enforcement of the laws, indeed, has been all along quite as important as that of the provisions of the laws themselves. That an excellent law is enacted is no indication that the good results expected will arise from it in practice.

The tenement-house commission of 1900, in the course of their investigation, found that of 333 new tenement houses in course of construction which were inspected in the borough of Manhattan, only 15 were found in which there were no violations of law. In the other boroughs there was no such house found in which there was no violation. Of 286 tenements inspected with reference to percentage of lot occupied, 282, or 99 per cent, covered more than 65 per cent of the lot; 274, or 96 per cent, more than 70 per cent of the lot, and 88, or 31 per cent, more than 75 per cent of the lot—the extreme limit of discretion given to the building department. Twenty-nine occupied 80 per cent of lot area or over.

The sanitary provisions of successive laws have not been systematically or fully enforced; the present practice of the department charged with their administration being to take action in regard to sanitary evils only upon complaint of individual citizens—they themselves taking no initiative in the matter.

Such failures of the law are due partly to provisions in the law itself, allowing officials discretionary power to modify its requirements, partly to simple neglect in its enforcement. City officials may not be interested in carrying out the law, or they may be positively unable to do so, owing to the inadequacy of the administrative force at their disposal.

The tenement-house legislation of the present year has endeavored to do away with these hindrances to tenement-house reform by omitting to grant discretionary power as far as possible, by making the desired reforms depend rather upon construction,

¹ Report Tenement House Commission, 1900, p. 149.

which if once secured enforces automatically the wished-for change, than upon inspection, which may at any time slacken up or be omitted altogether, and by providing for a separate tenement-house department, which shall stand before the people as solely responsible for the enforcement of the law and shall have a sufficient staff for that purpose.

From the tenement-house legislation of 1901 as a whole may reasonably be expected a material improvement in conditions of lighting and ventilation in new tenement houses and those of the oldest types, but not in the "double-decker." A gradual diminution of tuberculosis and other bad physical conditions arising from insufficient light and air may be expected to follow.

The special sanitary provisions of the law will do away with much of the open offensiveness still remaining and of the disease arising from this cause.

Social and moral evils will be somewhat reduced, directly by the provisions against prostitution, and indirectly by the provisions that make the tenement house a better dwelling generally. The administrative features of the law promise a more adequate enforcement than previous laws have had.

But no radical reduction of overcrowding, the great evil of the tenement, may be looked for. The provisions as to the height of buildings, yard spaces, room spaces, and so forth, will slightly reduce the density of population for separate houses in new tenements, but they leave the already existing density untouched. Furthermore, as new tenement houses replace private residences with the growth of the tenement districts, the general density of population for the city will increase.

All that may be expected from the new law in this regard is that it will check a possible rapid acceleration of the rate of increase of density that seemed impending under the law just superseded, with the pressure of population on housing accommodations.

If the measures adopted in the last tenement-house law, greatly as they improve upon former laws, do not, after all, fully meet the situation, it is an indication that no legislation practically attainable can do so. The commission had the problem plainly and without disguise before them; they also had clearly in mind the measures needed to do away with certain features of the evils noted; they found, however, that the enforcement of these would involve so much expense to owners, both by way of reduction of income from reduction of space to be occupied and by actual outlay for construction, as to put a stop to building operations. It was their conclusion, after thorough study of the conditions, that "adequate light and air, perfect sanitation, even passable home environment, can not be provided by the best tenement house which is commercially possible on Manhattan Island - that is, by the best tenement house which can be built with sufficient prospect of income to warrant its erection;" and that, since "tenement-house reform would not be practical which went so far as to put a stop to building new tenement houses," nor would it "if it compelled such extensive changes in old tenements that owners would turn them to other uses," they must recommend legislation which met the evils only in part. It is hard to see how any future legislation could overcome these difficulties.

On the whole, it does not seem that the newer immigration offers any greater or more serious problems than the old, except in so far as they add to the total numbers and increase the general overcrowding.

In the newer period general health conditions have certainly improved. There is no more of the sickness among immigrants due to unsanitary conditions on the passage over. Under the present immigration regulations only immigrants of fair physical condition are admitted to the country. In the city, notwithstanding bad tenement conditions that might be improved, the general death rate has fallen greatly since the fifties, due to a more enlightened sanitary system.

The newer immigrants arrive here at no lower social level, to say the least, than did their predecessors. Their habits of life, their general morality and intelligence can not be called decidedly inferior. No account of filth in daily surroundings among Italians and Hebrews can outmatch the pictures drawn by observers of the habits of immigrant Irish and even Germans. The Italian ragpicker was astonishingly like his German predecessor, and the Italian laborer is of quite as high a type as the Irish laborer of a generation ago.

In some cases the newer immigrants have brought about positive improvement in the quarters they have entered. Whole blocks have been transformed from nests of pauperism and vice into quiet industrial neighborhoods by the incoming of Italians and Hebrews.

Simple overcrowding, however, is an evil in itself, and when this takes place it becomes desirable to encourage tendencies toward movement out of the cities on the part of immigrants. How far this movement has already proceeded for certain of the newer immigrants may be seen in another part of this volume.

It should be remembered in making plans for the dispersion of immigrants how strong are certain inducements of real and genuine advantage for them to remain in a large city. That there are advantages offered in cities is shown by the fact that the native born are flocking there as well as the foreign born. The immigrants' journey across the ocean is as much a part of the great general movement from the country to the city going on all over the world for some years as is the journey of the American lad from the country town to the city.

Primarily, the city is the great industrial center. The principal occupation to be found by the immigrant in country districts—agricultural labor—must probably be regarded as, on the whole, less remunerative than any other. Mr. George K. Holmes, Assistant Statistician of the Department of Agriculture, gives the following estimates of actual earnings in 1890 of each large class of workers for hire (the large groups given by the Census Office) made by experts and not hitherto published:¹

TABLE 25.

Engaged in—	Number.	Earnings (millions of dollars).
Agriculture	8,500,000
Agricultural labor	3,000,000	645½
Trade and transportation	2,000,000	745
Domestic and personal service	4,000,000	943
Manufacturing and mechanical industries	5,000,000	2,197

The last class, one-third of the wage-earners, received one-half of the earnings of labor; the class of agricultural laborers, one-fifth of the wage-earners, received less than one-seventh of the total earnings.

An allowance of actual yearly earnings for each person in each class (taking count of unemployment) would be, on this basis, as follows:

Agricultural laborers	\$215
Domestic and personal servants	227
Trade and transportation	340
Lumbermen, quarrymen, etc.	372
Miners	420
Manufacturing and mechanical industries	445

In the cities, mainly, are to be found the opportunities for the higher paid employments, and the larger the city the greater the number of openings. It is quite true that the supply of labor may be greater than the demand in the larger market; but in the larger market each individual sees more chances at least of employment and thinks that he is as likely to be one of those lucky enough to secure them as any other.

Other advantages offered by cities are substantial ones to the immigrant. In the cities are the various institutions for the help and comfort of the poor that provide what they can not easily provide for themselves—the hospitals, dispensaries, charitable societies, schools, libraries, social settlements, and all such things.

Before the immigrant is too severely condemned for lingering in the cities such considerations as these should be taken into account.

CHAPTER X.

AGRICULTURAL DISTRIBUTION OF IMMIGRANTS.

[Tabulation and Text by KATE HOLLADAY CLAGHORN, Ph. D.]

I. INTRODUCTION.

A. DENSITY AND INCREASE OF POPULATION, BY STATES.

The first question to be asked with regard to the agricultural distribution of incoming peoples is, Where is there room for them?

The following tables, compiled from the Twelfth Census (1900), showing the present density of population of the country by States, throw some light on this question:

¹ Report of Industrial Commission, Vol. X, p. 152.

NORTH ATLANTIC.

Density of population, 1900.		Increase of population, 1890-1900.	
State.	Persons to the square mile.	State.	Per cent.
Rhode Island.....	407	New Jersey.....	30.4
Massachusetts.....	348.9	Massachusetts.....	25.3
New Jersey.....	250.3	Rhode Island.....	24
Connecticut.....	187.5	Connecticut.....	21.7
New York.....	152.6	New York.....	21.1
Pennsylvania.....	140.1	Pennsylvania.....	19.9
New Hampshire.....	45.7	New Hampshire.....	9.3
Vermont.....	37.6	Maine.....	5
Maine.....	23.2	Vermont.....	3.4

NORTH CENTRAL.

Ohio.....	102	North Dakota.....	70.9
Illinois.....	86.1	Minnesota.....	33.8
Indiana.....	70.1	Illinois.....	26
Missouri.....	45.2	Wisconsin.....	22.3
Michigan.....	42.2	South Dakota.....	16.8
Iowa.....	40.2	Iowa.....	16.7
Wisconsin.....	38	Missouri.....	16
Minnesota.....	22.1	Michigan.....	15.6
Kansas.....	18	Indiana.....	14.8

Arizona.....	1.1	New Mexico.....	27.2
Wyoming.....	.9	California.....	22.7
Nevada.....	.4	Nevada.....	17.15

¹ Decrease.

The tables give in one column the present density of States, arranged in the order of density; in a parallel column, the rates of increase from the last census period to the present, of the same States, arranged in the order of magnitude of increase. In the relation of these two columns to one another certain features in the general development of these States are indicated.

B. INFLUENCES AFFECTING DENSITY AND INCREASE OF POPULATION.

Leaving modifying circumstances out of account it might be expected that population would have increased most rapidly where it was already least dense. And this expectation is, in great part, confirmed by the tables. Divide the tables for the North Central, the South Atlantic, South Central, and Western States into two portions each, horizontally, and it will be found that, with one or two exceptions, the States standing in the upper half of the density column of each table are to be found in the lower half of the column showing increase. More than that, the order of names in one column, read downward, corresponds closely with the order of names in the other, read upward, thus showing a fairly regular inverse variation of relative density and rate of increase. But turning to the table for the North Atlantic States, it is seen that density and increase are practically parallel; that the States of greatest density are showing the greatest rapidity of increase. This is an indication of different economic conditions prevailing in these different sections.

The number of inhabitants that may be gathered upon a given area depends largely upon the economic activities to be followed.

Manufactures and commerce are able to support populations of a density of indefinite limit; hence the parts of a country where manufacturing interests predominate are able to show a high density accompanied by a high rate of increase for many successive years. This is the case with the North Atlantic States. The industrial pursuits that make up so great a proportion of the economic activities of these States not only absorb and indeed call for a rapidly increasing population, but also concentrate them in already densely populated industrial centers.

In parts of the country given over mainly to the ordinary forms of agriculture, on the other hand, the expanding population must pour out from the fields already occupied into new ones, and increasing density in any given portion will be accompanied by a decreasing rate of increase for that spot. The tables, then, show that only the North Atlantic States may be regarded as predominantly industrial in their character. In all the other sections population is seeking the less densely settled portions.

Other factors, of course, have to be taken into consideration to account for all the variations seen in these tables. A low degree of density may be accompanied by a low rate of increase in certain rural States because for one reason or another the limit of the profitable working of the soil has been reached. This is apparently the case with the three rural States of the North Atlantic division, which follow the order shown in the manufacturing States. This is also apparently the case in Kansas and Nebraska, where certain checks have been given to agricultural development.

The fact that Illinois stands high in the list of density and increase both shows the growth of manufacturing and commercial interests in that State. The Southern States, by their rates of increase and density, show that, notwithstanding their recent activity in industrial pursuits, they are as yet prevaillingly agricultural.

The question, then, of finding room for the immigrant seems to depend upon whether he is to be a factory worker or a farmer. If he is to be a farmer, opportunities will naturally be sought for him where population is least dense. Here again, however, a modifying consideration enters. Agriculture has its different phases. The mode in use in this country up to the present day is extensive cultivation—skimming the soil of its first natural richness without returning anything to it. Following this method the cultivator must use much land and new land; and when his sons grow up he must send them farther on to find new land for themselves.

Intensive methods, however, by which careful and thorough cultivation of the soil and the addition of proper fertilizing material give back to it as much as, or more than, it yields up in the form of crops, will, like the manufacturing industries, support populations up to a limit of density continually pushed farther and farther away as new inventions bring greater and greater productive power.

The field for the immigrant is thus widened. If he is able to follow the methods of intensive farming, and if the general development of the country is such as to make such farming profitable by giving a market for the produce he will find opportunity in localities which native farmers, accustomed to the older methods only, consider overcrowded.

C. FOREIGN FARMERS IN INTENSIVE AGRICULTURE.

There are many indications that the foreign peoples now coming among us are especially adapted to carry on intensive farming. Their history at home, their actual success here in those lines show this plainly. In the home countries intensive methods had to be learned as population pressed more and more closely upon the resources of the soil; and in this country the habits acquired at home are not forgotten. The foreign farmer puts his mind on his business, works steadily, and interests himself in keeping up the fertility of the soil and in extracting from it

every particle of product it will yield. Testimony was given before the Industrial Commission¹ that "the economic traditions of the European farmer are one of the most valuable assets in American agriculture." The witness, Prof. J. F. Crowell, instances the Scandinavians of the West, the Huguenot colony of North Carolina, the Pennsylvania Germans, and says that such colonies "have been the mainstay and bulwark of progressive agriculture."² The chapter on Italian agriculture in this country, just following, shows that the Italians have in a high degree the qualities fitted for successful intensive farming and are largely engaged in it, and scattered references throughout the parts of this report dealing with the separate states confirm the same thing. The chapter on the Bohemians shows that this people is especially skilled in intensive methods and especially tenacious of them. Hungarians also are promising intensive farmers;³ the Dutch have made a notable success in the Northern States and are now finding their way to the South; and the Germans everywhere are successful in this sort of farming.

The first condition, then, of enlarging the field for the immigrant is met; he is able to engage in intensive farming. The second condition, that such farming should be required to provide for the needs of the community so as to afford a profit to those engaged in it, is also met. The growth of cities and of industries is bringing about just this demand all over the country, as will be seen by the reports from various States following, which indicate that there is no large part of the country, however thickly settled, that has not opportunities for good intensive farmers.

II. DISTRIBUTION OF CERTAIN NATIONALITIES.

A. ITALIANS.⁴

The ever-increasing Italian immigration to this country presents this striking feature, that, although 80 per cent of it is composed of the peasantry of Italy, it does not come to till the American soil, but settles itself in the American cities, where it meets with and causes endless evils. On account of these evils the well-disposed and good-hearted American observer will say that the Italians in not having gone to till the soil have made a mistake, for which they pay dearly. This is, indeed, their original sin, from which they shall be redeemed only by going back to agricultural life on the soil of their new country. The moral of the fable of Anteo, who was strong only as he was united to the soil, ought to be recalled to their vivid and poetic imaginations, because it applies to their case.

In trying to ascertain the causes of this social Italian-American phenomenon, one should consider the conditions under which the Italian peasant leaves Italy and the conditions which he meets in this country. First, he leaves Italy poor, having been there for endless generations—perhaps since the Romans of old had their large estates in Apulia, Campania, Sannio, Lucania, Sicily, and Sardinia, of which Pliny says: "Latifundia Italia perdere"—only a servant of the glebe; that glebe which for a thousand years he has watered with the sweat of his brow. This has been an ungrateful work, through which he has never been able to ameliorate his position, to acquire social standing, nor to attain instruction and education.

In many instances he sold or mortgaged his little holding or borrowed money in order to purchase the passage ticket for himself only, or he obtained it on usurious conditions from one of his relatives or friends in America, some one of whom had already found work for him. In every case he leaves his family at home, the thought of which always fills his heart with pain. The contemporary Italian immigrant, owing to the fact that a great many Italian families have already come to join their relatives, invariably promises his family that he will send for them as soon as his condition will permit; but when families had not yet ventured to come to America, and when only men were emigrating, they left home with the understanding that they would send help to their families, the money to raise the mortgage or pay debts, and at last would return to live the rest of their days in a certain ease with the money saved in America. Undoubtedly there have been a good many cases of this kind, which have given rise to the belief that the Italians come to this country to work, live in abject economy, and at last go back to Italy with their savings. One makes no mistake in saying, however, that those who carried out this plan almost invariably came back to America, unless they were unable to do so, for the reason that during the years of their residence in America they acquired habits and customs which they could not carry out in their native land when they went back to it.

⁴ Contributed by Alessandro Mastro-Valerio, Chicago, Ill., editor *La Tribuna Italiana*.

Furthermore, the Italian peasants of the central and southern parts of Italy, and of the islands, who are known by the name of "cafoni," and who form the bulk of Italian immigration, are not a rural population (except in the provinces of Naples and Caserta, and the western part of Salerno, which are exclusively agricultural) in the sense in which that term is understood in this country and in the northern part of Italy.¹ There the peasants huddle in towns, which in many cases number as many as 50,000 inhabitants. Those towns are the outgrowths of the burgo of feudal castles, under whose protection they were built. The Italian peasant has lived there for many generations, only to go out early in the morning to the farms, gardens, fields, and vineyards, which sometimes are miles away, and to come back in the evening. Only during harvest time and for certain special duties, do the Italian peasants and farmers and their families sleep in the country. The reason for this habit is found in the insecure protection the open country afforded, on account of wars, barbaric incursions, brigandage, and malaria, to persons and property. This implies the lack of proper and comfortable rural houses for the peasants, who have only rude buildings and huts, except some country villas which look more like strongholds than country places.

One should not wonder, therefore, at the fact that the Italian peasant emigrating to this country with or without his family, does not see his way to go and live the pioneer life in rural districts where his own language is not spoken. The women would object to this more than the men, because they have had less occasion than the men to leave the native burg. But after all, one could not say that this is an insurmountable obstacle which would confront the Italian "cafone" willing to come pioneering or farming in this country, for many Italian "cafoni" of the aforesaid regions of Italy, having emigrated to Brazil and to the Republics of the river Plata, have become as good pioneers and farmers as the English, the French, the Scotch, the Germans and the Scandinavians have proved themselves to be in this country.

My personal experience enables me to affirm that whenever an Italian peasant, after a certain number of years of struggle in an American city, is induced to go back to his old calling, he and his family adapt themselves admirably to the new surroundings, and take up the habits and customs of the American pioneer, farmer, or country gentleman.

One reason for his lingering in the cities is that he has been kept in such subjection on account of his former occupation—agriculture—that he feels ashamed of himself and his work. He comes to this country still detesting it, and here he throws it away with the same pleasure that Hercules had in tearing from his body the shirt of Nessus.

The Italian peasant leaving his burg for America is entirely ignorant of the possibilities of American agriculture, and it never occurs to him that he could earn money and make a position for himself by tilling the American soil, having been accustomed to look with distrust and hate at the soil, not as the *alma parens*, but as a cruel and ungrateful stepmother. None of his countrymen who are already here and who send money home, or have brought it home themselves, ever write or say that they earn their money by working the soil, first for others, and afterwards for themselves, as farmers. Of the moral and material advantages of American country life, of the comforts and independence it affords, of the rights and duties of the American farmer, as pioneer of civilization and as an exponent and example of the American principles of self-government, which can not be learned in American cities, owing to political corruption, he is totally ignorant, since he has always been a servant of the glebe, with many duties to perform and very few rights to enjoy. He never had the right to vote at home.

These are the conditions under which the Italian peasant lands in this country. Having to work for his living and for the support of his family and to economize whenever he can, he accepts work wherever he can find it or through whoever can find it for him, being too ignorant of the language to ask for it himself. Hence arises the middleman, who hires him to the contractor or to the construction departments of the railroads. The middleman he calls "boss," but the American calls him "padrone" and the way in which the latter sells him and keeps him the "padrone system."

It is impossible to believe that the Italian working in the country, seeing the splendid American farms, made more beautiful by spring, summer, and fall and a growing crop, does not feel a desire to till the soil in the way in which he sees it done, which seems to give splendid promise of prosperity and comfort. Certainly he must feel the old ingrained instinct, bred in him for thousands of years, awakening in him. I venture to say that there is not an Italian cafone doing unskilled work on a railroad grading, who, at the sight of an American farm, with a white-fenced and red-roofed house, with a revolving windmill, capacious stables and outhouse, with extensive fields where crops are growing and maturing, or of a pair of rob et

¹ Pasquale Villari, "Lettere Meridionale."

American horses behind a plow, or a well-filled cart of produce, or a herd of cows, sheep, or swine, or of a court well stocked with poultry, does not feel the nostalgia for his old calling and a strong attraction to the soil, which he would like to till again in that diversified and intensive way for which he is so famous.

He does not know, however, how to get the land and the means to work it until it produces. He does not know of any of his countrymen who, by word or example, could show him the possibilities of becoming a farmer in America. He is ignorant of the laws governing the proprietorship of land, and he has no hint at all of the homestead law by which, after a few and easy formalities, he could obtain 160 acres of Government land at once, while for generations, perhaps, he has never possessed a single acre of it.

The Italian immigrants, having settled so largely in the American cities, have formed in their centers of Italian population which are always attracting other immigrants. Considering that the great majority of Italians who compose these centers are country people, they should have been established in the country. If this had been done, the Italians in America in general would have been more respected. Hence the imperative necessity of the establishment of Italian agricultural centers, or nuclei, to attract the Italian peasants who come to this country.

The greater part of the Italians in this country derive their living by working for the American people, but the remainder of them earn it by work necessary to satisfy the needs of their countrymen. These needs Americans or those of other nationalities can not well supply, from lack of a mutual understanding, caused by racial differences which have not yet been overcome. Hence the immigration of certain Italians who come purposely to live upon their countrymen, and in many cases not very honorably. That among this class of people there are a good many individuals who are unprincipled and self-seeking it is useless to deny, because their indifference toward the painful conditions of the Italian cafone in American cities, upon whom they prey meanwhile, is apparent in all the Italian city colonies. These individuals are just those who have helped to make, under other circumstances, the life of the Italian peasant unbearable at home, so much so that he has been compelled to stop working the Italian soil and emigrate to this country, hoping for better thing.

Professor Nitti, of the University of Naples, has words of praise for the Italian cafone, who at last has had and is still having the courage to abandon bad conditions at home and come to America. But he has scathing words for the class of people who have made the condition of the Italian peasant at home quite unbearable, and for those individuals of the same class who are following him over the Atlantic. Living on their countrymen they think that they have no moral or patriotic obligation to elevate their minds or their hearts from their present narrow state. It is to their interest to leave them in this condition, in order that they may make of them tools for the acquisition of mercenary political power, by selling their votes to the political wire pullers and slate makers with whom American cities are infested. This is the most deleterious work they could accomplish, for on account of it the Italian cafone will never acquire civic education, but will despise the idea of true American citizenship, of which he has received the benefits. It seems that in order to foster their own interests, these unscrupulous Italians think they must keep their compatriots in the American towns. It has even occurred that an Italian, while advising a wretched countryman to go to the country, received a mild reprimand from another Italian, a man of some prominence, for giving such advice. It was evident that the advice was against the interests of the prominent Italian. For truth's sake it must be said also that from the class of Italian peasants in American towns bosses or padroni often develop, just as from a group of slaves there sometimes springs a most inhuman overseer, whom the slaveholder employs to look after his human holdings. These nefarious men forget their former condition, and prey upon their old companions in the same way that they themselves were preyed upon. As a swarm of crows, of wolves, and buzzards invariably follows a fighting army to prey upon the dead, these individuals follow the endless stream of Italian immigration wherever it is directed, to prey upon it, and the Italian, although he is compelled to accept their rapacious help, looks at them with the same terror that the wounded on the battlefield look at the cloud of flying crows circling in the air above. If the cafone had come to America alone, and if he had not been followed by these individuals, his condition would not have been as bad as it is now.

In regard to health, city life is most pernicious to the Italian peasant and especially to the children. Putting aside all other considerations, the thought of these poor little creatures ought to inspire well-disposed and generous people to make efforts to induce the cafoni to go to the country.

In my judgment, the children of the Italian townsmen are degenerating. The full-grown children are not nearly so well developed as their parents. A visit to the crowded Italian settlements of any American city would convince the observer. Hardly a child who is not affected with rickets can be found, and those who are

bowlegged are so numerous as to excite the deepest amazement and pity. In an Italian family it is an easy matter to distinguish the children born and raised in Italy from those born and raised in this country, because the former bear resemblance in size and health to their parents and the latter do not.

The Italian peasants in our towns do not follow the rules of hygiene and diet which are conducive to perfect health in this country. The long winter compels them to remain much of their time indoors in the single or double room, where a badly constructed stove must be kept always lit and from which poisonous gases often escape. In many cases the domiciles, which are always bad, are under the street level, and therefore damp. Their rooms are not renowned for their cleanliness, and in addition, the washing and drying are done in them. The women and children who on account of the cold are driven inside suffer more than the men who are out working. In regard to diet, the Italians have a marked predilection for certain kinds of food which they must satisfy at all cost. That they satisfy it at the cost of their health is a matter of fact. Farinaceous foods, in the shape of bread and macaroni, vegetables and fruits and olive oil, are most favored by the Italian peasant. In Italy they took to the mill the wheat they raised or bought, and sieved the flour more or less imperfectly. Out of the flour they made a bread, which though not so white as that usually seen here, but rather brown, had all the nutritive elements of the wheat, protein as well as carbo-hydrates; while out of the cheap American flour which they buy now they are getting bread which is white, it is true, but poor in the bone and sinew making protein and rich in the less nutritive carbohydrates. One may safely say that the bran which is given to cows and chickens has more nutritive substance than the white flour the Italian peasants buy at the store, out of which they make large quantities of bread and macaroni. With such a diet the bones of the Italian children do not grow strong enough to support the weight of the body, and therefore, although other causes contribute, so great a number of them are deformed.

When the Italian peasants are not at work on railroad construction or other excavations they live an idle life in the American towns, spending the money they have earned above the amount which has been sent to their families in Italy.

During the long winter months they rarely find anything to do in town. Sometimes they are employed in cleaning the streets of snow whenever extra help is needed. Often they perform vile and disgusting work, such as that of picking rags and all sorts of refuse from garbage boxes—victuals, bones, glass, etc. The sight of an Italian woman, old or young, following this practice is not unusual, while that of Italian children picking cigar stubs from the street gutters is very common.

Almost all this idle time is passed by them in the saloons and in other resorts of their countrymen in the street or in vacant lots playing ball.

One can not help thinking how profitably they could employ their energy during this time if, instead of living in town, they were farming for others or for themselves. They are generally considered as common, unskilled laborers without any special adaptability except that of taking a shovelful of earth from one place to another, because people do not know their ability as intensive farmers, gardeners, vine growers, etc. They do not know what an Italian family can do on a farm.

Recently the "American Agriculturist" published an article from one of its subscribers in Ohio, in which the writer says that if an American farmer wishes to grow rich, as he is doing, he must take, as he has done, an Italian family on his farm. He describes the work of his Italian family and compares it to that of a family of ants or bees. A special characteristic of the Italian is his wonderful capacity for "picking"—anything and everything. An Italian woman working or strolling in the field will fill her turned-up apron with many things which she will find, and even make herself so useful by destroying all insects which she believes are harmful to vegetation that she would be an object of wonder and admiration to the American farmer in general, as she is to the Ohio farmer in particular. And to think that thousands of such Italian families are degenerating in the American towns!

The suffering of the Italian cafone has found a sympathetic echo in the hearts of the Italian people from the Alps to the sea, of the King and Queen in whose hands the government of the kingdom is intrusted, of the representatives of the people, and even of His Holiness the Pope and the whole clergy. Therefore ways and means, public and private, by law and by personal and collective efforts, have been planned and carried into effect to relieve the pitiable conditions. The diplomatic and consular authorities have reported and acted according to the means at their disposition. Often members of Parliament have come to America to investigate for themselves and for the Government. And at last the emigration law, after years of study, discussion, and delay, has been passed and enacted.

But, strange as it may seem, the proper remedy has never been urged, viz, inducing the Italian cafone of the American towns, by any means and at all sacrifices, to establish himself in the country. This should have been recommended by the official investigators or by subsequent legislation as the only radical and

definitive way to solve the problem, but other less radical and in many instances inefficacious means have been suggested and approved. These measures are inspired by a most watchful state paternalism, which sometimes seems incompatible with the legal position of the Italian in this country, by whose laws he is protected. To protect Italian emigration abroad is the principle which inspires the Italian Government. The establishment of Italian agricultural centers or nuclei with the cafoli of the American towns, around which the incoming cafoli and spostatati would be helped to gather, without being compelled to stop in the American cities, as the northern immigrants do, has never been suggested in official or private reports, as far as we know, during the discussions of the emigration law in the Italian Parliament.

The attention of the Italians of the United States, and of the thousands of existing Italian societies, should be called to their duty of redeeming the Italian good name in this country. They should understand that the only means to rebuild the reputation of the Italo-American in general is the plow. It is useless to deny that the better class of Italians are living under the shadow which bad city conditions are casting; and it is easy to understand that unless they wish to be always in the dark they must do something to relieve the situation. This movement to the plow ought to be started by Italians and encouraged by the Americans friendly toward them, and by the Italian Government, as the surest means of following and protecting Italians abroad. But if official paternalism has failed to see such a necessity and provide accordingly, there have been individuals in the United States who have noticed it and carried it out to the best of their capacities and possibilities in ways and to results which are described in the following pages.

ITALIAN AGRICULTURAL COLONIES.

1. Vineland, N. J.

This is the first Italian agricultural colony in the United States, and was founded by an Italian political refugee to this country, Signor Secchi de Casale. He established the first Italian newspaper in New York, "*L'Eco d'Italia*," with which he kept alive the love for Italy among the few Italians of the United States, Mexico, and Canada. He was a disciple of Mazzini and a friend of Garibaldi, and of the other Italian patriots, with whom he had fought for the independence of Italy. In 1849, after the unsuccessful attempt to found a Roman republic, he emigrated to New York with some of his companions. They lived together on Staten Island, in the village of Stapleton, where the house which they occupied, with Garibaldi, still stands, north of Backman's brewery.

Signor Secchi de Casale was very active in this country in behalf of the cause of Italy, both among his countrymen and the American people, who as a whole sympathized with that country in its struggle for liberty. He was a man of heart, who, as the Italian immigration to this country was increasing, made it his duty to help the immigrants to the best of his ability. A good many Italians who now enjoy good positions in New York and elsewhere in the United States were helped by him with advice and protection. His work in favor of the poor little Italian street musicians, who at that time were brought to this country by unscrupulous men, first known to the American people by the name of "*padroni*," is remarkable. In this connection he was instrumental, with the aid of the Italian consular and diplomatic representatives in this country, in inducing the Italian Parliament to pass, in 1874, an act for the purpose of abating this human exportation from Italy to this and other countries. King Victor Emmanuel knighted Signor de Casale, as a recognition of his services toward his country and his countrymen of America.

Just the standing monument to his memory is the Italian agricultural colony which he founded at Vineland, N. J., and which is now the most prosperous of the Italian colonies of the Eastern States. The stream of immigration of Italian cafoli had just commenced to set toward New York, when he saw the necessity of inducing them to go to farm the American soil instead of settling in the cities. The evil results of such a practice were evident, even at the first. He therefore proposed to divert the stream of immigration elsewhere. He found in Mr. Charles Landis, of Landisville, N. J., a most valuable helper in his plan. This gentleman being a large landowner, put large tracts of land at the disposition of Chevalier de Casale for his colonization scheme.

The colony was founded in 1878 with a few Italian peasants, and since then it has grown wonderfully—to such an extent that it now counts about 5,000 Italians, engaged at Vineland, Landisville, and Plainfield, all adjoining towns of the State of New Jersey, in highly remunerative agricultural and even manufacturing pursuits. The Italians of Vineland have been able to produce wine from their vineyards since 1881. This was the first Italian wine made in the East. Some wine is still made in the colony, but not in such large quantities as at first. Viticulture has

given place to truck farming and to the cultivation of sweet potatoes, which have proved very profitable. The settlements include three Italian societies of mutual help.

Chevalier de Casale foresaw the mistakes which were in store for the Italian peasant if he crowded in the cities, and with his paper, "*L'Eco d'Italia*," persistently gave loud warning. By the foundation of his Vineland colony he was giving an example of the way to avoid the fulfillment of a future which must cause suffering and shame, worthy of Dante's *Inferno*. He wished that his colony should be an example for others to follow, and therefore he put all his soul, which was that of a patriot and a philanthropist, into the care of its foundation and management. But he had very few imitators, because indifference, if not greed and selfishness, was in the hearts of those who surrounded him and who came here afterwards.

Chevalier de Casale died in the year 1885, but his noble work as patriot, editor, and colonizer will remain a dear memory in the hearts of the Italians of the United States.

2. Bryan, Brazos County, Tex.

This colony was founded by chance about the year 1880 by some Sicilians who went to work on the main branch of the Houston and Texas Railroad. When the work of the road was finished they found inducement to buy some land on the Brazos River which was good for cotton, but is sometimes subject to inundation. The culture proved profitable, and the first settlers attracted friends and relatives. Now the colony counts about 500 persons, all told. They own a church, of which Father Petillo was once the rector.

Other Italians are engaged in the culture of rice in the rice fields of southeastern Texas, and many more are truck farming around the large Texas towns, particularly Dallas, Houston, and San Antonio.

A settlement of Italians near Dickinson engaged in truck farming and furnishing vegetables to the city of Galveston is noticeable. In Texas there are also many Italian cotton planters, who are scattered all over the State. Worthly of mention is a group of Italian vineyards in the neighborhood of Gunnison, Tex.

3. Asti, Sonoma County, Cal.

In 1881 there were many Italians in San Francisco asking for work. They could not speak the language of the country and found difficulty in obtaining employment. They were generally good, willing, and able farmers. On the other hand, California, containing a larger territory than the Kingdom of Italy, was only inhabited by 1,000,000 population.

The soil and climate of California are similar to those of Italy. The olive, the fig, the orange, the lemon, the flowers, and the grapes thrive in this section of the world as well if not better than in Italy, as in California there is yet a virgin soil which has not been impoverished by centuries of cultivation, and consequently gives luxuriant products without fertilizing.

There one could see on one side farmers asking for work, and on the other, the farm asking for laborers, to whom it would give the richest returns. The question then was: How to unite the elements together.

Mr. A. Sbarboro, an enterprising Italian of San Francisco, spoke to several of his countrymen about the project of forming a cooperative association and engaging in the production of grapes, which were then commanding a high price. He met encouragement on all sides, notably from that eminent surgeon, Dr. Paolo De Vecchi, who has honored the Italian name and his profession in the State of California.

Mr. M. J. Fontana, who, beginning as a poor boy, by energy and activity has succeeded in becoming the head of the largest fruit-canning establishment not only in the United States but of the world, was one of the most fervent supporters of the enterprise.

Pietro C. Rossi, then a bright, energetic young man, who had recently arrived from the district of Asti, Italy, whose ancestors for generations back had been grape growers and wine makers, and who, himself, during the vacations from his college studies, had devoted himself to the practical part of wine making, was the most important acquisition made by the colony. He devoted his immense energy and bright intelligence to the enterprise, was soon elected the president, and contributed largely to the great success eventually attained by it.

Henry Casanova, S. Campodonico, G. B. Cevaseo, V. Ravenna, Antonio Daneri, N. Giamboni, M. Perata, Dr. G. Ollino, and other patriotic Italians, assisted in the organization of the colony.

Thus encouraged, Mr. Sbarboro launched what was intended to be a strictly cooperative farming association. The funds were to be raised by the payment of monthly installments of \$1 per share, the same as the building and loan associations. Two

thousand two hundred and fifty shares were subscribed, which gave an income of \$2,250 per month. A board of 9 directors was elected by the stockholders, all serving without any remuneration whatever.

The organizers took good care not to commit the error of many institutions of a like character by falling into the hands of sharpers who have a tract of land for sale that may be worth, say, \$10 per acre, and who, by manipulating the directors, saddle it on the company at perhaps \$50 to \$100 per acre—the beginning of its sure failure.

Avoiding this mistake, they put their money in bank until they had accumulated \$10,000, then appointed a committee of 3 directors to seek for a proper location on which to commence work. This committee traversed the State, visiting some 40 different locations, examining minutely not only the quality and richness of the soil, but the salubrity of the climate, its adaptability for growing grapes, which would make not only quantity but quality in wines. Above all, they examined the rain gauge of years past, and finally, fortunately for the colonists, selected a tract of 1,500 acres of rolling hill land, healthy, never having suffered for want of rain, traversed by railroad, with a station which they named "Asti," expecting, as they eventually did, to make as good wine in the new Asti of California, as that which was made in the old Asti of Piemonte, Italy. The station was only 3½ hours by rail from San Francisco.

The first cost of the land was \$25,000. They paid the \$10,000 that they had in the treasury on account, and every month for fifteen months thereafter, \$1,000. The other \$1,250 they used in grubbing up the immense oak trees that were situated on what was then a sheep range, and prepared the land for setting out the grape cuttings.

While making the by-laws Mr. Sbarboro inserted an article which read as follows:

All permanent employees on the grounds shall be members of the association. The preference shall be given to Italian-Swiss persons who are either citizens of the United States or have declared their intention to become such.

The article was intended to benefit the laborers. When everything was ready for work, Mr. Sbarboro called a number of laborers to his office and explained what they were expected to do. Their wages would be from \$30 to \$40 per month, with good board, wine ad libitum, and a house to sleep in. But in order that they should take an interest in the work, each laborer was to subscribe at least five shares of stock, for which \$5 per month would be deducted from his wages. He would then be interested in the profits to be made in the enterprise, and when the land became fruitful, he would, if he so desired, be entitled to receive a number of acres of the land which he had helped to cultivate.

But they could not understand the value of cooperation. Notwithstanding much patient explanation of the advantages which they would derive from becoming stock holders, Mr. Sbarboro could not succeed in inducing a single laborer to go to work, if he was to be compelled to take stock in the association.

The organizers were thus obliged to dispose of their stock to intelligent business men of the city and pay the laborers entirely in cash instead of partly in stock.

Whilst the soil was being prepared the colony was enabled to import grape cuttings from all parts of Italy, France, Hungary, and the Rhine, through the kindness of Dr. G. Ollino, of Asti, Italy. Those cuttings arrived in good condition and were set out on the rolling hills where the viticulturist in the employ of the company judged they would thrive the best.

The monthly payments continued for five years, each share having paid \$60, or a total of about \$150,000. When the colony was started, grapes were selling in the market at \$30 per ton. When the colony sent the first grapes to market, the price had been reduced to \$8 per ton, which was not sufficient to pay for the cost of growing the grapes.

The board then decided to put up a stone winery. An assessment of \$10 per share was levied, making \$22,500, and a winery, holding 300,000 gallons of wine, with its cooperage, was built. Thus from being farmers only the colonists were compelled to become manufacturers also. As soon as the first wine was made, a sample of it was sent to market, where only 7 cents per gallon was offered for it by the wholesale dealers. Again disaster stared the colony in the face, but fortunately the board of directors and stockholders of the company were men who only became more active when difficulties were to be confronted. Instead of selling the wine to the large San Francisco dealers at ruinous prices, they shipped it in carload lots to New York, New Orleans, Chicago, and all over the United States.

The fine qualities of the wine were immediately appreciated by the dealers and consumers. Instead of being compelled to sacrifice the wine for 7 cents per gallon, they obtained returns of from 30 to 50 cents per gallon, according to the quality. Thus, from being farmers they had become manufacturers, and from manufacturers they were also forced to become dealers, which brought into their control the three branches of the industry.

Year by year sufficient loads of the wines were sold to pay the running expenses and enlarge the plant annually, the balance of the wines being stored in the vaults and kept for aging purposes.

Again the stockholders did not ask for dividends. Every year they issued a report, showing the improving condition of the property, and all were satisfied that the earnings should be added to the improvements, as it was readily seen that the larger the quantity of grapes grown and wine made, the cheaper the wine could be placed on the market and the more successful would be competition with the larger wine houses which had been organized 20 years before them.

They continued improving and adding to the property for 16 years, at the close of which time they not only had the largest dry wine vineyard in California at Asti, with a winery holding 3,000,000 gallons, complete with the best modern machinery and cooperage, but had also acquired at Madera, in the southern part of the State, 1,000 acres of land with vineyard, cooperage, and machinery, where they are making some of the best port, sherry, Muscat, Angelica, and other sweet wines and brandy that are made in the United States.

After 16 years they commenced to pay dividends to the stockholders, thus remunerating them for their long and patient waiting. The value of their shares is now three times over the amount which has been paid, and one can not help but be sorry for the poor laborers who did not embrace the opportunity of deriving a greater benefit from their labors by joining the organizers in taking stock in the company.

As a result of the enterprise the company has during the past 20 years given remunerative employment to over 200 laborers daily. The colony is a settlement with many families, and only yesterday one could count 45 bright children, the oldest being 17 years of age, who were born there. The colony has a school for the children, a post-office, telephone and telegraphic communications, and it is believed to be one of the happiest communities on the face of the earth. Doctors there are none, as they are not required, except in some isolated cases where accidents happen to some of the laborers.

Several of the directors have purchased small tracts of land, where they have erected pleasant country homes and there enjoy the summer vacations, recuperating their health and procuring enjoyment for their families.

In 1897, when the production of grapes by the colony and by the numerous farmers, who had been induced by its example to set their vineyards in the neighborhood, was so large that the cooperage of the colony, although greatly increased, would not contain the juice of this large crop, the directors conceived the happy thought of carving a cistern out of solid rock, measuring 84 feet long, 34 feet wide, and 25 feet high, which was lined with a wall of cement, then made impervious by a coat of paraffin. This is five times larger than the largest wine vessel which has ever been built in the world, and its fame has been written by the press everywhere.

It takes 2 steam pumps 7 days to fill this enormous wine tank, and, as it stands on an elevation above the winery, it is emptied by gravitation through a tunnel with a 4-inch pipe in 4½ days. This tunnel is connected directly with the smaller cooperage in the winery of the colony.

At the possessions in Madera the colony has also quite a settlement, so large that the railroad company was induced to build a special track from the town of Madera to the winery, 4 miles distant. Here the colony has put up the best machinery for grape crushing and wine and brandy making that there now is in the world. In the city of San Francisco the colony has built and now occupies a 5-story building fronting on Broadway and Battery streets, where 1,000,000 gallons of assorted wines are stored, bottled, and shipped to all parts of the world.

The colony now produces, of superior quality, the wines Chianti, Barolo, Barbera, Grignolino, and Marsala of Italy, and also the red and white wines of France and Germany, such as Burgundy, Zinfandel, Carigan, Cabernet, Medoc, Hock, Chasselas, Riesling, Chablis, Sauterne, and Johannisberger, besides all the sweet wines, such as sherry, port, Muscat, Angelica, Madeira, Malaga, Tokay, together with the sparkling Moscato and extra dry Monte Cristo champagnes.

The colony also produces a very superior quality of brandy and cognac, including the famous Grappa, so much appreciated by the Italian people, which is identical in flavor and taste with that made in the mother country.

The wines of the colony have made California known throughout the world for the production of wines of a superior quality, as the colony now ships daily wines in large quantities to all parts of the South and Central American republics, to China and Japan, and also to England, Germany, Switzerland, Belgium, and even to Nice and Cannes in France, where the wines of California are highly appreciated by the connoisseurs of those countries.

That the Italian-Swiss Agricultural Colony has been successful in making as fine wines as those made in any part of the globe is further attested by the medals it has received at the different expositions—for instance, those held in Paris and Bordeaux, France, and Genoa, Asti, and Turin, Italy. The jury at the Italian-American Exhi-

bition in Genoa, Italy, in 1892, in addition to a gold medal, granted the colony a grand diploma of honor, the same as was granted the colony at the National Exhibition in Turin, Italy, September, 1898, for the excellent quality of its red and white wines, and also for its sparkling champagnes.

4. Italians in other parts of California and the Far West.

The Italian-Swiss Agricultural Colony of Asti is not the only example of what Italians have done in the State of California. There are instances of individuals who have been no less successful. One may say that Italians have shown to the world, more than any other nationality, Americans not excluded, the agricultural possibilities of California, which in climate and soil bears so much resemblance to Italy. Just for this reason Italians have found in it the desideratum to carry out their agricultural ideas. Their colonies, even those of the cities, are conceded to be the best models among the Italian colonies of the other States. The same credit must be given to the Swiss-Italians of Canton Ticino of Switzerland, who have emigrated to California. They are not only successful as farmers, but also as ranchmen and dairymen. The truck farmers around the city of San Francisco and other cities of California are mostly Italians.

There is not a Californian valley where there is not a dozen or more Italian farms, fruit orchards, or vineyards, and Italians are employed in large numbers by American farmers.

The list of vine growers of California in the year 1881, when viticulture was yet in an incipient state, gives 111 Italians. Since that year no new lists have been published, but the census of 1901 will undoubtedly show even more creditable figures in favor of the Italians of California.

The last report of the Italian Chamber of Commerce of San Francisco, published in the year 1897, gives 45,625 Italians living in the 56 counties of California, almost all engaged in agriculture, owning 2,726 farms, orchards, vineyards, ranches, etc., and 837 business concerns, with a capital of \$17,908,300. The total capital of agriculturists, ranchers, and business men was reported as \$114,325,000.

The groups of Italian truck farmers in the neighborhood of Denver and Pueblo, Colo., of Salt Lake City, Utah, and of Cheyenne, Wyo., are also worthy of mention. They utilize the land of the valleys, where they can get water for irrigating purposes. On the plateau lands, near Denver, they get the water from artesian wells, with windmills and pumps. They form a prosperous lot of people. They are almost all from the southern provinces of Italy, and the number, though now not more than 300, is on the increase. Originally they were miners or laborers on railroad work. They now have the monopoly of furnishing vegetables to the neighboring cities.

5. Italians of Louisiana and Mississippi.

It is safe to say that the Italians of those States are rapidly dislodging the negroes from the sugar-cane plantations. These Italians almost all come from Sicily, and they are yet coming in large numbers. The Italians having been found reliable at first, are now very much sought for by the planters, who employ them extensively, and who would be at a loss without them. In many cases the plantations are divided into parcels, and each is given to a family to cultivate. The cane is bought by the owner of the plantation at market value, and from the amount is deducted the rent of the land, of animals, and of implements, also the bill of provisions advanced from the store. It would be highly desirable that these Italians, who count about 100,000, should become landowners. Owing to the fact that they are almost all Sicilians, who are very much attached to the kind of food of their native land, the importation of Italian produce to New Orleans from Sicily is very brisk. It seems that in their hard work in the cane fields during the very hot season they find great comfort in drinking wine, therefore the importation of Italian and California wine into these States for their use is very great.

The season of cane cutting is known by Italians as "la zucarata," and each year before la zucarata thousands of Sicilians go from Italy and also from the Central and Northern States, to Louisiana and Mississippi; so there is a fluctuation of Sicilians from Louisiana and Mississippi the latter part of the winter, when la zucarata is over, to the railroad and excavation works of the North, and from the North back again, early in the fall, before la zucarata is begun.

6. The Italian truck farmers of Memphis, Tenn.

In the outskirts of Memphis are located about 50 Italian truck farmers, for whom the community of that town seems to have great respect, judging from reports published by the American and Italian press. They all come from a well-known Italian town of the Valley of the Po, Alessandria, and therefore their settlement is known as

"La Colonia Alessandrina di Memphis." Their pursuit of furnishing Memphis with fruit and vegetables proves profitable, and they are consequently well to do. They have formed among themselves a society of mutual help, known as "La Società di Mutuo Soccorso dei Giardinieri Italiani di Memphis," which is very prosperous. Certainly this example deserves to be pointed out to the Italian cafoni of the American towns, and to those on whom it is incumbent to do something for them in the way of inducing them to go back to agriculture.

7. Italian agricultural colonies of Daphne, Baldwin County, Ala., and of Lamberth, Mobile County, Ala.

These colonies were established by the writer, the first in the year 1890 and the second in the year 1893. Therefore he will let someone else say something about the first one, which is the more important of the two. On pages 360 and 361 of a voluminous "Relazione d'un viaggio d'istruzione negli Stati Uniti fatto per incarico del Ministero di Agricoltura, Industria e Commercio del Regno d'Italia, dal Prof. Guido Cav. Rossati, Regio onotecnico governativo a New York," and published in Rome in 1900, one reads as follows:

This colony which I visited was founded about the year 1890 by Mr. Alessandro Mastro-Valerio, a worthy Italian newspaper man, now manager of La Tribuna Italiana of Chicago, for the purpose of inducing the Italian peasant who emigrates to this country to till the soil, taking them away from the influence of the great American cities, which is often pernicious and demoralizing, and where they live and practice the lowest trades.

He took there about 20 Italian families, dedicating several years of his life to the progress and welfare of the colony. When I visited the colony, as a guest of Mr. Valerio, in 1897, I was able to notice personally how he exercised with much love his agricultural apostolate among these good and laborious peasants, whom he daily educated in the sound principles of rational agriculture. There, in that shady and invigorating pine forest which our countrymen were reclaiming for agriculture, he was guiding and advising them about the planting and the care of the vineyard, while he was experimenting for the United States Department of Agriculture and the State Experiment Station of Alabama. Meanwhile the culture of sweet and Irish potatoes, wheat, corn, rice, tobacco, cotton, and vegetables was going on. At the same time he was studying the improvement of the soil by fertilizing, and gave courage to the colonists to overcome the inevitable difficulties of the first years. Lastly, he was the soul and brain of the colony, which owes to him its present welfare.

Each family possesses from 25 to 50 acres of land, bought at from \$1.50 to \$5 per acre. The soil, which is sandy, with a red or yellow subsoil (siliceo-argillous), is not fertile, but can be easily worked, and with the judicious use of fertilizer produces abundantly Irish and sweet potatoes, corn, rice, oats, tobacco, peanuts, and vegetables, even 2 crops, if one wishes. The vines and fruit trees, which the colonists have planted extensively, according to the system of rows and stakes, develop wonderfully and mature fruit very early, so that the vintage is ended by the 10th of July. The early maturing of the fruit is of distinct benefit, because the grapes can be shipped to the Northern markets, where they are sold as high as 15 cents per pound. The medium production per acre in that locality is about 2 tons. Some vines yield a second crop, as abundant as the first, which matures in September or October.

Each colonist has built his own house out of the lumber of the pine forest. The climate is healthy. The air is purified by pine trees. There is very seldom snow in winter, and the summer heat is tempered by the constant breeze (alises) from the Gulf of Mexico. In order to avoid the damage by frost, which sometimes happens in March, the colonists use fires during the night of damp leaves and grass on which some petroleum has been sprinkled.

For our countrymen who follow the principle of intensive agriculture—viz, that culture by which one can have the maximum crop of the best quality from a small piece of land—these Southern lands are fitted, though poor. Their low price, the great facility for improvement of their physical and productive condition, the magnificent climate, the very pure water, the diversified culture during the year, the cooperative system of consumption and production for which the colony was preparing itself when I visited it, in order to facilitate the sale of products and the obtaining of credit for the purchase of provisions, implements, fertilizers, etc., are coefficients which point to the definite success of the colony of Daphne, Baldwin County, Ala.

In the vineyards, kept by the colonists with the utmost care, I could note the culture of some varieties of European vines grafted on indigenous stock. These grapes are sold entirely for table use. But some colonists had commenced to make wine, and so I could taste the good quality made by Mr. Rossi and the brothers Latini. The wine production of the colony is not very great, but it will be as soon as the young vineyards produce and new ones are planted. The colony possesses a school and a church at Daphne, the county seat of Baldwin County.

I visited each family, so as to inform myself as to their condition. I noticed a certain welfare, and did not hear any complaint worthy of notice. In order to make my visit useful to the colonists, on the evening of the third day I spent in Daphne I gave them a lecture on viticulture, on wine making, on agriculture in general, cooperation, etc., in the large hall of the court-house, which they attended in full force. The newspapers of Daphne and Mobile published articles on my visit to Daphne.

Owing to the fact that after this favorable report of Prof. Guido Rossati, Margherita of Savoy, then Queen of Italy, sent as a present to the Italian church of Daphne some rich and artistic vestments and an illuminated missal, and the minister of public instruction of Italy, two boxes of books, the writer flatters himself that the establishment of the Italian agricultural colony of Daphne, founded according to the principles set forth in this paper, has been appreciated by the Italian Government and by the Queen, who claimed the title of "the elder sister of Italians, wherever they were, at home or abroad."

The writer, founder of this colony, avails himself of this occasion to express public thanks to the United States Secretary of Agriculture for the invaluable help he has very generously tendered him, in furnishing him with seeds and shrubs, advice,

books, pamphlets and other publications. For the same reasons, he wishes to express no less sincere thanks to the director of the Alabama Experiment Station at Auburn, to the manager of the firm of the German Kali Works, of New York and Germany, to the fertilizer department of the Armour Company, Chicago, and to Miss Jane Addams and Mrs. Mary H. Wilmoth, of Hull House, Chicago.

The colony of Lamberth was established with colonists who wished to settle along the line of the Mobile and Ohio Railway in Mobile County. This colony now counts about 12 families of very prosperous people. They are engaged in viticulture, in which they are very successful, and in truck farming. They have built a church and school, and have a railroad station.

8. Colony at Sunnyside, Ark., and Derivative Colonies.

(a) SUNNYSIDE.

No other Italian colony in the United States was started under better auspices than this, and no other colony had so had an end. First we should say that an original mistake weighed upon its destiny, for it was not founded for the purpose of taking away from the cities Italian labor in order to get them to till the soil, but it was formed with peasants brought from Italy—from the Romagna and the Marche—the provinces of the old Papal States, on the shores of the Adriatic.

About 500 families, in 2 batches and at an interval of 1 year, were brought from Romagna and Marche to Sunnyside via New Orleans and the Mississippi River. The expense of transportation might have been entirely saved if the colonists had been taken from the mass of Italian peasants in the American cities, who would have been greatly benefited. This fact confirms the opinion that the best means which there is at hand for the improvement of the condition of the Italians crowded together in American cities—that of sending them to the country to till the soil—is largely overlooked.

The foundation of this colony came after an understanding between Mr. Austin Corbin, the Eastern railroad magnate, president of the L. T. Railway and Terminal Company, of the Reading Railway, and of the Anchor Line of steamboats on the Mississippi River, and Prince E. Ruspoli, mayor of the city of Rome. Princess Ruspoli was a Miss Curtis, of Boston, and the Prince visited this country several times. He became acquainted with Mr. Corbin, who proposed to him a colonization scheme for Italians on a large tract of very rich Mississippi River land in Chicot County, Arkansas, almost opposite Greenville, Miss., and on a river island known as Sunnyside. The island had before been used as a penal colony, and, as the contract had expired, Mr. Corbin thought in 1891 of forming on it an Italian colony. He made this proposition to Prince Ruspoli, then visiting the United States.

Under the influence of this gentleman the required 500 families were enrolled in Romagna by a special agent, Prof. Alex. Oldrini, of New York, who made the trip there purposely. They were sent to New Orleans under the special protection of the Italian diplomatic and consular authorities, who had interested the American authorities of that port in them, and from there they were sent to Sunnyside, on the steamers of the Anchor Line, owned by Mr. Corbin. During the trip special care was given to the comfort of the colonists. No less care was given to welcome them at Sunnyside, where they found everything ready to commence work at once, in the fall of 1895.

The soil, of fabulous fertility, as is all the soil of the Mississippi Valley, was ready to be planted. Agricultural implements, draft horses, seeds, houses, stores, warehouses, gins, presses, carts, a railroad, a steamer coasting the island, were all ready for the planting, care, and gathering of the cotton crop, its baling and transportation. The cotton was afterwards bought at market price by Mr. Corbin. There was also a school, taught by 12 Selesian nuns, and a church, of which the Rev. Father Bandini, purposely called from Albany, N. Y., was the titular. Sunnyside had also a postal and a telegraph office.

Twenty acres of land, with a good house, was allotted to each family at a fair price, and full credit for each was opened at the Sunnyside store, also the property of Mr. Corbin. With such a splendid beginning the colony gave promise of a high prosperity, but unfortunately malaria soon began to decimate its members. Mr. Corbin had promised the Italian diplomatic authorities at Washington, and through them the Italian Government, that he would make the colonists comfortable, and from the vast improvements he commenced at Sunnyside in the line of drainage, sewerage, and sinking of artesian wells to get pure water from the substrata, which undoubtedly would have improved the sanitary condition of the colony, he certainly was keeping his word.

But his death in the year 1896, in his park in the Adirondack Mountains, caused by a fall from his stage coach, put an untimely end to all this. The estate which he left could not undertake the responsibility of continuing his projects until all

the affairs pertaining thereto should have been settled, and this required a great deal of time.

The alarming increase of mortality among the colonists (130 deaths occurred in two months) forced a majority of them to abandon the colony in 1897 and 1898. Only 40 small families and single persons remained. Many of the families went back to Italy; others went to Brazil, South America; Alabama, New Orleans, and the North. The remaining families went to form the colonies of Tontitown, Ark.; of Montebello, near St. James, Phelps County, Mo., and of Verdella, also in Missouri. Owing to the fact that there is before the legislature of the State of Arkansas a bill to buy the land at Sunnyside, to make it once more a penal colony, the probability is that the Italian families remaining at Sunnyside will move elsewhere.

If Mr. Corbin had lived his sanitary projects would have been carried out at Sunnyside according to the perfection which science has reached, and we venture to say that what is now done in the Roman Campagna in regard to the prevention of malaria, by guarding against the anophales mosquito, which it has been ascertained spreads malarial fever through germs injected through its bite, would have been done for the colonists at Sunnyside, and this would have been the most prosperous colony of the United States.

(b) TONTITOWN, ARK.

The Rev. Father Bandini, rector of the Sunnyside church, as soon as the exodus of the members of the colony commenced, thought it necessary to found another colony, where they could continue their agricultural pursuits instead of going back to Italy or to live in the towns. Therefore he gathered a certain number of colonists who were ready to follow his advice and with whom he discussed the plan. A committee was appointed to visit land offered to them by the land department of the St. Louis and San Francisco Railway and report. The report was not unanimous as to the adaptability of the land to their use. Some of the committee liked it and others did not. Nevertheless, about 60 families took the favorable side of the report and went there to settle. They formed the colony of Montebello, Mo. Those who took the other side looked for another place, which they found near Springdale, Ark., and settled to the number of 50 families with Father Bandini, founding in the winter of 1898 the colony of Tontitown, named in honor of Henry Tonti, the explorer and companion of La Salle. Tonti founded in 1686 the first Arkansas settlement and military fort, known as Arkansas Post.

There is no doubt that of the three colonies that of Tontitown is the most advanced and prosperous. The land is better than that of the other colonies and the continuous presence of the Rev. Father Bandini, who acts as a religious and civil apostle, on account of the intense interest he takes in the welfare of his countrymen, is a guaranty of success. He directs intelligently the minds and the hearts and the work of the colonists. During the first year he held his people together in spite of adverse circumstances—a most killing frost, a destructive cyclone, and the prejudice of the neighboring Baptists and Adventists. All reports show the colony to be a success, with a splendid future. Father Bandini teaches the school and ministers at the church, both built through the efforts of the colonists. The church, of which we have before us a photograph, is a very beautiful building.

(c) MONTEBELLO, MO.

In regard to this colony it must be said that the topography and the quality of its soil, the lack of homogeneous direction, and the rather scanty means of the colonists, impaired its progress at first. The men have been compelled each year to go and work elsewhere in order to earn some money and to return to the colony at the end of the work. Nevertheless, it bears marks of decided progress, which gives promise of an increase. The persistence of the Italians, their diversified, intensive ways of agriculture, their frugality and thrift are bearing inevitable fruit.

(d) VERDELLA, MO.

This colony is composed of no more than a dozen families, and it is in the same condition as the colony of Montebello.

These three colonies carry on general farming, though the tendency is toward wine and fruit culture, truck farming, and small grain, for which Italians have special adaptability. Of course, so far to the South, cotton is king, being the staple which brings ready money. The colonists therefore pay to his royal majesty the same homage that Southern people do, by cultivating it as much as possible, especially since during the last few years the price has been highly remunerative to the planters.

9. Miscellaneous.

Questions put to the Italian consuls, consular agents, newspapers, through advertisements, to presidents of Italian societies, business firms, agricultural bureaus of States and Territories, officials of counties where mining camps composed of Italians are located, etc., do not give definite information regarding the number of Italians engaged in agricultural pursuits. All report, however, that in the neighborhood of the American cities and mining camps there are a good many Italians engaged in truck farming and in vine growing. A strong contingent of them are on Long Island, Staten Island, in the State of New Jersey, in the Delaware peach belt, in Pennsylvania, Washington, Baltimore, in the large truck-farming districts of Norfolk, in the wine-producing belt of the States of New York, Pennsylvania, Ohio, and on the southern shore of Lake Erie—even on the islands of that lake where wine is produced.

The advent of the citrus culture in Florida caused some importation of Italians from Sicily for the packing and culture of the fruit for market. A good many of them have become landowners and cultivate on their own account, and are, with the other Florida planters, victims of the frost.

As to Italians in New England, I will quote the following answer to a letter of inquiry: "In answer to your favor of —, I beg to say that from inquiries made in order to furnish you the requested information, I have found that there are very few Italian farmers in the New England States, owing to the lack of capital, the nature of the soil, and the rigidity of the climate, which makes it hardly remunerative. I do not think that their number is on the increase, for many reasons, among which is that the Italian peasants are not willing again to follow a pursuit which at home has caused them only hardships and privations."

BOHEMIAN SETTLEMENTS IN THE UNITED STATES.¹

There are proofs that the first Bohemian emigrants must have come soon after the close of the "Thirty years' war" (1618-1648), caused by the revolt of the Bohemians against Ferdinand II, who violated their religious liberties, and finally, with the assistance of nearly all of Catholic Europe, succeeded in crushing the first spark of religious freedom, and forced the Protestant and patriotic elements to seek new homes. Many crossed the "deep waters" and found homes among their Puritan and Huguenot co-religionists in America. The strongest evidence of these early emigrants exists in Cecil County, Maryland, where are to be found many descendants of the well-known Bohemian emigrant, Augustine Herman, the founder of Bohemian Manor, who came to what was then New Netherlands in the year 1633.

Again, after the revolutionary epoch of 1848, exiled patriots and restless students hurried to the shore of this country. The first Bohemian settlements took root as early as 1850 in St. Louis, Milwaukee, New York, Chicago, and in 1855 in some parts of Texas. These people were mostly students, professional men, and wealthy peasants. Having arrived here without knowledge of the English language, they were forced to give up their professions and settle on farms. Wisconsin, Iowa, Missouri, Texas, Minnesota, Illinois, and California claimed the first emigrants. To these new States they brought the knowledge and industry which they were taught in the overcrowded Bohemia. The virgin soil under their cultivation soon began to yield rich harvests; the dugouts and log-cabins made room for fine cottages and luxurious houses; letters describing this prosperity and longed-for freedom were sent to the old home to be read like fairy tales of Hans Andersen, and everybody dreamed of this new Eldorado.

Conditions in Austria were becoming more and more unbearable when the Austro-Prussian war (1866-1871) broke the last thread of patience and endurance, and all those who still cherished any ideals of religious freedom and national independence and who owned any property sold out, usually to the Jews, and migrated westward.

By this time the German element had become more predominant in this country, and the Bohemian skilled laborers usually being able to speak the German, besides their own language, found that the skilled laborer had here a splendid opportunity. The result was a heavy flow of laborers. The cigar makers from Kutna Hora found in New York a great demand for their trade, remained there and formed a settlement renowned as a center of cigar makers. This settlement annually received additions of other unskilled compatriots, who were at once taught the work, which was hard and in constant demand.

After the Chicago fire in 1871 the rebuilding of the city drew another stream of skilled laborers from Bohemia. Tailors found that Chicago was a good location for custom tailoring, and so Chicago became their destination.

¹ Contributed by Josefa Humpal Zeman, editor of *Zensky Listy* Chicago, Ill.

The settlements were formed by people from the same city or village, one helping the other until whole families and their relations were over. The oldest son or daughter would often come first and earn enough money to pay the way for another member of the family.

To the luring advertising of steamship and railroad companies can be given a large part of the credit for the emigration in the eighties, almost to the time of the World's Exposition in Chicago in 1893. This caused a great boom, especially to the real-estate interests, where old friends soon found work for the newcomers. The peasants were put to day-labor occupations, the tradesmen taken into shops, and older boys and girls were sent to tailoring, cigar making, and to factories.

In each settlement arose various patriotic, social, and benevolent societies, the most popular among these being the building and loan associations.

The characteristics of the Chicago settlement may also be seen in to the settlements in Cleveland, New York City, Milwaukee, Omaha, St. Louis, Baltimore, and Cedar Rapids, Iowa. Yet each colony has its distinct occupations. The Bohemians of New York are mostly cigar makers. Those of Cleveland are engaged chiefly in building trades, the Standard Oil works, foundries, etc. In Chicago they are engaged in tailoring, lumber work, and building trades; in Cedar Rapids, in building trades; in Sinclair, in the stock yards; in Burlington, in railroad and car shops.

Some Bohemians work with their Slovak neighbors in the mines of Pennsylvania, and a large portion have settled on farms; and here we come to another interesting feature of Bohemian life.

The Bohemians, like all Slavs, are very fond of the soil, and from time immemorial were considered a rural people. They are fond of home life, and one would naturally suppose they would prefer the farm to the city any day. Yet this has not been the case in the United States, and although there are many thousand Bohemians settled on farms the majority prefer the city. The reasons for this are several: First, to settle on a farm requires capital with which to buy farming implements; second, the cost of transportation from the seaports is too great. Then, the life of an American farmer is very lonely in comparison with the ideal village life of Bohemia, where all have grown up from childhood together. In Bohemia are to be had the traditional holidays, feasts, processions, national music, and games, which make the life of a peasant so happy. It is true we have the newspaper, with the rural delivery, to break up the monotony (and Bohemians have over forty newspapers in their language in the United States), but that in itself is one of the elements that sows the seed of discontent, telling as it does with American dash of the life in the large cities. Bohemians love music and they long for friends and society, and that is another reason why they prefer the life of the city day laborer, with the hard toil in lumber yards, to that of a prospering farmer.

There have been several efforts made to form agricultural colonies, but all have failed. The first cooperative colony (Rys) was formed in June, 1897, by a board of energetic and intelligent workmen. It was after the distress of 1894, when so many laboring people suffered from lack of work following the strike of cutters and tailors. The progressive workmen decided to form a society which was to raise a fund by weekly payments, the first fee being \$50, and after that each member was to pay a certain amount per week. They succeeded in raising enough to purchase an old plantation in Virginia. The reason for choosing this State was that it was near the markets, and transportation would not cost much. With the assistance of various friends the first thirteen families left for the colony. Those remaining behind were to send weekly contributions until harvest time. They were all to work as equals, each one considering the good of the other. Soon trouble arose; no one wanted to consider the others' advice; jealousy arose among the women, followed by lack of desire to work by the men. The Chicago friends failed to send their contributions. Soon all grew impatient, and one by one left the colony and moved to Baltimore or New York, and the colony disbanded.

Individually, however, Bohemian farmers have done well. Some in Minnesota and Nebraska have started cooperative mills and cheese factories. The most prosperous farmers are to be found in Iowa, Nebraska, Texas, and Wisconsin. The earliest settlements were in Wisconsin in 1850, in Texas in 1855, in Minnesota in 1854, and in Nebraska in 1868. These settlements were made usually near the rivers, and the majority of those in the Western States had migrated from some other State.

Only in rare instances did the Bohemian farmers come in as farm laborers. The first farmers brought with them from Bohemia money enough to buy land at once. Many of these early settlers had sold large estates in Europe and brought as much as \$10,000 with them. These not only bought farms for themselves, but helped others by loaning them money. Those who were not so well-to-do brought at least \$1,000, and with this bought cheap lands. As a rule the Bohemians bought uncultivated land, cleared the forests, and by skillful methods of agriculture developed the land into prospering farms. Such instances may be found in Caledonia, Racine County, Wis.; Ely, Iowa; Yankton, S. Dak.; Wilbur, Schnyder, and Abie, Nebr. The

Bohemian settlements grew as the children matured, each son receiving a portion of the land or an entirely new farm.

The people settled mostly in groups, and only in rare instances did they mingle with other nationalities. Where, however, they have come into strange colonies they prosper and soon buy out the others. In exclusively Bohemian localities, as, for instance, in Texas and some parts of Nebraska, like Abie, where the settlements are almost exclusively Bohemian, they retain their Bohemian habits, but where they are near other nationalities they Americanize very rapidly. The Bohemian farmers are good grain and fruit growers and great lovers of trees. Each farm is surrounded by a thriving orchard, and every corner of the land is utilized. They are hard workers, and have little faith in schemes to save work; they give the same amount of energy to the virgin soil of America as they did to the crowded and much-used soil of old historic Bohemia. The result is that their farms prosper and they grow rich.

It must not be inferred that the Bohemian farmer does not believe in machinery, for he does; only he does not believe that the sun and rain alone will do the weeding and cultivating.

There is one new industry in the United States which should afford the Bohemian immigrant a great inducement to leave the overcrowded city, and that is the sugar-beet industry, which, especially in the arid lands of Colorado, is taking strong hold. The sugar beet is one of the great products of Bohemia, and many Bohemian immigrants are expert beet growers. If these could be induced to settle in the neighborhood of Rocky Ford or Holly, Colo., they would help to build up what promises to be a very prospering industry. There are several features of this kind of farming which would be especially advantageous to the Bohemian farmer:

First, he knows how to grow the beet, and as the agriculturists that are teaching the farmer are mostly Europeans, they would teach exactly the same methods as the Bohemian farmer used in Europe.

Secondly, the farms are small, another feature to which the Bohemian farmer is accustomed to from Europe.

Thirdly, on account of the small size of the farms the farmers are brought closer to each other, and so form small villages, with the greater social life to which they were accustomed in Europe.

Fourthly, the factories are in the vicinity, and offer a market and employment to him.

Fifthly, the land is cheap and ample time is given for payments.

At present the tendency of Bohemian immigration is to settle in the large city settlements, and the hard times which we have just survived have checked almost all immigration. Besides, the Austrian Government makes it much harder for a peasant to sell his land and move. The European papers are constantly publishing reports of the "hard times" in America, and so only those come who have relatives here and some prospects. Then also, from the fact that most of the good lands are taken up and farms are much more expensive, there remain fewer inducements for the immigrant to go to the country districts. In the city there is always more opportunity to receive employment and assistance in case of need from the older settlers. If the Government would offer some assistance to immigrants in getting out of the city there is no doubt that many would go.

Bohemians dread to become subjects of public charity, and hence prefer to go where there is some prospect of becoming self-supporting and independent. There is no doubt that fully one-fourth of the city populations would prefer the life of a farmer to that of a day laborer, but have not the means to go the country. It would be better for them and better for the country if the rural people of Europe could locate on farms. City life is extremely dangerous to the second and third generations. The peasant, raised in the open air, hates the close tenements, crowded streets, and filthy alleys. The walls of the house stifle him, and so he is forced to stay outdoors, where he forms his companionships. The saloon becomes his social center, where he can idle away the long and tedious hours of enforced idleness or the long evenings. The children romp in the streets also, and not having playgrounds where they could exercise they find their chief pleasure in reading detective stories and in fighting. They are soon taught that obedience to parents, respect to old age and law, is nonsense. Instead of turning their earnings into one treasury they pay board to the "old folks" and spend the rest as they choose in cheap theatres and music halls. This is the condition of the ordinary peasant class who are the day laborers of the city, and form the lowest stratum in the foreign colony. The professional classes give their children better education, and so throw them into relation with the better class of Americans, which saves them to some extent from the corrupting influences spoken of.

This evil state of affairs would be impossible in the country, where work takes up all the extra energy, and the outdoor life affords conditions to which the people are accustomed. In Europe the laboring classes have their labor unions, and the young apprentices have their Sunday trade schools. The communities are small, and each

knows the other. City life, under present conditions, with no playgrounds, no neighborhood centers, no public reading rooms, no manual training schools in the foreign districts, has certainly most distressing effects on the second generation.

If farms were smaller and the houses closer, the towns formed on the style of European villages, with their social aspect, there is no doubt that the country would have the most wholesome influence on the foreign population.

C. FINNISH COLONIZATION.

Political troubles at home, as well as a desire to better their economic condition, have been sending Finns to this country in considerable numbers during the past few years. They are not inclined to linger in cities; a large proportion go directly to country districts, especially to the Northwest, on first arrival. Those who remain in the city are ready at any moment to make their way out of it if work is hard to get.

The following letter from the general agent of a steamship company engaged especially in transporting Finns tells of special efforts he has made to place Finns in agricultural districts, and is of particular interest as showing them in a part of the country which would be supposed to be not particularly well adapted to them. He writes:

I would say, relative to the Tennessee colony of Finns, that it is located in Hickman County and promises satisfactory results.

I have for a long time been much interested in locating Scandinavians advantageously, and have tried several places, giving them up when found lacking in any of the requirements for the happiness and health of settlers. The Hickman County lands I took a little over 2 years ago after very careful examination, and some 8,000 acres have been taken up by settlers, although I had no desire to hurry sales until results of the first settlers' efforts could be seen. The lands are particularly adapted to raising grapes and tobacco, and with cultivation of these, Scandinavians are naturally unhandy; but the location is healthy, and the settlers there, all of whom have purchased land, are contented, so that by the fall a good many Scandinavians will know of it and quite a number will no doubt buy farms.

These buyers have all been some time in this country, and the little money they have has been made here. Few of them are from cities; most of them are from the Northwest, where they have been working. Newly arrived Finns and Scandinavians rarely have any money other than that required by the United States laws. Sometimes they bring \$50 or \$100, but they come here to work, and it is only after they have become familiar with things here and have put by some money that they finally settle down to stay. Of well-to-do farmers in their own country we can not recall any who have come here, and even with political troubles it is doubtful if there will be many of this class coming over. But, as I have said, there are a good many Finns and Scandinavians already in this country who are desirous of settling if they can do so with surety of making money, and I have given much time to looking for healthy suitable places for them, having had lands offered in nearly all the States.

Scandinavians have heretofore preferred the Northwest, but the Central and Southern States to-day, in my opinion, present greater inducements for them to settle, as land is much cheaper, and they can raise almost everything, and many localities are healthy, while land is now high in price in the Northwest, farming there must be conducted on a grand scale to pay, and crops are necessarily limited to cereals. Still, as some Scandinavians will only settle there, I have just arranged for a large tract of land in Wisconsin, so that they might have a choice, and also have gone as far South as South Carolina, where we propose to have a settlement, having found a thoroughly healthy and desirable location for them. From what I have written it will be seen that the class who are buying land have comparatively little money and have to be given plenty of time to pay for the farms they buy, and the Central and Southern States, where the cost of a house is very little and the winters do not demand very much clothing, are advantageous to them, now that the railroads have made it possible for the farmer always to have a market for his produce.

D. DISTRIBUTION OF JEWISH IMMIGRANTS.

To learn what can be or has been done to get this particular class of immigrants out of the cities into country districts is of particular interest and importance, as they show perhaps a stronger tendency than any other class to gather in big cities, and are arriving, year after year, in such numbers as to make that tendency a matter of serious moment to city communities. One reason for this tendency is to be found in the conditions under which emigration takes place. The bulk of Jewish immigration to-day is from Russia, Austria, and Roumania, and, emigration from these countries having been practically forced upon the Jews, they come here in denser and more helpless masses, with less impetus to carry them beyond the port of entry where they are landed than a people set in motion by the economic motive only.

Another reason is that, whether from conditions under which they have been forced to live, or from some inherent characteristic, the Jews are not to-day an agricultural people, but follow, in the main, commercial and industrial pursuits, which are carried on to best advantage in cities or large towns.

Not a little has been done, however, in the way of agricultural settlement by Jews, either on their own initiative as individuals, or in self-sustaining colonies or companies, or with the assistance of more prosperous coreligionists.

Colonization on farms by Russian Jews began as early as 1880, with a group from Odessa who came over with the express intention of going into farming. About 7 families and 45 single men made up the company, the single men being mostly university students imbued with ideas of communism. When they landed in this

country they sent about 40 of their people to the different States as farm help, to learn the farming business, leaving a committee in New York to go out and find suitable land. After several months such land was found in Oregon, near Glendale Station, and 25 people—4 families, the rest single men—were sent out as the first settlers. They bought about 760 acres for \$7,800. They were aided in the matter of railway fare both by the management of the railway company and by some societies in New York City. They were also aided by the advice and care of a committee. During the first year they met with misfortune. When they first arrived a good market was open for their products. Provisions were very high because a railroad was being built through the place, but after the colony had settled there the building of the railroad was discontinued and the price for provisions fell. For instance, a ton of hay formerly worth \$50 fell to \$7, so that the immigrants lost a large part of their original investment. The immigrants then made an agreement with the Southern Pacific Railroad Company to chop 2,000 cords of wood at \$3.50 a cord. They kept their agreement and made first-class woodchoppers, even though most of them were students. The colony was conducted on a communistic basis. As years went on, though they made encouraging progress, the immigrants felt that farming was not a good business. There were no facilities for education and no communication with civilization, and for the future there was just the hope for making a bare living. After three years 12 families left, and before the fourth year was over all had removed, going in a group to California and finally back to New York. The colonists went into other occupations for the most part. One is now a chemist, one is a druggist in New York City, one is an engineer, two are lawyers, two are dentists, one is superintendent of a hospital, and one returned to Russia, where he is now a merchant.

About the year 1881 a company of about 25 families went to South Carolina and located there. They stayed about a year, but found that the climate did not agree with them. They suffered from fevers and other diseases peculiar to the locality and finally decided to remove to North Dakota, on Government lands. There they remained about four years, but from lack of means could not hold out, and left. It is not known that any remained there. This colony was not a communist colony. There was, however, a communist colony settled in North Dakota, called Baclachin, which was kept up for 3 or 4 years and then disbanded.

In 1882 two colonies were organized in southern Kansas, called Lasker and Montefiore, with about 30 families in each. They worked at a considerable disadvantage because of the dry climate. Up to 2 years ago there were remnants of these colonies left there, but they have since disappeared.

In 1881 a colony of Russian Jews settled in Minnesota, numbering about 50 families. They held their farms for 3 or 4 years and then gradually left, as they had met with ill-success through the ravages of grasshoppers. A few still remained as late as 1889.

In 1887 or 1888 an assisted colony was established in North Dakota at a place called Painted Woods. The assistance given consisted in advancing them money for the purchase of lands at a lower rate of interest and on easier terms than they could have gotten it elsewhere. This colony gave out, but members of the colony went, individually, to another part of North Dakota and are now doing well in agriculture. They are in the Devils Lake region.

Difficulties with agricultural colonization for the Jews in the northwest are that the climate is too severe and the capital required too great. Where the climate is severe and the summer short, enough money has to be made in a brief time to carry the family through the winter. If they are without capital, the failure of a crop in any one season would mean the failure of the entire enterprise.

In 1882 the first of the now well-known Jewish colonies in southern New Jersey¹ was started by the Hebrew Aid Society, of New York—a society formed to give assistance to immigrant Jews. This association purchased about 1,100 acres of land in Salem County, 6 miles from Vineland, and placed there 250 persons, men, women, and children. The society allotted land in tracts of 15 acres to each family, and deeded these farms to the occupants, charging \$150 for each, and giving a term of 33 years for payment, without interest. The enterprise was taken over in 2 or 3 years by an organization known as the Alliance Land Trust, and the settlement was named "Alliance."

The families had to be supported through the first winter; but from the time farming operations began the following spring improvement in the general condition of the people was steady.

The Hebrew Aid Society in the same year located 6 Jewish families at the place now known as Rosenhayn.

In 1883 a body of Russian Jewish immigrants formed a settlement on their own account at Carmel, the village near which Rosenhayn was established. This colony

¹For a full account of these colonies see "The Jewish Colonies of South Jersey," Bureau of Statistics of New Jersey, 1901.

knows the other. City life, under present conditions, with no playgrounds, no neighborhood centers, no public reading rooms, no manual training schools in the foreign districts, has certainly most distressing effects on the second generation.

If farms were smaller and the houses closer, the towns formed on the style of European villages, with their social aspect, there is no doubt that the country would have the most wholesome influence on the foreign population.

C. FINNISH COLONIZATION.

Political troubles at home, as well as a desire to better their economic condition, have been sending Finns to this country in considerable numbers during the past few years. They are not inclined to linger in cities; a large proportion go directly to country districts, especially to the Northwest, on first arrival. Those who remain in the city are ready at any moment to make their way out of it if work is hard to get.

Scandinavians have heretofore preferred the Northwest, but the Central and Southern States to-day, in my opinion, present greater inducements for them to settle, as land is much cheaper, and they can raise almost everything, and many localities are healthy, while land is now high in price in the Northwest, farming there must be conducted on a grand scale to pay, and crops are necessarily limited to cereals. Still, as some Scandinavians will only settle there, I have just arranged for a large tract of land in Wisconsin, so that they might have a choice, and also have gone as far South as South Carolina, where we propose to have a settlement, having found a thoroughly healthy and desirable location for them. From what I have written it will be seen that the class who are buying land have comparatively little money and have to be given plenty of time to pay for the farms they buy, and the Central and Southern States, where the cost of a house is very little and the winters do not demand very much clothing, are advantageous to them, now that the railroads have made it possible for the farmer always to have a market for his produce.

D. DISTRIBUTION OF JEWISH IMMIGRANTS.

To learn what can be or has been done to get this particular class of immigrants out of the cities into country districts is of particular interest and importance, as they show perhaps a stronger tendency than any other class to gather in big cities, and are arriving, year after year, in such numbers as to make that tendency a matter of serious moment to city communities. One reason for this tendency is to be found in the conditions under which emigration takes place. The bulk of Jewish immigration to-day is from Russia, Austria, and Roumania, and, emigration from these countries having been practically forced upon the Jews, they come here in denser and more helpless masses, with less impetus to carry them beyond the port of entry where they are landed than a people set in motion by the economic motive only.

Another reason is that, whether from conditions under which they have been forced to live, or from some inherent characteristic, the Jews are not to-day an agricultural people, but follow, in the main, commercial and industrial pursuits, which are carried on to best advantage in cities or large towns.

Not a little has been done, however, in the way of agricultural settlement by Jews, either on their own initiative as individuals, or in self-sustaining colonies or companies, or with the assistance of more prosperous coreligionists.

Colonization on farms by Russian Jews began as early as 1880, with a group from Odessa who came over with the express intention of going into farming. About 7 families and 45 single men made up the company, the single men being mostly university students imbued with ideas of communism. When they landed in this

The historian of the colony says:¹

The industries are somewhat hampered by the inability of the manufacturers to obtain a sufficient number of operatives to increase their output. The workmen apparently prefer the sweat shops of New York and other large cities with their noisome air, confined quarters, and reeking filth of their surroundings to the commodious, well-lighted, thoroughly ventilated factories and the free air of the open country. One reason why it is so difficult to get these people away from large cities lies in the fact that although the manufacturers have labored earnestly to induce them to come out into the country to work, it has been found impossible to divest their minds of the fear that the employment will not be permanent, and they may be thrown out of employment without means and far from their friends and associates.

It has been found necessary to introduce industrial enterprises into the other colonies also; and it seems to be pretty generally agreed upon that the assisted colony as a purely agricultural affair is not a success. It is said that even of the families still engaged in farming in the south Jersey colonies, one or more members are employed in other occupations; that the farms are not and cannot be self-sustaining, and that without constant help from the corporation they could not be kept up in the fine condition in which they now appear. Aside from the question of success in farming, was, however, the question whether these assisted persons were willing to work. The plan was a good test of this and proved successful; they showed their willingness to work very thoroughly.

Another plan tried by the Baron de Hirsch fund for getting immigrants into the country is to assist individuals by offering information and advice as to lands to be purchased and some financial aid in securing them. This work, and also that of conducting the colonies just described, is carried on by a department of the Baron de Hirsch fund known as the "Jewish Agricultural and Industrial Aid Society." An agent of this society is sent out to examine and report on farm property, which is then, if the report is favorable, brought to the notice of persons wishing to buy farms. When the would-be purchaser has selected his land he is aided by the fund with a loan secured by a second mortgage on the property at low interest and with payments on the principal deferred as may be necessary to make conditions possible for the farmer. The society has found it necessary to require, however, that the colonist himself shall invest sufficient money of his own in the enterprise to have a considerable equity in the property. If the colonist has not invested a fair amount of money of his own he is likely at the first little discouragement to leave the place and default on his payments.

Especially favorable opportunities for the settlement of the persons assisted have been found on the so-called "abandoned farms" of New England. The society has aided two or three hundred families to secure farms in this region. There are a large number of these families in Connecticut, especially around New London.

The Russian-Jewish farmers in Connecticut have succeeded especially well on two accounts. In the first place, the farms that they went to were already in a state of cultivation; what they could produce and the conditions of the market were known beforehand. In the second place, it is a good neighborhood for summer boarders, and thus affords a good market for the farmers' produce. These individual farmers seem to be quite successful. Among those assisted by receiving loans only three cases of default in payment of mortgage in the last 2 years have been recorded.

The general conditions surrounding the Connecticut colony are very favorable. Persons who went there were received very kindly in the neighborhood, mingling freely with the American residents, and receiving considerable friendly advice and assistance from them. There are in all about 200 Jewish families scattered through the State of Connecticut making their living as farmers and being aided considerably by working in tailor shops in their neighborhoods during the winter. Among these are a number of families at Colchester, who moved there of their own initiative, without assistance from the fund. The rubber factory then in operation there gave to the Russian farmers a market for their produce.

There are a few families in Maine. Two years ago some were sent and are fairly successful.

There are also individual Jewish farmers known of in Spring Valley and Suffern, N. Y., and in New Brunswick, N. J. They have been especially successful at dairying. That and truck farming seem to be the best lines of work for them.

It is to be noted that, in general, newly arrived immigrants do not get the advantage of this means of assistance in reaching the country districts. In the first place, they do not come here with money enough. Another difficulty is that very recent arrivals not being able to speak English, could not get along well in rural districts where nothing but English is spoken.

In general, the applicants for these farms are men who have made a little money in the city. A great many of them are tailors, who have saved up from \$50 to \$1,000 in their occupation, and secure the additional money needed to take up the

¹ "The Jewish Colonies of South Jersey," p. 22.

farm on loan from the society. So that when business is unusually prosperous, this class of people are not so likely to stop the work they are engaged in to go into agriculture, and the work of loaning money for the taking up of abandoned farms will slacken, as it has within the past 2 years, on account of the great demand for labor in the cities under the present conditions of business prosperity.

Colonization in New England has been the most successful of any, but for the reasons above mentioned it seems to be about at an end for the present.

The society is now looking into the possibilities of getting newly arrived immigrants into farming, but their plans are not yet sufficiently formulated to be described. They are now trying a plan of sending the newly arrived to Woodbine. These are taking land, not as owners, but as tenants, under the supervision of the superintendent of the agricultural school. They are thus enabled to have some instruction in agriculture as applied under American conditions that could not be given to them elsewhere. Coming into a new country, the newly arrived immigrant has under ordinary circumstances no one to turn to for advice, and this stands in the way of his success.

Both because purely agricultural removal presented such difficulties and because in any group of people there would always be some who could not be provided for in that way, plans for industrial removal have been inaugurated.

This work began in the summer of 1900, when political troubles in Roumania were sending Roumanian Jews to this country in large numbers, and the destitute condition of the Roumanian immigrants stranded in New York was such as to call forth the sympathy and interest of their coreligionists, who formed a private committee to undertake measures for their relief.

The chief means of relief planned for by the committee was to find employment for the Roumanian immigrants in other parts of the country. The secret Order of B'nai B'rith, with the aid of its local chapters throughout the country, assisted in this work, which was found so successful that it seemed well to extend it further. The Baron de Hirsch fund took it up, making it a branch of the Jewish Agricultural and Industrial Aid Society, under the name of the Industrial Removal Society, and has extended its benefits beyond the Roumanian Jews, for whom it was originally intended, to Russian and Polish Jews as well.

Their method of placing immigrants is, briefly, as follows: Persons desiring to remove from the city make a written application, which is kept on file at the office of the society, stating, besides names and addresses, date of arrival in this country and in this city, the language spoken, their ages and occupations. An agent resident in the city investigates as to general reliability and responsibility each case presented. If this report is favorable in any given case, the name is placed on the list of those for whom positions are to be sought. A traveling agent takes these lists and, going through the country, speaks in different towns where there are bodies of Jewish people, to interest them in the work and secure their cooperation in it. The list that the agent has shows the occupation of the applicants for removal, and from this list those who will cooperate in the work are to select the number of persons wanted of the occupations given and to agree to find places for them. For instance, a prominent Hebrew in a Southern town will agree to take 4 blacksmiths; a rabbi will receive and place 2 shoemakers, and so on. The society then sends the number required, paying all expenses of transportation of the persons sent out, but after they reach their destination being under no further responsibility with regard to them.

It is stated at the society's office that about 2,500 persons were assisted in this way from the beginning of the work in August, 1900, to the spring of 1901.

Of those already helped the greater number are men who have left their families in the old country. Only about 30 or 40 families so far have been assisted. When families are to be helped, the head of the family is sent on first to see if he likes the place he is sent to; if he does, the family follows. It is said that little dissatisfaction is expressed either by those who are sent out or by those who receive them, because, in the first place, the persons sending for labor are carefully selected, and, in the next place, the families to be sent are thoroughly investigated.

The following list of occupations of the applicants that happened to be on the roll of the society on the day when the list was copied, by the courtesy of the officers, or presentation in this report is interesting, as showing a greater variety than is usually attributed to the Jew. On the list were: Bakers, barbers, bookkeepers, blacksmiths, brass workers, butchers, buttonhole makers, an egg candler, carpenters, chair makers, cutters, drivers, druggists, a dyer, farmers, finishers, glaziers, hat makers, iron workers, jewelers, locksmiths, machinists, a mason, operators (sewing machine), painters, paper hangers, peddlers, a photographer, a pipe maker, lumberers, pressers, printers, a quilt maker, shoemakers, silversmiths, tanners, tinmiths, trunk makers, upholsterers, waiters, watchmakers, weavers, a wine maker, a wood turner. Of these perhaps the most numerous were: Barbers, butchers, carpenters, cigar makers, drivers, glaziers, locksmiths, machinists, operators, painters, saddlers, shoemakers, tinsmiths.

The great variety of these occupations, in contrast to the general idea that a Jew

is always a tailor or a peddler, is accounted for partly by the fact that a large proportion of the Jews who are tailors over here were not tailors in their own country, and in giving their occupations for this list they give those originally followed; partly by the fact that the Roumanian Jews, who have made up the bulk of those helped, differ in their industrial characteristics from the Russian Jews. The Roumanians comprise a merchant and trading class, and a laboring class composed of vigorous, hardy manual workers. They are both skilled and unskilled laborers in occupations requiring physical strength, and are able to adapt themselves more easily than the Russian Jew to the industrial conditions prevailing in the average American community.

Even more interesting than the list of occupations, perhaps, is the list of places to which applicants have already been sent. This list was copied from a map in the office of the society, on which each place which had received applicants was marked in red. The impression to the eye was most vivid, that these newly arrived immigrants had been scattered to practically every part of the country. No corner or section of the map was without its red mark indicating the presence of persons sent by this society.

The list of places is as follows:

Massachusetts: North Adams, Pittsfield, Holyoke, Springfield.
 Rhode Island: Providence.
 Connecticut: Hartford.
 New York: Troy, Albany, Hudson, Syracuse, Rochester, Elmira, Buffalo.
 Pennsylvania: Wilkesbarre, Scranton, Stroudsburg, Elizabeth, Amboy, Philadelphia, Pittsburg, Connellsville, Uniontown, Titusville, Erie.
 Maryland: Baltimore.
 Virginia: Richmond, Petersburg, Norfolk, Newport News, Lynchburg, Roanoke.
 West Virginia: Charleston, Wheeling.
 North Carolina: Durham, Raleigh, Goldsboro, Winston, Salem, Charlotte, Statesville.
 Georgia: Rome, Athens, Atlanta, Macon, Columbus, Albany, Savannah.
 Florida: Jacksonville, Tampa.
 Alabama: Florence, Decatur, Huntsville, Gadsden, Aniston, Birmingham, Bessemer, Demopolis.
 Selma, Montgomery, Enfield.
 Mississippi: Columbus, Meridian, Jackson, Vicksburg, Port Gibson, Natchez, Brookhaven.
 Tennessee: Knoxville, Chattanooga, Columbia, Lexington, Memphis, Clarksville.
 Kentucky: Livingston, Louisville, Paducah.
 Ohio: Cleveland, Toledo, Akron, Youngstown, Canton, Bellaire, Zanesville, Columbus, Springfield.
 Piqua, Dayton, Hamilton, Cincinnati, Portsmouth.
 Indiana: Lyonsburg, Goshen, Columbia City, Fort Wayne, Logansport, Wabash, Peru, Kokomo.
 Lafayette, Marion, Indianapolis, Terre Haute, Vincennes, Evansville, Madison, Mount Vernon.
 Michigan: Alpena, Grayling, Cadillac, Bay City, Port Huron, Detroit, Grand Rapids, Kalamazoo.
 Calumet, Hancock.
 Wisconsin: Eau Claire, Wausau, Appleton, Manitowoc, Sheboygan, Milwaukee, La Crosse.
 Illinois: Elgin, Joliet, Streator, Peoria, Champaign, Springfield, Cairo, Quincy.
 Missouri: St. Louis, Kansas City, St. Joseph.
 Arkansas: Jonesboro, Fort Smith, Little Rock, Hot Springs, Pine Bluff, Camden, Texarkana.
 Louisiana: Monroe, Shreveport, Opelousas, Flaqueminie, New Orleans, Baton Rouge.
 Iowa: Dubuque, Des Moines, Council Bluffs, Centerville, Keokuk, Davenport, Sioux City.
 Minnesota: St. Paul, Minneapolis.
 Nebraska: Lincoln, Omaha.
 Kansas: Atchison, Leavenworth.
 Texas: Gainesville, Greenville, Dallas, Tyler, Marshall, Palestine, Cleburne, Waco, Beaumont.
 Houston, Hallettsville, Victoria, San Antonio, Luling, Austin.
 Montana: Helena.
 Colorado: Denver.
 Arizona: Solomonville.
 Utah: Salt Lake City.
 Idaho: Boise City.
 California: Sacramento.

With a like thought back of it, but of wider scope than the plan just outlined, was one presented in New York City last winter to relieve the congestion of the city by the removal not simply of the industrial agent—the immigrant, but the industrial opportunity—the big or little factory that gives him employment and is an attractive force keeping him in the city.

The clothing manufacturers in especial were to be urged to remove their factories to other places, where their laborers would naturally follow them, thus drawing of greater masses of the population than the colonization schemes formerly tried were likely to do.

This plan is now being worked out by the Jewish Agricultural and Industrial Aid Society, but as yet there are few definite results to show.

It is meant to place this undertaking on a strictly business basis, by offering to manufacturers solid inducements that shall make them willing to remove. Sometime offers to manufacturers come from towns that would like to have factories established within their limits, of especially favorable terms of rental of factory buildings. Sometimes the society will give the manufacturer help in removing his plant, and in erecting buildings for employees. The inducements to workers are (1) as above mentioned, the removal of the factory which employs them; (2) cheaper house rent; (3) advances of money by the society to help them to move and to establish themselves in the new district; (4) greater possibilities of ownership of land in country districts.

It is claimed that this method of dispersion is particularly practical in that it makes use of existing opportunities. The factories the society propose to remove are already in running order; the towns to which they are to be removed are long-established communities. Settlements made under such conditions do not involve the undue expenditure of effort needed to plant new immigrants in a totally undeveloped place.

In Chicago an association called "The Jewish Agriculturists' Aid Society of America" has for some years been carrying on the work of removing poor Jews from the cities and establishing them on farms. The secretary of the association writes as follows with regard to their work:

While the activity of our society extends over a period of nearly 13 years, yet the work has been but experimental, and consequently slow of achievement. The purpose of our society is to encourage husbandry among the poor of our people, and in doing this we aim less at colonization, in the common acceptance of the term, than at having individual families take up the work of farming among those who have been at that calling for generations, no matter of what nationality or denomination they be.

During the years of our activity we have assisted and encouraged nearly 100 families to make farming their sole occupation. One-fifth of that number have been assisted within the last 6 months—since November, 1900. How many of those who have received our aid to settle as farmers have left that avocation we, of course, can not tell; we have, however reason to believe that the percentage is a very small one indeed, if any at all. Besides some of our protégés who have gone West in search of larger farms than what they worked while nearer to us, we are to-day in touch with over 50 of our farmer families who are actually engaged at husbandry and are more or less successful at it.

All of our protégés are immigrants, though some of them have been in the country for more than 20 years.

Rejecting the colonization principle, this society holds that "individualism * * * has * * * shown itself to be the proper course that must be followed in dealing with the Jewish would-be farmer. * * * The choice of locality and land is left to the prospective farmer. He is to select, purchase, or rent, as the case may be, the land he is to work, and he is to contract the price and the terms of the sale or rental."

This method "disposes of much of the overzealousness so obnoxious to the nature of the Russian Jew," and which has often caused schemes intended for his benefit to fail.

The society began its work in the fall of 1888 by assisting 4 families to purchase 80 acres of virgin prairie land in southwestern Minnesota. Since then from 2 to 10 families have been assisted to remove each year. Up to the present year (1901), 76 families have been helped. Seventy-one of these families are in the middle West, in the States of Illinois, Michigan, Iowa, Wisconsin, Minnesota, and the Dakotas. Eight are working on rented farms, 24 have filed homestead claims on Government land, 39 are located on 30 separate homesteads, aggregating 2,987 acres of land. These homesteads were bought by their owners at a cost of \$38,980, and to-day represent a value of \$63,970. Five of these homesteads are berry and fruit farms purchased for about \$100 per acre; six are cultivated farms purchased for about \$20 per acre, 19 were on virgin prairie or wood lands purchased at from \$5 to \$8 per acre. These latter have been greatly improved by their owners. Over 1,000 of the 2,140 acres comprised in them are under cultivation, and 800 are used for pasturage.

The society encourage their would-be farmers to purchase new, uncultivated soil at reasonably low prices, believing that this is the most advantageous method for them. They will, however, assist those who wish to file claims for homesteads on Government lands.

In the report of the society¹ for 1901 are well set forth some of the benefits expected to arise from life on the farm. The report says:

Farm life does not permit working at odd and irregular hours. One can not work behind the plow as he may work at the sewing machine, after the hour when the day's work ought to be done. Nor can the work on the farm be deferred for "later on." The care for the live stock on the farm demands greater punctuality than does the handling of the dead stock in the meat shop. Mealtimes and bedtime come on the farm with more forcible demands for the attention due them than they do in the city. Day and night come and rule on the farm with far more telling effect than they do in the sweat shop or in the factory. The turning of night into day—one of the great curses of the ghetto—is almost an impossibility on the farm. Surely there exists no such opportunity there for this viciousness and disorder as exists in the ghetto. All these conditions have not failed in their good effect on the mind and disposition of our farmers.

Praiseworthy as all of these efforts are, it has to be admitted that they have so far been unable fully to meet the situation. This is especially true of the agricultural work. The removal of 100 or 200 families a year has little effect upon city populations that are added to annually by from 10,000 to 40,000 persons. The assisted colonies are not growing materially. The work of establishing Jewish farmers on abandoned farms seems to have slackened up considerably. Reports of the various societies interested in agricultural removal indicate that individual Jewish farmers once established are fairly successful and remain in farming; but instance after instance of Jewish farmers giving up their farms is given from private sources.

¹ Reform Advocate, Chicago, June 8, 1901, p. 532.

² Jewish Agriculturists' Aid Society of America, report, Chicago, Ill., 1901, p. 13.

The most successful side of the work seems to be that which places Jewish immigrants in industrial pursuits outside the cities. The numbers sent out within a year by the Industrial Removal Society—the branch of the Jewish Agricultural and Industrial Aid Society already referred to as engaged in this work, are really considerable, and, as has been seen, their beneficiaries have been sent to every State in the Union.

As to the small numbers removed, however, it is claimed that while the results for the present are small, and may be for a number of years to come, yet each family established outside of the city forms a nucleus about which other families will gather. The great mass of Jewish immigrants now coming in who remain in New York City have friends there. If the friends were elsewhere they might go elsewhere.

As to the general fitness of the Jew for agriculture it can not be inferred from the history of Jewish agriculture in this country that the Jew can not succeed in farming. It is claimed that Jewish capital invested in farming is constantly increasing in proportion to the spread of industrial activity in agricultural districts.¹

In many cases Jews have given up farming, not because they were unsuccessful, but simply because they have found opportunities in other occupations that pay them much better. The American farmer is becoming more or less dissatisfied with his calling, and there is a general idea afloat that farming does not pay as well as industrial pursuits. It is not surprising, then, that the Jewish farmer shares this thought, and will seek to enter those pursuits which he thinks will offer the best chances of a livelihood.

III. IMMIGRATION AND AGRICULTURE IN THE SEPARATE STATES.

NORTH ATLANTIC STATES.

MAINE.

(See table, p. 583.)

With regard to opportunities for immigrants in Maine, the commissioner of the bureau of industrial and labor statistics of that State wrote in 1894 as follows:²

Maine, as you well know, being outside of the lines of European immigration, has but a small percentage of foreign-born population. Of the total foreign population of the State in 1890, which was 78,961, 52,076 were from Canada and Newfoundland, leaving but 26,885 as the number from all other countries. Our State is therefore quite free from the influences, good, bad, and indifferent, which come from foreign immigration, and is very well satisfied with this condition of things. In the northern part of our State, Aroostook County, which includes 6,800 square miles of our territory and possesses some of the most fertile soil in New England, is an immense field for agricultural development. A thriving colony of Swedes is established in a township called New Sweden, in the central part of Aroostook County. Commencing with 50 colonists from Sweden in 1870, this settlement now numbers, including those occupying farms in neighboring towns, some 1,500 souls. They are a happy, industrious, and prosperous community, and are universally regarded with great favor throughout the State. There is room in Aroostook County for more of this class of settlers. With some means to start with, they can easily obtain fertile lands for farms, and with the same economy and industry that characterize their countrymen already there, can become independent farmers in a few years.

A brief and comprehensive answer to your questions would be that Scandinavian immigrants to develop and improve our agricultural resources would be welcome and conducive to the good of the State, but that other classes of immigrants from Europe can not be encouraged to come to Maine.

Yours, respectfully,

S. W. MATTHEWS,

Commissioner of Bureau of Industrial and Labor Statistics.

In December, 1900, the secretary of the agricultural department of the State writes:

First. There are greater opportunities in Maine for immigrants at the present time than at any time in the past. This is particularly true in farming, lumbering, and general manufacturing occupations.

Second. Swedes, Acadian and Canadian French, and Finns have proved the most effective as farmers and farm laborers.

Third. The success of foreign farmers appears to be greater in many instances than that of the American born, owing mostly, in my judgment, to the fact that they are willing to live very much cheaper. In many instances, also, they take fuller advantage of the natural resources of the land.

Fourth. I think farmers, as a rule, would oppose the further influx of foreigners into our State.

Fifth. There are no efforts being made at the present time, either by the State, public authorities, or by private persons or corporations, so far as I know, to attract immigrants.

Sixth. About 25 years ago a settlement of Swedes was made in northern Aroostook County, under the auspices of the State. This settlement has rapidly grown until it includes several townships. These people are industrious and honest, and in every way make good citizens. I think the settlement is continually increasing in numbers. Quite a little colony of Jews has settled in one of the poorer towns in a central county of the State, and I know of one or more small colonies of Finns. As a rule these people are industrious and fairly prosperous.

Yours, very truly,

B. WALKER MCKEN.

¹ American Jewish Year Book, 1900-01, p. 72.

² Report of the Immigration Investigating Commission, Washington, 1895, p. 138.

The colony of Swedes referred to in the letter of the secretary of agriculture is the one in the town of New Sweden, mentioned by the commissioner of labor in the letter first quoted. One of the colonies of Finns is in South Thomaston, and the colony of Jews was in the town of Bowdoinham. This latter colony has, however, left the place, whether on account of nonsuccess there or for some other reason could not be learned.

The statement of the secretary of agriculture that farmers would probably oppose the further influx of foreigners into the State is, in the main, borne out by the statements of representative farmers.¹ All but one reported little or no opportunity for newly arrived immigrants who do not speak English. All thus reporting, however, represented the most densely populated counties of the State—those in the extreme southern and western portion, containing the large cities. And in several cases the statement that there was little or no chance for newly arrived immigrants was modified by some proviso, as “unless they are reliable, intelligent, and will work for less than natives,” “unless they are well recommended,” and so on. One county heard from (Somerset), much less densely populated than those reporting unfavorably upon the chances for newly arrived immigrants, would welcome them, according to the letter received from a prominent farmer addressed the e. He writes as follows:

I read the communication received from you in regard to farm laborers at several farm gatherings and it was universally believed that a number of laborers could find profitable employment in this vicinity.

If some plan could be devised by which some proper person should have authority to see that immigrants were protected in their rights, a large number of them could be employed as farm laborers, incapable, to their own advantage, that of the farmer, and the State of Maine as well.

As a matter of fact, farmers are bothered to get laborers. Americans, as a rule, do not like to work on a farm. I have thought for several years that Swedes, Danes, and other good farm laborers could be brought to Maine to good advantage. Employment could be found for men and their wives as well as for single men.

If a number of these people of one nationality or one language could come to one place, so that they could meet on Sundays and in the evening, they would be contented and happy.

It will be noticed in the tables that farm laborers in the counties heard from are a yet mainly native Americans or Canadians. There are a few Swedes noted in Kennebec County, both as farm laborers and as independent farmers, and in York County a few Irish and Germans as farmers.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

YORK COUNTY.—Good chances for renting farms; the tenant to pay half of the crop and half the growth of the stock; owner will furnish tools and stock. Farms can be purchased for about the cost of buildings and the value of the standing wood and timber.

CUMBERLAND COUNTY.—Farms are to let at all times, usually for a cash sum. Farms can be bought for less than the buildings would cost.

OXFORD COUNTY.—No opportunities for renting. As to ownership, a young man without capital should find employment on a well-managed farm, where he can “learn the trade” and earn enough to partly pay for a farm.

KENNEBEC COUNTY.—A few good chances for renting on easy terms, but not many inducements for a poor man to purchase on part payments while hiring out.

LINCOLN COUNTY.—No opportunities for tenancy or purchase on easy terms.

SOMERSET COUNTY.—Good for renting; for purchasing on easy terms, as good as any State in the Union.

NEW HAMPSHIRE.

(See table, p. 584.)

The secretary of the State board of agriculture stated to the immigration investigating commission in 1894 that “the class of immigrants most needed in New Hampshire are men for agricultural laborers and to purchase low-priced farms and women to do general housework. * * * Swedes and Germans would be the most desirable for the purpose named.”

Reference to the table for the State, giving reports from representative farmers shows that of the 7 counties heard from the 5 of greatest density of population afford little or no opportunity for newly arrived immigrants; the 2 least thickly settled would receive them. Foreign farmers are reported in 4 counties. Foreign laborers from European countries—Swedes, Poles, and Irish—are found in the 3 counties of least density of population. Where Swedes and Poles are employed they seem to be like

¹ See table for Maine.

One correspondent writes from Cheshire County: "Poles are our main reliance," and notes their thrift, and at the same time their desire to improve their condition. He says:

Poles are sharp to ask all they earn, and do not fail to raise their demands as they learn our language. * * * For years I have been a sort of banker for the Poles in this vicinity, and have been surprised at the short time in which they gather from \$600 to \$1,000.

Some opportunities for starting in independent farming are afforded by the purchase of so-called "abandoned farms." The master of the State grange, Mr. N. J. Bachelder, has stated¹ that as a result of a canvass of the State, made about 10 years ago, it was found that there were, out of 32,000 farms in the State, about 1,000 upon which were buildings suitable for occupancy but without occupants. This does not include lands which have been more completely abandoned and upon which no buildings exist. Many of this latter class are growing up to timber, and no use is made of them except for pasturage. Many of these places are unsuited for the use of agricultural machinery, the fertility of the soil is exhausted, and under present circumstances the farms are not profitable to cultivate. Careful, intensive farming, however, would restore fertility, and a growing local market, afforded by the growth of towns and cities and the increase of the summer-boarding business, would offer an inducement to engage in such farming. Farms located near cities and large villages are more productive than they ever were in the past. During the past 10 years 75 per cent of the 1,000 abandoned farms with buildings have been taken up and are now occupied. This has been done mainly by native Americans, but some foreigners have taken up land in this way. There seems to be every reason why industrious foreign farmers should find an opportunity to earn a living on such land by the careful agricultural methods with which they are familiar, in raising truck for boarding-house or summer-residence communities, or for the market in local towns and cities.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CHESHIRE COUNTY.—(1) Some opportunity for tenancy on farms and by rental. Not many farms for sale in Keene, but there are hill farms within a few miles of Keene for sale. (2) Desirable tenants are always in demand; rent payments or by shares. There are good opportunities for a poor man to establish himself in independent farming.

HILLSBORO COUNTY.—Not any chances of renting, but a man with a few hundred dollars could buy a small farm and pay for it on easy terms.

ROCKINGHAM COUNTY.—Only a few opportunities for tenant farming. No fixed terms; halves is perhaps the most usual arrangement. Some men can manage to purchase land on payments while hiring out. A Canadian Frenchman did near our village.

STRAFFORD COUNTY.—There are a few vacated farms in our locality, and they are often rented or leased to parties for small rentals to hold places together or to hold the old homestead, and also to enable owners to carry insurance. Opportunities for purchase are very slight. With wages as low as they are at present it is all a poor man can do to provide his family's everyday livelihood.

MERRIMACK COUNTY.—There are no opportunities for tenancy, and very limited opportunities for purchase on easy terms.

SULLIVAN COUNTY.—There are some places to be purchased on quite reasonable terms.

CARROLL COUNTY.—There are good opportunities to become a tenant farmer on shares, and very fair opportunities for purchase.

VERMONT.

(See table, p. 585.)

The secretary of the State board of agriculture states, with regard to immigration as related to agriculture in the State at the present time, that no efforts are being made in the State, either by public or private bodies, to attract immigrants. Efforts of this kind in the past have not been very successful, and the farmers as a class would not favor the further influx of foreigners. There are, however, opportunities for immigrants as farm laborers. Farm laborers' wages are from \$15 to \$20 per month through the year. The secretary writes, further:

Never has farm labor been so scarce since I knew anything about farm work—which has been for full 40 years—as during the season of 1900. It is a general complaint all over the State. Many hundred industrious men could find employment in every county in the State at reasonable compensation.

¹ Report of Industrial Commission, vol. x, p. 40, 1899.

Representative farmers speak of the same condition of things. One from Rutland County writes:

Am much interested in this matter and would like to hear more of it. Just at present there is a marked scarcity of farm help in this immediate vicinity. * * * I have personally been looking for help for months without success.

Another, from Caledonia County, writes:

Good farm help, both male and female, are wanted, and when found faithful and efficient practically command their own price. I call to mind now several parties who would like help, if it was to be had, both in and out of doors (male and female), at good wages and in good homes.

Testimony before the Industrial Commission¹ shows that there has been a gradual falling off in the number of persons employed on farms in the last 50 years. This is partly due to the general movement to the West and to the cities that has been taking young men from the farms, and partly to the introduction of agricultural machinery, which makes it unnecessary to employ so many men to cultivate a farm as formerly.

The condition of those still employed on farms is, however, materially better than that of the same class in former times, and the tendency to drift away from the farms is at the present time about at a standstill. Employment of labor on Vermont farms is quite constant. There is but little transient labor. Canadian French, Swedes, Norwegians, and Poles come in to do this class of work, such as haying and harvesting—the Swedes, Norwegians, and Poles in increasing proportions of late years. The Scandinavians usually come from Sweden and Norway direct, and are secured as farm laborers at the immigrant station. A farmer, or several joining together, will send to employment agencies at the immigrant station for a certain number of laborers, and these will be shipped to him. They begin at low wages, continue in service until they have commanded better wages and saved up some money, then purchase farms and settle down as permanent residents. They make good help and good citizens.

Those who come are mostly young, unmarried men, but some have families that follow later. Some Scandinavian women are coming as house help, and are well liked. When the Scandinavians settle down as farmers they do not gather in colonies, nor show any disposition to do so; nor do they seem to care to migrate farther west to Scandinavian settlements.

According to the witness giving the above information before the Industrial Commission, there seems no material reason, at least, why they should do so. He gives it as his opinion, after a trip through the West with a view to learning conditions of farming and prices of land, that there is no farm land as productive and cheap as the lands that can be bought in the East, and particularly in Vermont.

There has been a decline of a third or one-half in the prices of land in Vermont, making it, with reference to productive value, some of the cheapest land in the country. Prices range from \$5 to \$50 per acre. The \$5 farms are some distance from town and school; some are rather rough and not adapted, without further improvement, to the use of machinery; a great many are quite fertile and productive. The Scandinavian immigrants, not being so particular about social advantages as the native-born farmers, are willing to take such farms at the low price they are held at, and do well on them.

While the Scandinavians seem to be regarded as the best farm help, Poles are found quite satisfactory. These men also are brought in in considerable numbers every spring, and they, too, show no disposition to colonize or to preserve foreign customs.

The foreign farm laborers so far do not seem to have had any marked influence on agriculture in the State. The greater proportion of farm help is still native born.

The State secretary of agriculture says that of the foreigners the French, Irish, and Norwegians make the best farmers, but Americans are the most successful.

Letters received from representative farmers in six counties confirm the above statements in most points. The kind of farming reported is largely dairying, consequently a large proportion of the labor employed is needed throughout the year. (See table, p. 585.)

Some opportunity for married men as laborers is shown, and a little for women as houseworkers. The farmers are divided as to their preference of nationalities as laborers, but, as in Maine and New Hampshire, it is to be noticed that the greater welcome is given to newly arrived immigrants in the less densely populated counties.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

WINDOM COUNTY.—Few opportunities to become a tenant farmer, but farms are cheap and can be bought on easy terms.

¹ Mr. Victor J. Spear: Reports of the Industrial Commission, vol. x, pp. 402 ff.

RUTLAND COUNTY.—Quite a number of farms are let, usually on shares. There are fine opportunities in Vermont for a poor man to undertake sheep farming on cheap land, but dairy farming requires capital and all of a man's time.

WINDSOR COUNTY.—(1) Fair opportunities to become a tenant farmer on shares and opportunities for purchase on easy terms are very good. (2) There are good opportunities to become a tenant farmer on halves, or its equivalent, and good chances for purchase on easy terms.

CALEDONIA COUNTY.—There are farmers that lease farms, with stock and tools; more would do so if they could find reliable tenants. As to purchasing, the best plan is to work out a few years before buying a farm. There are farmers who act as their own foremen, who would furnish a comfortable tenement to a man who would work and board himself.

ORLEANS COUNTY.—There are limited opportunities only for tenancy, but opportunities for purchase are as good as anywhere.

FRANKLIN COUNTY.—Many farms are rented on shares. The tenant furnishes half of seed, half of repairs, etc., half of taxes, and does all the work for half the proceeds. Other farms are rented for cash rental, at from \$12.50 to \$15 per cow. There are no opportunities for a poor man to establish himself in independent farming while hiring out. Dairy farming requires close attention.

MASSACHUSETTS.

(See table, p. 586.)

The secretary of the State board of agriculture writes as follows:

This State, as is well known, is not an agricultural, but rather a manufacturing, commercial, and residential State, and we have a large population in cities and large towns. Our farming is in the line of specialties rather than general. Dairying, market gardening, and fruit growing are the principal lines, with tobacco growing in the Connecticut Valley as a prominent exception.

Replying to your questions more in detail, would say:

1. Yes, there are greater opportunities for immigrants than in past years, owing to improved business conditions. Probably the conditions in all occupations are better now than in the recent years of industrial depression.

2. In the Connecticut Valley the Poles have come in pretty fast in the past 10 years, and they now constitute a very large proportion of available farm labor. They are generally considered very satisfactory and nearly every farmer has one or more. In the market gardens around Boston many French Canadians are employed, and appear to give general satisfaction. In the southeastern or cape sections many Portuguese are abandoning fishing and going onto the farms. Of late years considerable farm help in the eastern part of the State has come from Nova Scotia and New Brunswick.

3. We have no reasons for thinking that the foreign farmers (and the proportion of these is small), are any improvement over the native.

4. Farmers favor the coming in of the better classes of foreigners, those who are likely to become useful citizens.

5. No special efforts are being made to attract immigrants. For 10 years or so this office has tried to gather and circulate information concerning available farm property. We have issued several editions of a farm catalogue, and we got many calls for them from New York and States farther south and west.

There are employment agencies in our cities, and, of course, our real estate agents are constantly on the lookout for available farm property which can be handled by them advantageously.

6. No (there are no agricultural colonies of foreigners in the State).

Yours, very respectfully,

J. W. STOCKWELL, *Secretary.*

The "abandoned farms" above referred to, as enumerated in 1890, were 1,461 in number; 772 with buildings, 689 without. The average size of such farms with buildings was 86 acres; without buildings, 87 acres. Much of the abandoned land could be bought for less than \$10 per acre. As a result of the movement to bring these abandoned farms to public notice 309 farms were sold up to September, 1900. Judging by the names a large proportion of the purchasers were of American parentage. In one instance reported the original purchaser afterwards sold the property to a Swede. From another report it appears that there are no abandoned farms in the particular town heard from (Bristol County), as the Portuguese are taking all that class of property, and a representative farmer in Hampshire County speaks of Poles settling in their own houses on old farms.

Again the connection is seen between low density of population and the call for foreign immigrants. Representative farmers from counties of population density less than 100 to the square mile agree in saying that there are good chances for immigrants in their respective neighborhoods. (See table, p. 586.) Farmers in crowded counties, of 150 to 700 to the square mile, agree in saying there are few, if any, openings for immigrants. There is general complaint of farm labor drifting to the cities. One farmer writes (from Essex County): "Most of the men who come onto our farms soon leave for positions in some of our manufactories. * * * We are not strictly a farming community, but depend mostly on the shops, where our boys drift as soon as they get out of school." Even the foreigners are more or less temporary on the farms. Another farmer writes (Worcester County): "Poles stay the longest. Swedes stay only until they can speak English." The foreigners, however, do not all or for the most part go from the farms to the factories. Many give up their

places as farm laborers to become independent farmers. A farmer in Franklin County writes that French and Irish who came in 50 or 60 years ago are now settled on their own land and among the best citizens. He considers their coming a great benefit to the community as well as to themselves. And now, he reports, the Poles also are settling in homes of their own, some on old farms and others in villages. In onion sections, another farmer writes, Poles have first hired, then bought onion farms. A correspondent from Berkshire County writes that French and Irish farmers in the county "are making very thrifty people. In fact the native farmers are running out."

There is fair encouragement for married farm laborers, and considerable work for women and children. (See table, p. 586.) The table also shows a great variety of nationalities as farmers and farm laborers. Finns are noted in one county (Barnstable) only, and Italians in one county (Plymouth) only.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

BARNSTABLE COUNTY.—There are some chances for renting farms. There is plenty of opportunity for thrifty immigrants to establish themselves in independent farming.

PLYMOUTH COUNTY.—There are no opportunities for tenancy here. There is a good chance for an active, intelligent man of good habits to get a good farm in two years. Land is very cheap here, and within 14 miles of Boston. Good land can be purchased for \$25 an acre.

BRISTOL COUNTY.—There is not much chance for renting. The opportunities for purchase on easy payments and while hiring out are fair; in some cases it is done.

MIDDLESEX COUNTY.—There is no tenant farming in this vicinity. Several farms are for sale, however. Some are paying for land while hiring out.

ESSEX COUNTY.—(1) Farms can be bought for less than the cost of buildings. (2) Few opportunities for tenant farming, and none to speak of for purchasing land while hiring out.

WORCESTER COUNTY.—(1) There is not much chance for foreigners to become tenant farmers until they learn New England ways. There are many chances for a good laborer to establish himself in independent farming while hiring out. (2) There are good chances to hire farms with or without stock and tools if the tenant is responsible. There are good opportunities for a poor man to purchase if he is industrious, frugal, and provident. (3) There are no opportunities for tenant farming. There are for purchasing farming land cheap and on easy terms of payment. (4) Very few farms are let, but farms can be bought at moderate prices 2 miles out from villages. (5) Few, if any, opportunities for renting; fairly good for purchase on easy terms.

HAMPSHIRE COUNTY.—Not many opportunities for tenant farming; for purchase on easy terms while hiring out the opportunities are good, and there is plenty of work to be had.

FRANKLIN COUNTY.—(1) Considerable land is rented to Polish families to grow onions, in this vicinity; also tobacco and other crops. As to purchasing land while hiring out, the prospect is encouraging for those whom farmers have confidence in. (2) There are some opportunities for renting farms. Purchasing land on payments, while the purchaser was earning a living by hiring out, has been done in numerous cases. In onion and tobacco sections many Poles have hired land by the acre to raise onions, or have taken fields to work on halves, the owner usually furnishing fertilizer and seed. (3) The opportunities for foreigners to become tenants are not good, as they are not accustomed to American methods. Some abandoned farms are to be purchased on easy terms.

BERKSHIRE COUNTY.—In the back towns farms are very low. Price, \$10 per acre, including buildings. These are good farms, but back from the centers. Purchaser, by making a small payment down, can take his own time.

RHODE ISLAND.

(See table, p. 588.)

In 1894 the governor of the State wrote to the Immigration Investigating Commission with regard to opportunities for immigrants, as follows:¹

I do not know of any trade, profession, or occupation at the present time in this State that is not more than supplied with all the labor needed.

Rhode Island is largely a manufacturing State, and I am informed by our commissioner of industrial statistics that scarcely two-thirds of the full force that can be engaged in the factories is now employed regularly.

Yours, very truly,

D. RUSSELL BROWN, Governor.

¹ Report Immigration Investigating Commission, Washington, 1895, p. 150.

As to present conditions, the secretary of the State board of agriculture reports that there are no greater opportunities for immigrants than in 1894, unless they go to the land. There would seem to be excellent opportunities for the purchase of farming land. Rhode Island, like other New England States, has its "abandoned farms," which the State is interested in bringing again into cultivation. It is stated in the Descriptive Catalogue of such farms, published by the State board of agriculture (p. 3), that "while Rhode Island is not distinctively an agricultural State, yet * * * a large number of inhabitants derive all support directly from the soil." * * *

"Neglected or untilled farms are found in every county of the State," * * * which "were not deserted because they were nonproductive." * * * "Most of these farms, if not every one, will yield a better living than thousands in cities are compelled to accept." There are 349 untilled farms recorded in the catalogue for this small State—251 with buildings, 98 without. The average acreage of these farms is 87, of which 34½ (average) are tillage, 4½ pasture, and 48 are wooded, and the average value is \$900 per farm.

There are opportunities not only for those who wish to become farm owners, but for farm laborers. A representative farmer writes that farm wages have increased in recent years because the factories are drawing off the farm laborers, offering them better wages, fewer hours, and more personal liberty.

Farmers would probably favor the influx of foreigners, as "they might not be able to cultivate their farms without them. The American-born farmer of this generation will not work on a farm if he can live—half live—exist—by any other occupation," the Secretary of agriculture states. But no efforts are being made by public or private bodies in the State to attract immigrants.

The secretary of agriculture says further that, of the foreigners, Swedes are most effective as farmers and farm laborers. In reply to the question whether the success of foreign farmers is as great as that of the American born, he also says: "The foreign farmer may have no more than the American farmer, but it is more to him, and makes him more contented."

Replies received from representative farmers were too few to give a general view of conditions.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

BRISTOL COUNTY.—Opportunities for renting are usually on poor and unprofitable farms only. There is about the same chance as elsewhere for a poor man to become an independent farmer while hiring out, but it requires energy and thrift.

KENT COUNTY.—Opportunities for renting are very good, either to run a farm on shares or by hiring it outright. Many farms are sold by installment payments, and many good farms are for sale very cheap.

CONNECTICUT.

(See table, p. 589.)

The secretary of the State board of agriculture writes as follows with regard to present conditions as affected by foreign immigration:

1. There has been a continuous demand at fair wages for agricultural and domestic labor, and good mechanics have been in demand. Some of the factories have been closed or running on short time. Most of the Irish of the second generation are farming for themselves or have gone into other employments, so that Italians, Swedes, and Poles are coming in to perform field labor, while for domestic service we have had to resort to colored help from Virginia and North Carolina. These as a class make good servants, but are uneasy, and spend a large share of their earnings in traveling back and forth. The Swedes and the Poles give good satisfaction, and also the better class of Italians.
2. The foreign farmers live very cheaply. The women assist in field labor. They succeed in making money.
3. There is no objection generally on the part of farmers to the incoming of foreigners of the right sort.
4. There are no efforts to secure immigrants that I know of by public authority, only the publication by the State board of agriculture of a list (descriptive) of farms for sale. These are so often called "abandoned" farms that few of the good farms in the State that are for sale are listed.
5. There are colonies of Russian Jews in Salem, New London County, and perhaps in other towns in that part of the State.

The residents in those parts give differing reports about these people.

Tabulated statistics as to the price, acreage, etc., of the so-called "abandoned farms" are not given in the report referred to. There are 165 listed.

Representative farmers in 3 counties are not enthusiastic as to opportunities for purchase (see reports following). They do not, moreover, seem to agree with the secretary of agriculture, that foreign immigrants are desired, at least those newly arrived who do not speak English. But the number of localities heard from is not sufficient to afford a satisfactory general view.

According to the representative farmers heard from the independent farmers of foreign birth are mainly Irish and Germans, with a few Poles and Swedes in the more thickly settled counties. There is a greater variety of nationalities among foreign laborers. Besides the races just mentioned as farmers, Italians are noted as farm laborers in 2 counties, negroes in 2, Danes, Swiss, and Portuguese in 1.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

MIDDLESEX COUNTY.—Not much chance here for renting farms. Most of the foreigners here are Germans. They buy their land on time and hire out most of the time; work in their own places nights and Sundays.

TOLLAND COUNTY.—There are a few opportunities to rent farms. A poor man might establish himself here as an independent farmer by economy, hard work, and time.

HARTFORD COUNTY.—(1) Practically no chances to rent farms and none to buy on easy terms, as the land is too valuable, being near cities. (2) Only a few chances for renting or for purchase on easy terms. (3) Not many chances for renting. There are opportunities for purchase while hiring out, for first-class men.

NEW YORK.

(See table, p. 590.)

Reports from representative farmers in various parts of the State show that a large proportion of the farm labor employed is kept throughout the year, and there is considerable opportunity for married laborers. The fruit industry and housework give occasion for the employment of women and children; so that an immigrant family wishing to earn a living in a New York farming neighborhood would seem to have especially good chances for doing so.¹ Nine out of the fifteen farmers reporting state definitely, indeed, that there is opportunity for foreign immigrants—those newly arrived, who do not speak English. Four say that the chances are "few," or "moderate;" only one says definitely that there are none. Foreign laborers are, as a matter of fact, reported in nearly every county heard from. Irish and Germans prevail. There are many Dutch (Hollanders) in the western part of the State. According to testimony given before the Industrial Commission,² the German and Dutch settlers have been very satisfactory, and make first-class citizens. They seem to be born agriculturists. A German or Dutch immigrant will go to some farmer, stay with him for 10 years or so, and then buy the farm, the former (native-born) owner moving into town to take things easy. This change is made possible by the fact that the natural successors of the former owner—his sons—do not care for farm work, and go off to town, leaving the father, while the foreign farm hand sticks by him.³

The Germans and Dutch are somewhat inclined to gather in little neighborhood colonies, and are more or less clannish, especially the latter.⁴ They are as a rule better and more thorough farmers than the Americans. The Dutch are especially successful in reclaiming and developing muck lands, and are raising considerable quantities of onions and celery. They are bringing as much wealth into the State as the Americans.⁵

Poles, Swedes, Russians, and Hungarians are found in some counties. In one county only (Ontario) are Italians spoken of as farm laborers, and in one county (Schuyler) as independent farmers. Italians have been employed more or less in sugar-beet culture. While the beet-sugar factory at Rome was in operation, Italians, who lived along the canal with their wives and children, were employed to thin the beets. Italians are now employed for the same work on beet farms that supply the factory at Binghamton.

The sugar-beet industry, wherever it is started, offers especially favorable opportunities for foreign farmers and laborers. There are now (according to the Twelfth Census) 3 factories in the State, with a nominal daily capacity of 1,000 tons of beets; but the success of the industry largely depends on securing farmers to raise the beets and laborers to work at their culture. A prominent beet-sugar maker in the State gives it as his opinion that Americans are not suited to this work; that the prevalence of American farmers in a neighborhood is a drawback to success in beet raising, and that the tedious hand culture required for the crop the American

¹ One fruit farmer writes: "I have a tenant house that will be vacant (such a date), and want a family with boys and girls large enough to pick berries and pare and trim apples."

² Reports, vol. x, p. 323.

³ Ibid., p. 323.

laborer will not give.¹ For instance, it has been calculated that the laborer must creep $5\frac{1}{2}$ miles to thin one acre of beets, occupying 6 days in the task;² but the Americans "do not like to get down on their knees . . . the average man wants to ride."³ So that beet-sugar makers are perforce obliged to turn to the foreign element who are accustomed to and willing to do this class of work.⁴ It will be noticed in accounts of the beet industry in the different States that in all of them foreigners are assisting in carrying on the industry, and are succeeding well.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

DUTCHESS COUNTY.—There is considerable opportunity to rent farms at from \$80 to \$250 per annum or on half shares. A good many farms are for sale at from \$2,000 to \$5,000, and good help is scarce, so that probably a purchaser would have no trouble in getting work outside.

RENSSELAER COUNTY.—Good chances for renting. The tenant furnishes all labor, half the seed and taxes for half of the product, or the landlord pays taxes, furnishes stock, horses, implements, and all but labor, the tenant receiving one-third of the product. There are good chances for a man to purchase while hiring out.

ALBANY COUNTY.—Good opportunities for renting for 50 per cent of the net returns. There are good chances for purchase while hiring out, but it all depends on the man.

LEWIS COUNTY.—Many farms are rented, the tenant getting one-half the net proceeds. There are several instances in this locality of purchasing farms while the purchaser was hiring out.

JEFFERSON COUNTY.—Only a few farms are rented. Some farmers furnish everything but the work team and give one-third; others furnish half and give half, except the dairy, which is owned by the landlord. There are no opportunities for purchase on easy terms. The best farms are held at about \$50 an acre, and nearly all are unencumbered, and therefore are not for sale.

ONONDAGA COUNTY.—Good men are always in demand to handle farms on shares. Purchasing land while hiring out is not a plan to be encouraged to any great extent, as very few men can divide their attention sufficiently to make this plan a success.

SCHUYLER COUNTY.—Good tenant farmers furnish team and tools and half the live stock and half the seed grain. They receive half of all the crops raised; also live stock. A man with a small capital can find plenty of farms for sale which can easily be paid for by industry, good management, and economy.

WAYNE COUNTY.—(1) Good opportunities for tenant farmers. Many of them already have farms of their own. They can purchase while hiring out, if good managers and economical. (2) There are many farms in the vicinity worked by tenants. There are opportunities for purchase on easy terms, but land values are increasing. (3) There is plenty of opportunity for renting. Many farmers could not get tenants this spring. The usual terms are for the tenant to furnish half the seed, all the tools and the labor, and to receive half the product. The opportunities for purchase while hiring out are good if the party is frugal and reliable. Several in the neighborhood have purchased in this way.

GENESEE COUNTY.—The opportunities for renting are only fair. The land is all occupied and in good demand, either on shares or for a cash rent. The chances for purchase while hiring out are not good. The better plan is to put earnings in savings bank and go where land is cheaper.

NIAGARA COUNTY.—(1) A good many farms are rented and good tenants are in demand. Terms, sometimes money rent, but oftener a share of the products. Farm lands are cheaper here in northwestern New York than in any other part of the United States, considering the advantages. Good farms can be bought for less than cost of buildings. (2) Good opportunities for renting on half shares and good opportunities for purchase on easy terms. Land is worth from \$35 to \$80 per acre.

NEW JERSEY.

(See table, p. 592.)

*With regard to opportunities for immigrants, the State secretary of agriculture writes:

(1) There are opportunities in our State for good immigrants now, particularly such as are able to purchase our farms, which, in many cases, are owned by the old people, the young men having gone into business in the cities. Many of these farms can be bought for the cost of the improvements. If you speak of immigrants as workmen or laborers, if they understand farm work, there is plenty of room for them in our State at better wages than have been paid in previous years.

¹ Reports of Industrial Commission, vol. x, p. 555.

² Ibid., p. 574.

³ Ibid., p. 556.

(2) The Germans and Danes are the best farm laborers, although many Hungarians are employed at such laborers and some Italians among fruit growers and truck farmers.

(3) I do not know of any instances, circumstances being equal, where the foreign farmers are more successful than the American farmers. Success depends in this, as in other work, upon love for the business and understanding of its requirements.

(4) I do not think the farmers trouble themselves much about the further influx of foreigners, except that they desire such a class of immigrants as will make good American citizens. They are opposed to making this country a dumping ground for the ignorant, turbulent element from foreign countries.

(5) No efforts are made by public authorities or private persons, so far as I know, to attract immigrants: possibly corporations may do so to some extent, as Italians and some of that class work well in gangs in railroad construction and repairs, sewerage of cities, and the like.

(6) There are colonies of Russian Jews in this State, particularly in the southern portion; notably that at Woodbine, founded and sustained largely by the Baron de Hirsch funds appropriated for that purpose. There is another not far from Vineland called Alliance, and still others of smaller numbers.

According to the State secretary of agriculture,¹ foreign immigration to the farms in New Jersey is confined mostly to Hungarians, Swedes, and Germans. Swedes and Germans have had rather more experience in agriculture in the countries they came from than the Hungarians. Foreign laborers are settling and becoming proprietors, in especial, near the large cities, and are going into market gardening on a small scale.²

There is apparently no tendency to colonize shown on the part of the foreigners coming into the State, outside of the Jewish settlements, which were started strictly as colonies.

Italian laborers brought in to pick fruit have begun to get hold of the land, for fruit-raising on their own account, and have brought to productivity lands that a few years ago were considered barren and worthless. In the secretary's opinion, when the attempt has been made to form colonies of foreigners with outside aid, the progress has been much less rapid than when they have made a start by their own initiative.

Circumstances are particularly favorable in New Jersey for an immigrant who has some knowledge of agriculture and some means to establish a home there, because lands have so far decreased from former valuations that in many cases the properties can be bought for the value of the improvements on them.

The productive capacity of lands in New Jersey has been increasing steadily of late years until now the State produces more wheat to the acre than any Western State.³

A representative farmer⁴ says that a great many farms in the State are now occupied by the native born of foreign parentage and that they make very good farmers. The foreign element in his neighborhood are mainly Germans and Irish. Some of the German women work on the farms; a few of the Irish, but not many.

A representative farmer from Mercer County reports that some Italians are employed as laborers in his neighborhood, but the greater part are negroes from southwestern Virginia.⁵ They are employed because of the lack of good white help, and are preferred to foreigners because they understand the language and ways of the country.

Reference to the table of returns from representative farmers indicate that there is opportunity for immigrants, even for those who can not speak English, in all the counties heard from. Truck, dairy, and fruit farming, being extensively followed in the State, give a high proportion of employment to farm laborers the year around. Nearly all of the farmers report good opportunities for married laborers and work for women and children.

The foreign farmers reported are mainly Irish and German. In one county Dutch are mentioned. In another, Italian farmers are spoken of. These are undoubtedly connected with the agricultural colony founded by Signor Secchi de Casale in 1878 at Vineland, described in preceding pages.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CAPE MAY COUNTY.—Opportunities for renting are scarce. Truck farmers own small farms which they cultivate themselves with what help they can hire. A poor man, if enterprising, might purchase while hiring out.

CUMBERLAND COUNTY.—Farms are often rented for a cash rental. There are opportunities for purchasing a farm while the purchaser works on another, as farms are small and not very expensive.

GLOUCESTER COUNTY.—(1) There are many Germans in the neighborhood who are tenant farmers, mostly on shares. (2) The chances for purchase of a farm where the purchaser hires out are not very promising.

¹ Reports of Industrial Commission, vol. x, pp. 85, 86.
² Ibid.

³ Ibid., p. 93.
⁴ Ibid., p. 124.

⁵ Ibid., p. 132.

MONMOUTH COUNTY.—Farms are rented on shares. If the tenant furnishes implements and one-half of the stock he receives one-half the product; if the owner furnishes implements and stock, the tenant receives one-third of the product. There are no instances in this neighborhood where men have purchased land while hiring out.

MIDDLESSEX COUNTY.—There are many chances to rent farms. If the landlord furnishes everything, the tenant receives one-third of the produce. If the tenant furnishes crop and implements, he receives one-half of the produce. Chances for purchase of land were never better than at present, on account of the low price, but not by hiring out.

MERCER COUNTY.—Opportunities for renting are fair, but it would be difficult for a poor man to establish himself as a tenant farmer unless he could begin by making a payment of perhaps one-fifth of the price.

PENNSYLVANIA.

(See table, p. 593.)

With regard to immigration in relation to agriculture, the secretary of agriculture for Pennsylvania writes as follows:

The increased demand for manufactured articles and the products of our mines has made a demand for labor. The impetus given business in our towns and cities has also drawn away from the country a considerable portion of those who could have been depended upon for day's work in former years. Most of the immigrants in this State go to the mines and mills, and the demand there has been unusual during the last two years. I am not sufficiently familiar with the exact condition of these industries to be able to definitely answer your question as to the exact state of the demand at this time.

With regard to the second question, very few immigrants have come into Pennsylvania to take up land for agricultural purposes. The most of them pass through to the cheap lands of the West.

Third. The fact that very few immigrants purchase farms in this State makes it impossible for me to state as to their success as compared with our American-born agriculturists.

Fourth. Our farmers do not oppose the incoming of any person who desires to become a citizen and take up residence in the farming districts of the State. Very few, as I have stated, take advantage of our opportunities for locating amongst us.

Fifth. There have been no special efforts made to attract immigrants into this State.

Sixth. We have no agricultural "colonies" or "settlements" of foreigners in our State.

Very respectfully,

JOHN HAMILTON,
Secretary of Agriculture.

Of fifteen representative farmers heard from (see table, p. 593), seven are in counties in the eastern part of the State, four are from the centre, and four from the west. Five of the seven eastern farmers say that there are opportunities in their neighborhoods for foreign immigrants who do not speak English. Farmers from the center of the State are not so encouraging. In the western counties, again, there are more openings. The extent to which immigrants would be taken apparently has nothing to do with density of population.

Among farm laborers are many Germans, some Irish and Swedes. Welsh are found in one county (Montgomery) in a region originally settled by people of their nationality. A few Poles are noted. Little preference as to the nationality of farm laborers is expressed; such as there is, is for German and Swedes.

One farmer writes:

There are about 1,800 farms in this county (Monroe), and I think there are about 10 per cent of the owners that hire help. Nearly all of the farm work is done by the farmer and his family. There is a surplus of young men every spring that seek and secure employment in other counties. The rural population has not increased in 30 years.

Yet, notwithstanding these conditions, there would be an opportunity in almost every community for a sober, industrious German to secure a piece of land for a home and secure work among the farmers by the day at 75 cents and board.

Foreign farmers are found in all counties heard from but three (Luzerne, Center, and Westmoreland), where there were said to be none. Many are Irish and Germans. French are found in Pike and Butler counties, Belgians in Butler County, and a few Poles in Berks.

Not strictly "foreign farmers," but in some ways still representative of the foreign element in agriculture, are the so-called "Pennsylvania Dutch" in Berks, Lebanon, Lancaster, and neighboring counties. The Pennsylvania Dutch are said to be "undoubtedly the finest farmers in the United States to-day," and to have "maintained their industrial enterprises amidst all changes of prices, rates of interest, and so on, so as to increase their wealth, maintain their standard of agriculture, and keep up the standard of living, while other sections of the country have deteriorated and lost ground."¹ Land values in this section are very high—as high as \$200 an acre, but the Pennsylvania Dutch have managed to make profit even at this high capitalization. This is because they are frugal, careful of their property, and highly industrious.

¹ Testimony of John Franklin Crowell, Reports of Ind. Com., vol. 1, p. 333.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CHESTER COUNTY.—Farms may be rented on thirds and sometimes on halves. Land remote from the railroad may be bought for from \$40 to \$50 an acre.

BERKS COUNTY.—There are some farms to rent, either for a money rent or a share of the product. There are fair chances for purchase on easy terms.

MONTGOMERY COUNTY.—There are many tenant farmers in this locality. Most of them pay a cash rent; that depends upon the size and condition of the farm. Land is too valuable in this locality for a poor man to attempt to pay for a farm while hiring out.

LEHIGH COUNTY.—Tenant farmers are scarce. Good tenants can rent all the farms they want, usually on shares. There are good opportunities for purchase for the right man.

MONROE COUNTY.—There are good opportunities for renting. The tenant furnishes stock and tools and one-half of the seed, taking one-half of the crop on good farms. On poor farms tenants furnish everything and take two-thirds of the crop. There are good opportunities for purchase for a hard-working and saving man.

PIKE COUNTY.—There are good opportunities for renting, either for money rent or on shares. There are farms here that are now idle for want of good tenants. Our young men seek employment with the railroad, telegraph, and telephone companies, and farm help is scarce. Opportunities for purchasing land while hiring out are good. There are a number of Germans here who have been successful in just that way.

LUZERNE COUNTY.—There are no openings for immigrants to rent farms, and the opportunities for purchase are not good.

CUMBERLAND COUNTY.—Very limited opportunities for renting and for purchase.

BEDFORD COUNTY.—The farms here are all occupied. This would not be a good locality for renting or for purchase.

CENTER COUNTY.—Good, reliable tenant farmers are in demand. Terms are one-third of the product.

CAMERON COUNTY.—Tenant farming does not pay. There is considerable wild mountain land which could be made productive under good management, but not level land.

WESTMORELAND COUNTY.—For good farmers there is plenty of opportunity to rent farms for half of the crops or money rent. There are plenty of opportunities for purchase of land while the purchaser hires out, but only 1 succeeds to 90 who fail.

WASHINGTON COUNTY.—There are very few openings for renting farms.

BUTLER COUNTY.—Opportunities for renting and for purchase on easy terms are not good.

WARREN COUNTY.—Several farms in this section are rented annually. Farms are usually let for a cash rental which is not very high. Land is not bought in this section while the purchaser is hiring out. It is doubtful if this could be done.

NORTH CENTRAL STATES.

OHIO.

(See table, p. 595.)

The State secretary of agriculture writes that there is a greater demand for help on the farm than in former years, that Germans are usually most effective as farmers and farm laborers, that their success as farmers is perhaps greater than that of native farmers, owing rather to greater industry and frugality than to more intensive cultivation, and that farmers, as a class, would probably favor further immigration, but no organized efforts are being made by public or private authorities to encourage it.

Reports from representative farmers (see table, p. 595) indicate that there is a call for immigrants, especially for Germans. The foreign element is not found in the southern part of the State, and in that section there is no call, or very little, for immigrants. In the central and northern counties, however, are many German farmers and farm laborers, and in these counties further additions of foreigners are desired. The correspondent from Henry County writes: "One-quarter of the well-to-do farmers of Henry County came from Germany here with nothing but willing hands. Perseverance and industry was their capital. Still they come, and still we welcome them." Another, from Logan County, writes: "Would be glad to have 50 good German families with growing children, if honest and industrious, come at once to our county."

The German families coming to some of these places are well educated, sometimes better than their American neighbors.¹ Both Germans and French show some tendency to colonize, and in some places insist upon having German and French taught in the district schools. But most of them are growing out of that idea, preferring that their children shall be educated in English.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

ROSS COUNTY.—A great deal of land is let on the tenant system. Tenant finding everything gets one-half the crop; with tools and team furnished, one-third. Opportunities for a poor man to purchase are not very good. Land is high and can not be bought in small plats.

DARKE COUNTY.—Farms rent on shares; one-half is given, and farms are in demand. Purchasers of farms pay a fair amount of cash down.

CHAMPAIGN COUNTY.—Men save their wages, get teams, then rent land for half the crop, or they take the farmers' teams and work the land for a third. Many make enough in this way to buy farms of their own. As to opportunities for a poor man to become an independent farmer, land is from \$50 to \$100 an acre, "and no one saves much money here. Young farm laborers generally have horses and buggies, dress well, and have a good time. They do not try to save much in the old-fashioned way."

LOGAN COUNTY.—Fair chances for tenancy if tenant is able to equip farm. Better, if able to equip with machines and half the stock. Tenant laborers mostly desired with families. Good chances for purchase.

AUGLAIZE COUNTY.—There are more tenant farmers than places. But little land is for sale and that high.

MARION COUNTY.—Good chances for tenancy. Tenant gets one-third of crop if teams and implements are furnished; one-half if he furnishes these himself. Many have purchased land by saving earnings until able to make a payment.

HANCOCK COUNTY.—Good chances for tenancy. Grain or cash rent. Good chances for purchase by right kind of man.

LACKING COUNTY.—When owner of farm furnishes everything, tenant gets one-third. When tenant has team and tools, he gets one-half. Good chances for purchase.

NOBLE COUNTY.—Many farmers wish tenants. Many farmers have moved to town and have tenants on their farms. Tenant owns half of the stock, pays half of the taxes, and does all the work and a certain amount of repairing. There are some opportunities for a man to secure land and pay for it in small payments; but lands are increasing in demand and prices. Have been very low. Depreciated nearly one-half during panic a few years ago.

TUSCARAWAS COUNTY.—Good opportunities for tenancy on half-crop system. Not much opportunity for a poor man to purchase unless he can pay one-third cash and work in coal mines to pay balance. Land is high.

HENRY COUNTY.—Terms of tenancy: Tenant, three-fifths; landlord, two-fifths of general products and half of hay. Other farms, tenant furnishes one-half teams, tools, seed, and stock (to be fed from farm crops), and receives one-half the crop. As to purchase while hiring out, correspondent says: "That is the way I got my farm. Industrious men are doing the same every year; but they can't do it by patronizing all the saloons and whittling pine sticks."

INDIANA.

(See table, p. 597.)

There are many foreign farm laborers in the State, mostly Swedes and Germans. They have a tendency to colonize, and wherever a German or Swedish settlement has been made, the price of land advances.² They make desirable citizens, and most of them are as well educated as the same number of Americans.

The representative farmers heard from do not mention Swedish farmers or laborers. (See table, p. 597.) German farmers are noted in the southern counties. In the same counties the bulk of the farm labor is said to be native white, and there is little call for immigrants. One farmer writes, however: "Send some men here if you can; they can get employment." In the northern counties are apparently fewer German farmers, and in those counties there is little call for immigrants.

¹ Testimony of Hon. Joseph H. Brigham, Asst. Sec. U. S. Dept. Agriculture. Reports of Ind. Com., Vol. X, p. 10.

² Testimony of Mr. Aaron Jones, master National Grange. Reports of Ind. Com., Vol. X, p. 34.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmer)

WARRICK COUNTY.—There are some opportunities for renting, but as a rule general farming is not profitable here. As to purchasing land on payments while hiring out here, this could be done. A good man could get more work than he can do.

GIBSON COUNTY.—Good opportunities for renting. There might be a chance for purchase on payments while the purchaser hired out.

PIKE COUNTY.—There is always room for a few tenant farmers at a rent of from one-third to two-fifths of the produce.

SCOTT COUNTY.—More tenant farmers are not desired. The land rents for one-half the produce in the field. As to purchase of land while the purchaser earned a living by hiring out, there would be little chance of doing so, although land is cheap. It runs from \$12 to \$25 an acre for upland.

SWITZERLAND COUNTY.—Opportunities for renting are poor, but for purchase are fairly good.

MONROE COUNTY.—Opportunities for renting are very poor. Our county is farmed mostly by the owners themselves, most of whom are small farmers. There might be a few good opportunities for purchase. Land some 5 or 6 miles from Bloomington is not very high, and can be bought on reasonable terms. As to purchase while hiring out, there is still a place for the man who is energetic and honest.

FRANKLIN COUNTY.—As to purchasing land on payments while hiring out, that all depends on the man. The opportunities are all right. The writer began in that way, and to-day is worth \$6,000 or \$7,000, and is a young man yet.

HENDRICKS COUNTY.—There are very good chances for reliable, competent men to rent farms. Terms vary from one-third to one-half of the whole crop. As to purchase, the opportunities are not very good. Land is too expensive and taxes too heavy.

HENRY COUNTY.—Terms of rental are one-half of product. Opportunities for purchase are not good.

JAY COUNTY.—In renting, landlord receives about one-half, delivered in the bushel. Some farms are for rent, but the farms are mostly occupied by the owners themselves. Land can only be bought by paying seller sufficient to secure against loss in case of foreclosure.

HUNTINGTON COUNTY.—As to tenancy, if a man can get a start, and proves himself to be a good tenant, he has no further trouble, but the supply of poor tenants is in excess of the demand. Usually tenant and landlord each furnish half and receive half, or the tenant furnishes everything and gives the landlord two-fifths. Sometimes the landlord furnishes everything and the tenant gets one-half for doing the work. Sometimes tenants furnish everything and give the landlord one-half, delivered in town, if the land is good. Opportunities for purchase are not very good unless the man has good health and is a good manager. Land is from \$30 to \$100 an acre; some of it quite poor.

DEKALB COUNTY.—There are plenty of opportunities to rent. Landlord furnishes everything and receives two-thirds of the crop. There is plenty of opportunity to purchase on easy terms if the man is energetic and enterprising.

ILLINOIS.

(See table, p. 539.)

Foreign farm laborers through central Illinois are usually Germans, Danes, and Swedes, and are an intelligent class of people. When they acquire farms of their own, they show a tendency to colonize. It is said that immigration has, in the main, improved the condition of agriculture and has not afforded more labor than there was a demand for, but that it has probably been one cause of the native-born leaving the farms. The manner of farming of German farmers does not appear to depress the price of agricultural products, as they farm like the American farmer, except that they do not perhaps lay out quite so much money for labor, getting more help from wives and children. Their manner of living may, however, depress local markets somewhat. The Germans in Illinois are good farmers, it is said, coming here with a high idea of the necessity of keeping up the fertility of the soil.¹

The table of reports from representative farmers shows Germans, French, Danes, Swedes, Scotch, and Irish as farmers in the southwestern and central counties of the state, and the same nationalities, with the exception of the French, as farm laborers. The Germans and Swedes appear to be liked as farm laborers, and the call for immigrants is general. From only one county is it reported that there are no openings for them. The large proportion of laborers employed through the year in all the counties heard from is noticeable.

¹ Testimony of Mr. Oliver Wilson: Reports of Ind. Com., vol. x, pp. 243, 246, 263.

At Streator, in this State, is a colony of Slovaks. These are not largely employed in agriculture, but some account of them may be of interest here. A leader among them writes about them as follows:

There are about 800 or 900 families of Slovaks here (in and near Streator). Most of the men are working in the coal mines, a few of them in the glass, brick, and tile factories. But very few of them do not own their own homes. In other ways they are doing fairly well. In the town of Kangley, 5 miles from Streator, are about 100 families of Slovaks, and about the same number are at Harwat. Most of these also own their homes. They also work in the coal mines.

South, southwest, and southeast, from 30 to 60 miles, there are Slovaks working in coal mines, but I do not know how they are doing. At LaSalle, 30 miles west, are a few Slovaks, and at Spring Valley and Ladd, 40 to 45 miles away, are some, but I do not know how they are doing.

In and around Streator are only 3 families or so engaged in farming, but about 20 to 25 families have left here for Minnesota within the past 10 years to go into farming. These are doing very well. Some of them are worth about \$10,000. Around Streator land is very high, running up to \$120 an acre. In the near future about 10 families are expecting to go out West looking for land.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

UNION COUNTY.—Terms for renting are for landlord to furnish teams, tools, and feed for teams, also one-half of the necessary packages for shipping, and to receive one-half of the vegetables or small fruit raised. Opportunities for a poor man to purchase land are not good unless he can pay something down or is able to cultivate the land himself. He can not hire out and pay for a farm.

ST. CLAIR COUNTY.—There are good opportunities to rent, either on shares or for money rent. The rent is generally one-third of the crop. There are no opportunities for a poor man to purchase, as land is too high.

CLINTON COUNTY.—The chances to become tenant farmers are not very good, since there are plenty of tenants equipped to take all the farms to rent. A limited number of men might find opportunities to purchase farms while hiring out.

MENARD COUNTY.—Terms of renting are mostly grain rent, tenant giving one-half of the corn and two-fifths of the small grain. Lands are worth from \$25 to \$125 an acre. Chances are much against the man who buys on time.

FULTON COUNTY.—Opportunities are good for renting on a cash rent of from \$3 to \$5 an acre or on equal shares of the product. Opportunities for a poor man to purchase land are decidedly poor, as land is held at from \$80 to \$100.

KNOX COUNTY.—(1) After men have saved enough money to buy the necessary horses and implements the opportunity to rent is good. Lands are usually \$5 to \$6 an acre or half the crop in crib or barn. There are no opportunities whatever for a poor man to purchase. Land is too high in this vicinity, ranging from \$100 an acre up. (2) There are good chances for renting farms; terms, a cash rent, usually \$5 an acre.

MCLEAN COUNTY.—Renters here pay from three-fifths to one-half grain rent or \$5 to \$5.50 per acre for farm land and \$4 for meadow and grass land. There is not much opportunity for a poor man to purchase land here, as it is usually worth \$100 an acre.

MICHIGAN.

(See table, p. 600.)

The secretary of state writes, with regard to foreign immigrants and industrial conditions in the State at the present time, as follows:

First. We believe that the opportunities for immigrants were never better than at the present time. Never before has there been such a demand for laborers as we have now. Many farmers have found it difficult to gather their crops on account of the scarcity of labor. This is due to the revival of business along all lines. We have several new industries which have created a demand for laborers, as, for instance, the sugar-beet industry, the Saginaw coal mines, and the manufacture of Portland cement.

There are also splendid opportunities for men to engage in farming of all kinds in northern Michigan. The large fruit crop in western Michigan also gave labor to a great many persons during the summer and fall.

Second. As farmers any wide-awake person can succeed, although some people are better suited for certain lines. In the sugar-beet fields, for weeding, hoeing, etc., the Germans, Poles, and Russians seem to be the most effective. This will also apply to miners as well, and perhaps to the small settlers who go out to reclaim and build up farms. In the higher grades of farming, such as dairying, fruit growing, or where stock of the various kinds is kept, it needs someone who has had experience in order to succeed. We have many Germans, Scotch, Hollanders, etc., here who are very proficient along their lines and are succeeding nicely.

Third. We find many farmers who succeed are Americans, and vice versa. If the foreign farmers succeed where our people do not, it is because of their thrifty, economical habits. They have great energy and are satisfied to begin at the bottom and grow up, while the Yankee is not built just that way always. We have intensive farmers of all nationalities.

Fourth. Farmers are all glad to see people come here who are willing to work and thus contribute to the upbuilding of the State. We need thousands of families, and those coming can easily get a home for themselves and also be a benefit to those who are here now.

Fifth. Nothing is done by the State to get immigrants. This ought to be done, by all means. Some of the railroads have been engaged in this work and have done much along that line.

There are many colonies of foreigners in the State. Worthy of especial notice is the colony of Hollanders in Ottawa and Allegan counties, on Lake Michigan, near Benton Harbor. They now number about 40,000.

The original colonists came over with the Rev. Mr. Van Raalte from Holland in 1847. They came first in large numbers in 1872, but the great influx was in 1880 and 1881. They engaged in agriculture, especially for the factories which put up pickles, canned goods, green corn, tomatoes, and for beet-sugar factories, and in the growing of peaches and fruit. After acquiring a competence they retired from farming, and the village of Holland is made up of retired Dutch farmers. They have their own college—Hope College. The women and children work in the fields the same as the men. They employ only Dutch laborers and very few are coming at the present time from the old country. They are at first slow and do not take up with American ways, but having once become aroused they do the very best work, especially in the farmers' institutes. An off-shoot from this colony is located in Chippewa County, at Rudyard, in the northern peninsula. This was started by advertising at Holland, Mich., and the first Hollander located at Rudyard in February, 1900. Others followed, and they have kept coming until there are now about 5,000 of them in the neighborhood. The Reformed Church has approved the movement, and is aiding the colonists to start a strong church movement there. There is a plan to start an academy there, which would tend to increase the attendance at Hope College, in Holland, Mich. Another colony is located in Sherman township, in Newaygo County. This is not an off-shoot from the Holland colony.

At Rudyard, Finns, Danes, and Norwegians are also located. The account given by a citizen of Rudyard of how the Finns were established there is typical of the way in which such colonies are often started. He writes:

Some 5 years ago I employed some Finlanders as farm laborers at Rudyard. After working for a time some of them took contracts for land for a home. Through their influence others have come from other parts of Michigan and a few from Finland. New immigrants are still coming. There are now about 150 Finlanders there, and they report that we may expect a good number more this spring. This will no doubt become a large settlement.

The writer speaks highly of their character as colonists. He says:

They [the Finns] are very economical and industrious and are successful farmers. They cultivate all of the crops of the country—wheat, oats, barley, rye, pease, timothy, clover, etc., also sell milk to the cheese factory. We do not hesitate to start a Finlander on a new piece of land with or without a cash payment. They improve it quickly and are among the most prompt in payment. They all buy land.

The same correspondent says he:

Can speak as well of the Danes and Norwegians, though our people of these races have not made so much effort to get their friends to join them. The Norwegian families are from other parts of Michigan. The Danes started in this way: a Danish woman married an American living near Rudyard, and induced some of her relatives to come from Denmark. A few more have followed them.

Germans are scattered over the State in somewhat smaller groups than those mentioned especially at Mount Clemens, north of Detroit and southeast of Saginaw, toward Bay City. At Frankenmuth one-third of the citizens are Germans. These Germans have succeeded well in growing sugar beets, while Americans in the State do not take to this kind of farming. American capital, however, puts in the sugar factories. Not many Germans are now coming.

There are many French Canadians in the State, especially in Menominee and Delta counties in the northern peninsula, and in the northern part of the southern peninsula. They came in originally as lumbermen. When the lumber has been cleared off the land has been practically given to them through purchase of tax titles. They live very poorly, as the soil is not advantageous. They are not clannish, as are the Germans and Hollanders, mainly because the distances compel them to mingle with Americans. In Menominee and Delta counties the French Canadians predominate, so that it may be said that this is one great French settlement. They, however, are more eager to send their children to school than is the case in the southern peninsula, where they are scattered. They do not take hold of institute or educational work in agriculture, and do not learn English, but the children are learning English. They continue to come in large numbers from Canada. Menominee and Escanaba high schools are among the best in the State and are supported by French Canadians. The country schools are also good. The parents are grossly ignorant. They get good wages at lumbering in winter and on their own farms in summer.

A prominent resident of Menominee County writes as follows about the growth of the French Canadian colony in his neighborhood:

This section of the northern peninsula of Michigan, Menominee County, was opened up to settlement by the building of the Chicago and Northwestern Railway about 1873-74. About 1876 the timber lands came into market, and I think that nearly 75 per cent of the first settlers were Canadians (French). Their first occupation was cutting and marketing the timber, but in most cases they started in to develop farms, we being among the number in our immediate locality. We find that few remain at this time of the original settlers; the majority of the Canadians get out soon after the timber is off their farms, and either take up new land near by or move further into the woods. There are, however, a few very notable exceptions. We have in our immediate vicinity about a

dozen of them who have developed farms that would do credit to an older country. They in all cases came without money, and now own houses ranging from \$2,000 to \$10,000. We would say possibly 10 per cent have held their farms and own them. The children of these families are usually settling on farms in the same neighborhood.

Very few new families are coming in. The past season three thrifty families came here from Canada and bought farms. The children of the families that follow up the timber, we find, are inclined pretty much the same way.

These families are being replaced largely by Swedes and Norwegians, who, as a rule, we find more thrifty and better farmers.

A correspondent from Delta County writes as follows about the French Canadians in that neighborhood:

The French came to this peninsula with the early settlers and have become a part of the population everywhere, being pretty well mixed in with the rest. In the very small settlements, places which have sprung up in consequence of lumbering operations, there is a percentage of about 75, perhaps more. The percentage of French in this city is about 30.

The farmers among them have bought their land, paying for it as they are able, but not usually making purchases outright. Farming is so limited in this vicinity that few of the younger generation have followed their parents in it. More will do so in the future as the industry is developed. In the city few French are merchants. Many are saloon keepers. There are many clerks among the younger French in all lines of business.

Educationally the French are average pupils. Some are very bright and few are very poor. They will not average quite as well as the children of native parentage. They have their own Catholic schools in many places. The railroad interests of the city take some into that calling.

Another correspondent from Delta County writes:

The first French-Canadian family came to this place from Negaunee, Mich., about 30 years ago. Since that time they have been coming here almost every year up to the present time. Their first occupation was logging and getting out hemlock bark, ties, posts, etc., also wood for charcoal.

Farming is the principal occupation now, except in winter, when most of the young men seek employment with different lumber concerns in this vicinity.

Fully three-fourths of them are engaged in farming and almost all own their own farms. In regard to social improvement, I should say that there has been a change for the better with a few families, but not to any great extent. Having taught school here for a number of years, I can say that the general tendency of most of the French-Canadian parents is to send the children for only a limited period to school, therefore you rarely see one who ever has gone beyond the 8th grade. They hardly ever send them to high school or any college or academy.

The children of these people are not inclined to look for any betterment in their condition, and for the most part follow in the steps of the parents. I am sorry to say that old and young like liquor too well and take things pretty easy. You can judge for yourself when I tell you that there are 8 saloons in this little "neck of the woods," supported mostly by French Canadians and their children.

What is said above about education as a part of the life of these people is confirmed by a correspondent from Menominee, who gives the following general account of the French Canadians in his neighborhood:

In the city of Menominee there is a settlement of French Canadians of about 2,500 in number. They largely live in one portion of the city which is known as "Frenchtown." So far as their life is concerned it is not essentially different from that of an average citizen. This is a lumbering center, and the occupation of the men is almost entirely that of some part of the lumbering industry. There is not a person in their community of personal influence outside of the priest.

These people are almost entirely Catholics, having a large and prosperous church, and well-organized parochial school. The children are keen and bright, but do not remain in school much after the age of 15. Very few of them have a special desire to secure an education. In this respect they fall below the other nationalities here. The boys mainly are engaged in the special work for which this city is famous.

These people are not specially thrifty; they seem to spend their money in dress and in their own special social life.

The sugar-beet industry, now carried on so extensively in Michigan, gives an opportunity for foreign laborers. One factory requires 5,000 acres of beets, and as it takes 1 person a week to thin an acre of beets, 5,000 weeks' work are required in June, and as much in September and October to harvest the beets. It is very difficult to get the labor needed. This is partly due to the fact that this factory was located in a district already given up to peach growing, which requires much labor at the same time that the beet crop requires it. Russian Jews and other foreigners are brought over from Chicago during the two busy seasons.

In the southern tier of counties many farmers have retired and have rented their farms largely to foreigners, themselves locating in villages and cities. Land there is worth from \$50 to \$60 per acre. This is about the price asked for sugar-beet land.

The fact that these farmers no longer cultivate their own farms is considered a serious obstacle in the way of progressive agriculture. This can hardly be due to the fact that the ex-farmers are Americans and the farmers who replace them are foreigners, since the latter have so abundantly shown their skill at and success in farming. It is probably due rather to the system itself, tenant farming, by whom ever carried on, being generally considered less good for the land than direct cultivation by the owner.

Prof. Clinton D. Smith, director of the State agricultural experiment station, says, however, that the owners are less inclined than they would be otherwise to arrange with tenants for raising crops that will improve the land on the ground that "the men on their farms are too ignorant to experiment on any change in methods."

Representative farmers in different parts of the State (see table, p. —) almost unanimously say that there are opportunities in the State for immigrants who do not speak English. Many German farmers are spoken of. In Kent and Charlevoix counties Dutch farmers and farm laborers are mentioned; in Mecosta and Iosco counties mention is made of Swedes and Poles. Two of the farmers express a preference for Germans as farm laborers and 1 for Swedes. On the whole, the opportunities for foreign immigrants in this State seem to be excellent.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

WAYNE COUNTY.—Farms are rented on shares or at about \$3 per acre cash. Opportunities for a poor man to establish himself in tenant farming are poor.

JACKSON COUNTY.—Terms of tenancy are as follows: First, equal-share farming, each furnishing half; second, everything furnished, giving tenant one-third; third, tenant furnishing everything and giving one-third; fourth, cash rent. The opportunities for purchasing on shares while hiring out are scarce.

EATON COUNTY.—Opportunities for renting all depend upon ability; steady, sober men who understand farming can find situations here. Purchasing while hiring out is done by thrifty men, but there are better localities for such than this.

KENT COUNTY.—Opportunities for purchase are very good.

LAPPEER COUNTY.—Nearly all farms are rented each year. Both cash and crop rent. Opportunities for a poor man to establish himself in independent farming are good for the right kind of a man.

MECOSTA COUNTY.—There are fine opportunities for renting. Renter receives one-third of the crop. Land is cheap here yet, and there is some homestead land. An industrious man with a small family can easily raise his living for the first year on these lands. He can work out on every spare day during the season.

OCEANA COUNTY.—There are good opportunities for renting. One-third goes to the landlord; two-thirds to the tenant, who furnishes all. There are good opportunities for purchase. Land is cheap and there is plenty of work.

IOSCO COUNTY.—Opportunities for renting are limited. A few farms are rented at a cash rental of from \$1 to \$2.50 an acre. They are generally rented on shares. There are reasonable opportunities for purchase. A few good lands can be secured under the homestead laws of the State and of the United States.

CHARLEVOIX COUNTY.—A few farms can be rented either on shares or for a cash rent. As to purchasing while the purchaser hires out, many are doing so, as stump land can be bought for \$5 an acre.

WISCONSIN.

(See table, p. 601.)

The commissioner of labor for the State wrote as follows in 1894 as to the opportunities for immigrants in the State at that time.¹

I can state that the northern part of our State has fine timber lands that when improved will make the best of farms, and immigration in that part of the State would be very desirable, providing, first, the persons arriving had a small sum of money to invest in the purchase of land, which is very cheap. In that part of the State, in fact, most any and everything can be raised, including wheat, oats, barley, potatoes, and vegetables of all kinds.

Our State, in my judgment, would prefer the German, for the reason that as a rule they all work and are generally very prosperous with us.

As to the conditions to-day, the secretary of the State board of immigration writes the following:

Wisconsin, with its diversified industries, offers better opportunities to-day to the immigrant than was offered during the years of industrial depression in our lumber and mining industries. The same is true in practically every line of business; everything so dovetails in together that depression in one line of industry means depression in another.

Second. Germans and Scandinavians are most effective as farmers and farm laborers.

The success of the foreign farmers, if German and Scandinavian, is greater than that of American-born. The Germans or Scandinavians of foreign birth who come here first come from a depleted soil. They grub, dig, and save, and soon put their small farms on a paying basis, and eventually die fairly well to do. Their children do not seem to have the same ambition that the old folks have, and do not work as hard or accomplish as great results. But the grandchildren are more thoroughly Americanized, and seem to do better than the fathers did. American-born children are not content to cultivate small farms, and do not cultivate the large farms to get all out of them that it is possible to get. A part is cultivated and the remainder neglected.

Fourth. We have so much unoccupied land as yet in this State that farmers are glad to see further immigration to the State.

Fifth. The State board of immigration of Wisconsin expends about \$5,000 a year in advertising and showing to intending settlers the benefits that can be derived by settling, especially in northern

¹Report Immigration Investigating Commission, p. 151.

Wisconsin. We are not doing anything in the way of trying to attract foreign immigration, but are attempting to draw settlers from older and more thickly settled States. Certain railroads and private land companies are engaged in the work of settling land in northern Wisconsin. There are probably one hundred such firms doing business in northern Wisconsin. There are no agricultural colonies in the State, but there are numerous sections in the State in which Germans, Scandinavians, or Poles prevail as a nationality in such settlements.

The great timber region in the northern part of the State where especial opportunities are offered to settlers is comprised in an area north of a line drawn from Green Bay to the mouth of the St. Croix River, with the counties of Portage, Wood, and Jackson as southern projections, and contains 27 counties occupying about 53 per cent of the area of the entire State. It appears that, considering the whole area from a farmer's standpoint, about 20 per cent is good farming land, about 40 per cent is medium, while 40 per cent is either not suited to farming or only doubtfully so.¹ Of the 18,500,000 acres contained in this tract a little less than 7 per cent is improved. Twenty-four per cent of the total area is held by actual settlers, 5 per cent by the United States (2 per cent being Indian reservations), less than 2 per cent by the State, a little over 5 per cent by the railways, leaving 63 per cent held by private nonresidents. Of the land so held 80 per cent, or about 50 per cent of the total area under consideration, is owned by lumbermen.² Of the 17,000,000 acres of unimproved land 8,000,000 are "cut-over" lands, largely burned over and waste.³ This area is constantly growing.

It is to these lands in especial that attempts are now being made to bring settlers. An interesting experiment has been tried to get foreign residents of cities upon such lands. The following letter from the State commissioner of labor statistics gives some account of this:

The ——— Land Company has been settling Polish people in the northern counties of the State for the past 14 years, and up to the present time has sold land to about 1,000 people, as near as they could estimate it. All of these people have settled in the counties of Shawano, Brown, and Oconto. They came from Chicago, Indiana, and the mining regions of Illinois and Pennsylvania (very few came from Milwaukee). All had accumulated some savings which were made at various occupations in the cities of this country (principally laboring). The land company sold them the land upon payment of a small sum down and the balance to be paid in from 3 to 5 years with interest at 6 and 7 per cent. In every case these people have made a success; so much so that (the manager of the company tells me) most of their sales in the past few years have been to the people who purchased land several years ago and have since paid for it and added more to their holdings. The average price paid for the land was about \$11 per acre.

From the ——— Land Company I learned that during the 24 years they have been in business they have sent 71 families into Marinette County exclusively, with an average of 6 people to a family. These people came principally from the city of Milwaukee, although some of them were from Detroit, Cleveland, Chicago, Hammond, Ind., and the mining regions of Pennsylvania. These people were painters, carpenters, masons, farmers, and laborers, and in every case had saved some money which they had accumulated at these occupations in this country. Their average holding is 80 acres, and the cost \$6 per acre, average. The terms of the land company were one-half of purchase price down and the balance in 5 years at 7 per cent. These terms were complied with in every case. From the start these farming ventures seem to have been self-sustaining, for in no case has any of them asked for financial assistance. At the present time there are people on their way from Poland to settle on land in Marinette County.

The following letters from private land companies operating in this region give an idea of how far the opportunities they offer are available for immigrants and what their methods are:

1.

Most of the settlers whom we place on our lands in Wisconsin are farmers from the farming districts of the more improved parts of Wisconsin, Illinois, Indiana, and a few from Ohio. We are getting a large number this year from the State of Iowa, as we have had a few before.

As for foreign immigration, we have had a man in Europe for the past 3 years, our Mr. ———, who is stationed at Copenhagen, Denmark. We have been working on a Russian colony from Odessa. We had a delegation here last summer and they looked over our lands, staying here 4 or 5 weeks. We have brought one German Russian from Odessa and settled him in Clark County. He had plenty of means to buy a good farm. We have not directly handled any foreigners from New York. We can take care of a thousand farmers in two weeks' time by putting them on our lands in Clark, Chippewa, Price, and Sawyer counties, Wis.

Most of the foreigners here are Germans and Norwegians. The Germans and Norwegians are coming steadily, not only from Europe but from the more thickly settled districts in the territory above mentioned. We are selling good agricultural lands at from \$5 to \$10 per acre, unimproved, in Wisconsin. We have done lots of advertising. We have sent over 200,000 circulars to Europe, and we are using several hundred thousand a year in this country. We have men out on the road taking up renters who want to buy land in the States above mentioned.

The lands we offer are what are called cut-over lands. The lumbermen have taken off the most valuable and merchantable timber and left the land to be cleared and cleaned up and tilled by the farmer, consequently our work is slow and steady and the margin small. We never sell land for more than it is worth; land is enhancing in value all the time.

Respectfully,

——— LAND COMPANY.

¹Forestry conditions of northern Wisconsin: Filibert Roth, special agent, U. S. Department Agriculture. Wisconsin Geological and Natural History Surveys, Bulletin No. 1, E. 8. Series, No. 1, p. 6.

²Ibid., p. 6.

³Ibid., p. 55.

II.

We inclose circular descriptive of the lands we are offering in this State. In addition to the lands described in this circular we own a number of large bodies of lands that we have not yet placed upon the market. Lands described in the inclosed circular are situated in a well-improved farming portion of the State, and we have made no effort so far to settle them except with farmers from this and surrounding States. There have, however, settled upon our land a number of families of Hollanders, probably 30 or 40 families, some of whom have doubtless come direct from the old country. Should we decide to place some of the other lands which we own upon the market, we will doubtless endeavor to induce newly arrived immigrants to settle upon them.

Yours, truly,

— & —.

III.

We have not heretofore dealt with newly arrived immigrants. Our sales have been made altogether to American farmers or to men of foreign birth who have been long settled in the United States and become citizens thereof. We have, of course, a number of Germans and a few Scandinavians among our customers.

We should be pleased to deal with the newly arrived immigrants. Our lands are what are denominated cut-over timber lands. In most instances they were cut-over many years ago, and the process of time and decay has greatly facilitated the work of clearing the land for the plow; fires having kept back the second-growth timber, which in most places is not large enough to be classed as other than underbrush.

The swales are covered with the growth of natural blue-joint grass which makes excellent pasture and hay. The grass crops are of excellence the best for this section, but Indian corn also makes invariably a good crop, ranging from 35 to 90 bushels per acre on the best cultivated farms. Winter wheat is also an excellent crop, as are oats, rye, and vegetables of all kinds.

The expense of clearing the land and putting under plow does not exceed \$5 to \$7.50 an acre. There is plenty of firewood for fuel. Soil is a sandy loam with clay subsoil. We are prepared, in case an immigrant is a farmer and has some means, to build for him a small comfortable house and barn on each quarter section that may be selected by him. We should require, in such case a cash payment sufficient to cover a little more than the cost of such building, and should expect to carry the balance for such time as might be convenient for the purchaser, provided he proved industrious and self-helpful.

— FARM LAND COMPANY.

IV.

I would say that my land agency does not reach for newly arrived immigrants. We have been dealing thus far with people who have been settled in some adjoining State or in the southern part of this State. We have located a good many of them on improved and unimproved lands in this and adjoining counties. They are mostly German, Norwegian, and some Danes. I have reached my purchasers largely through advertising in the German, Norwegian, and American papers. The price of our lands ranges from \$5 to \$50 per acre, depending upon the improvements and localities. The unimproved lands we sell at about one third cash where the buyer moves on to make improvements at once, and the balance of the purchase price to be paid at any future day agreed upon that would be satisfactory to the purchaser. On this land we can raise hay, corn, barley, rye, wheat, oats, sugar beets, tobacco, and most any kind of grain or vegetables that can be grown in the Northwest.

Yours, very truly,

— — —.

It was stated above that about 5 per cent of the land in the northern part of the State was held by the railway companies. These companies are doing more or less in the way of attracting foreign immigrants, as the following letters will show:

V.

This company has probably been doing more advertising for the past two years than all other land-owners put together in this State. Our base of operation has been wholly within the United States, and more particularly in the southern part of this State, northern Iowa, Illinois, Indiana, Ohio, and southern Michigan. We are distributing a large amount of printed matter, doing considerable advertising in newspapers, and have a stereopticon show which gives free entertainments showing pictures of that portion of our line passing through the land grant. The lecturer describes each town of importance, giving views of industries, principal streets, and such other matters of interest as seems best.

We have something over half a million acres of good farm lands which are being offered at from \$5 to \$7.50 per acre. The crops for which the land is suitable chiefly are wheat, oats, rye, roots, and vegetables. The soil is perhaps better adapted to raising the different grasses than any other part of America. Sheep and cattle breeders are coming to us very rapidly. Our experience teaches us that Germans, Norwegians, Swedes, and Bohemians, and such other foreigners as were farmers in the old country, make the best success of clearing timber lands.

Yours, truly,

W. H. KILLEN,

Land Commissioner Wisconsin Central Railway.

The pamphlet issued by this company speaks of settlements in given localities of Swedes, Norwegians, Finlanders, Bohemians, and French Canadians, and offers to direct to the proper districts those who desire to take up homes in a settlement of any special nationality.

Another company points out some difficulties in the way of settling foreign immigrants on timber land. The land commissioner of this railway writes as follows:

VI.

Our company owns in the neighborhood of a half a million acres of land in northern Wisconsin and Michigan, which we have just recently commenced to open up for settlement. It is almost entirely heavily timbered hard-wood land, and we have not yet arrived at any systematic method of inducing

foreign emigrants to locate. The proposition of locating settlers on timber land is quite a difficult one. Most of the land that is being sold is sold to people who have had some experience in a timber country; and until the lands are cleared, to a certain extent, I presume that this will be their history, and that the method of handling them will be entirely along these lines.

Yours, very truly,

J. F. CLEVELAND,
Land Commissioner Chicago and Northwestern Railway Company.

The land agent of the Chicago, Milwaukee, and St. Paul writes:

Some years ago this company distributed a considerable amount of literature published in English, German, and Norwegian. They were in the form of pamphlets, and were sent broadcast over the various countries. To-day this company is, through an auxiliary known as the Milwaukee Land Company, interested in the development of new towns located on extensions of various lines.

These towns and the territory this company is advertising by means of pamphlets. We also use the press in a general manner as well as a small army of agents.

In these towns there are opportunities for the merchant, the artisan, mechanic, and laborer. The rates of wages are above the average, while living is quite cheap.

As to the manner by which this company induces foreign immigration, I must respectfully refer you to our general passenger and ticket agent, Mr. F. A. Miller, of Chicago. Such matters pertain particularly to his department. I can locate the immigrants after they are brought to me, and between the two departments we have been very successful. We are not confined to any particular nationality. This company owns about 6,600 miles of road, and the foreign element seem to move in squads, and are usually cognizant of the locality in which they are about to settle, seeking information presumably by correspondence with their friends.

Respectfully, yours,

C. A. PADLEY,
General Land Agent.

The general immigration agent of the same road writes as follows:

VII.

Very little effort has been made during the last 12 years to induce immigrants from Europe. They come through the influence of friends mostly. We have an agent (special) in Liverpool. The general European agency was abolished 12 years ago. Our company has colonized over 200,000 people in the Dakotas of different nationalities during the last 18 years, and fully the same number in Minnesota and Iowa. We are colonizing very successfully in northern Wisconsin now of different nationalities as mentioned.¹ I find that they succeed much better in timber country than on prairie land.

Yours, truly,

W. E. POWELL, G. I. A.

The Chicago, St. Paul, Minneapolis and Omaha Railway has about 300,000 acres of land remaining unsold, suitable for general crops and diversified farming. The price ranges from \$2.50 to \$5 per acre. The land commissioner of the road writes:

We are selling our lands to all classes; most of our customers come from the settled portions of southern Wisconsin, northern Illinois, southern Minnesota, Iowa, Nebraska, and Dakota. We have made some sales to foreign immigrants, though not very many; Germans and Scandinavians are the prevailing nationalities.

Yours, respectfully,

G. W. BELL, *Land Commissioner.*

From the point of view of the student of foreign settlements and settlers in the United States, Wisconsin is especially interesting for the number of races represented within its borders, and for the high proportion of the foreign element in its population. Prof. Reuben G. Thwaites, corresponding secretary of the State Historical Society of Wisconsin, has been carrying on an investigation into the history, numbers, etc., of the foreign races represented in the population of the State, and under his direction several monographs on different races have already appeared. These are: "The Cornish in Southwest Wisconsin," by Louis Albert Copeland; "The Belgians of Northwest Wisconsin," by Xavier Martin; "The Planting of the Swiss Colony at New Glarus, Wisconsin," by John Luchsinger; "How Wisconsin Came by its Large German Element," by Kate Asaphine Everest; and "Geographical Origin of German Immigration to Wisconsin," by Kate Everest Levi.²

The following briefly summarized account of foreign groups in Wisconsin, and their distribution, is quoted from Professor Thwaites's annual report for 1890, presented as secretary of the historical society after the investigation had been under way about 18 months. Professor Thwaites says:

Wisconsin probably contains a greater variety of foreign groups than any other American State. The principal nationalities now colonized here rank in numbers as follows: Germans, Scandinavians, Irish, natives of Great Britain, Canadians, Bohemians, Dutch, and French. Many of these foreign groups occupy entire townships, and control within them all political, educational, and religious affairs. Here and there we find genuine communities where property is held in common, and from which strangers are carefully excluded; such as the St. Nazianz German Catholic community, in Manitowoc County, where there are men of all essential trades and professions, and where, according to our informants, no communication is held with the outer world if it can be prevented. In considerable districts, particularly among the Germans and Welsh, the English language is reported to be seldom spoken, and public as well as parochial schools are conducted in the foreign tongue. But as a rule the foreign-born people of Wisconsin appear quick to adopt American methods and English speech, and enter with zest into the privileges and duties of citizenship; while no matter

¹Scandinavians, Germans, Bohemians, Poles, and English-speaking people.

²All published by the State Historical Society of Wisconsin, Madison, Wisc.

how stoutly the elders may endeavor to perpetuate the foreign ideas which they have brought with them the younger generation can not long be held in leash, complaint being universal in the replies to our circulars that the teachings of the fathers in these matters appear to have but little effect upon youth. The process of assimilation appears to be, as a whole, reasonably rapid and satisfactory. New customs, new manners, new blood are being introduced by the colonists from across sea, and as a rule these are worthy of adoption and absorption.

It is interesting to note the localities where these foreign groups have planted themselves.

Germans.—The Germans number 75 per cent of the population of Taylor County, 65 per cent of Dodge, and 55 per cent of Buffalo. They are also found in especially large groups in Milwaukee, Ozaukee, Washington, Sheboygan, Manitowoc, Jefferson, Outagamie, Fond du Lac, Sauk, Waupaca, Dane, Marathon, Grant, Waushara, Green Lake, Langlade, and Clark counties. There are Germans in every county of the State and numerous isolated German settlements, but in the counties named these people are particularly numerous. Sometimes the groups are of special interest, because the people came for the most part from a particular district in the Fatherland. For instance, Louisa, in Dodge County, was settled almost entirely by Prussians from Brandenburg, who belonged to the Evangelical Association. The neighboring towns of Herman and Theresa, also in Dodge County, were settled principally by natives of Pomerania. In Calumet County, there are Oldenburg, Luxemburg, and New Holstein settlements. St. Kilian, in Washington County, is settled by people from northern Bohemia, just over the German border. The town of Belgium, Ozaukee County, is populated almost exclusively by Luxemburgers, while Oldenburgers occupy the German settlement at Cedarburg. Three-fourths of the population of Farmington, Washington County, are from Saxony. In the same county, Jackson is chiefly settled by Pomeranians, while one-half of the population of Kewaunee are from the same German province. In Dane County there are several interesting groups of German Catholics. Ruxbury is nine-tenths German, the people coming mostly from Rhenish Prussia and Bavaria. Germans predominate in Cross Plains, the rest of the population being Irish. The German families of Middleton came from Köln, Rhenish Prussia, and so did those of Berry, a town almost solidly German.

Scandinavians.—The Scandinavians (Norwegians, Swedes, Danes, and Icelanders) of Wisconsin are divided into national groups. The Norwegians are strongest in Dane County, where there are probably not less than 14,000, who were either born in Norway or whose parents were. Other counties having large numbers are Pierce, St. Croix, Eau Claire, Waushara, Waupaca, Washburn, Winnebago, Portage, Buffalo, Trempealeau, Barron, Door, Bayfield, Florence, Lincoln, Rock, Racine, Milwaukee, Grant, and Oneida.

Swedes predominate in Trenton, Isabel, and Maiden Rock, in Pierce County, and are strong in portions of Bayfield, Douglas, Price, Taylor, Door, Jackson, and Portage counties. Danes are found in considerable groups in Adams, Milwaukee, Racine, and Waushara counties. Icelanders practically monopolize Washington Island (Door County), in the waters of Green Bay.

Bohemians.—The Bohemians are settled for the most part in the counties of Kewaunee (where they form three-sevenths of the entire population), Marathon, Adams, Crawford, Grant (towns of Muscoda and Castle Rock), Columbia (Lodi), Trempealeau, Langlade, and Washington (part of Wayne).

Belgians.—We find Belgians closely massed in the towns of Gardiner, Union, and Brussels, in Door County, Red River, and a large part of Lincoln, in Kewaunee County, and in Brown County.

Polanders.—The Polanders are wide spread. In the cities of Milwaukee and Manitowoc there are large masses of them. In the city and neighborhood of Beaver Dam, Dodge County, there are 900 Poles, mostly from Posen, Germany. In Berlin and its neighborhood are 1,200 from Danzig, and immigration from thence is still in active progress. There are 2 Polish churches in Berlin, and 1 Polish school in which that language is taught. Other solid Polish groups are found in the townships of Berlin, Seneca, and Princeton. Warren Township, in Waushara County, has a considerable colony of Poles, and others can be found in Trempealeau, Door, Kewaunee, Portage, Marathon, Langlade, and Buffalo counties.

Welsh.—The Welsh are planted upon our soil in large groups. In Waushara County we find the town of Springwater, one-half of the town of Rose, and one-half of Aurora occupied by natives of Wales and their immediate descendants. Spring Green, in Sauk County, has a large colony of them. The whole of Nokini and the greater part of Utica, in Winnebago County, are settled by this people. So are Caledonia and other townships in Columbia County, and the town of Calumet, in Dodge. Monroe County has many solid Welsh neighborhoods, and other compact groups are found in the Third and Sixth wards of Racine.

Italians.—Italian groups are noted in Vernon, Washburn, and Florence counties. In Vernon they hold one-half of Geneva Township.

Russians.—Russians, both Greek Church adherents and Jews, are chiefly found in the city of Milwaukee. Of the Greek Church Russians there are 2,000 in number living on one street in a densely settled neighborhood and said to be mainly engaged in peddling small wares. The Russian Jews are scattered throughout the city; they observe their old social customs with religious tenacity, but are allowing their children to become Americanized.

Dutch.—The Dutch have particularly strong settlements in the northeastern portion of the State, in the city of Milwaukee, and in La Crosse County. The first colony settled in Hollandtown, Sheboygan County, where natives of Holland still own one-fourth of the township. They own one-half of Barton, in Washington County. Alto, Fond du Lac County, is essentially a Dutch town. A considerable stronghold is in the town of Kaukauna, Outagamie County, and the Dutch own much of Depere and Belleville, Brown County. The city of Milwaukee had as early as 1849 a Dutch population of more than 800, which has since greatly increased; they are strongest in the northwest portion of the city, formerly known as "Kilbucktown." There is a large settlement of Frisians in Holland Township, La Crosse County, their village being known as New Amsterdam.

Swiss.—There are between 5,000 and 6,000 Swiss massed in exceptionally prosperous colonies in New Glarus, Washington, Exeter, Mount Pleasant, York, and neighboring townships in Green County. Others may be found in the counties of Buffalo, Pierce (Union), Winnebago (Black Wolf), and Fond du Lac (Ashford).

Irish.—Irish groups are found in Bear Creek, Winfield, and Dellona, in Sauk County; Osceola, Eden, and Byron, in Fond du Lac County; Benton, Darlington, Gratiot, Kendall, Seymour, Shullsburg, and Willow Spring, in Lafayette County; Lebanon, in Waupaca County; Erin, in Washington County; El Paso, in Pierce County; and Emmet, Shields, and Portland, in Dodge County.

English.—Large English settlements, several of them the result of the early immigration of Cornish miners into the lead regions of southwestern Wisconsin, can be found in Iowa, Grant, Lafayette, Columbia, Juneau, and Dane counties.

Scotch.—The Scotch we find in considerable numbers in Columbia, Buffalo, Green Lake, Kenosha, Marathon, and Trempealeau counties.

Finlanders.—Finlanders are quite strongly grouped in Douglas County.

Austrians.—Austrians are numerous in Kewaunee County.

French.—The principal French-Canadian settlements are in Bayfield, Crawford, Lincoln, St. Croix, and Taylor counties, not counting the French Creoles at Green Bay, Kaukauna, and Prairie du Chien.

The matter of geographical distribution of nationalities and the many changes therein is an interesting one, and the map illustrating this, which is now being prepared, will be of great practical value to the student of colonization. Waupaca, for example, is one of the counties remarkable for its distribution. In the eastern half the Germans now predominate in all the townships except Lebanon and Matteoson. In Lebanon the Irish are still strongest although they are being slowly displaced by the Germans, who are indeed gaining all along the line; it is worthy of note that the Germans have frequently displaced large bodies of Irish settlers in the southeastern portions of the State. Matteoson Township is held by a mixture of Germans, Norwegians, Irish, and Americans. The western townships of Waupaca County, with the exception of the 3 southwestern—Farmington, Dayton, and Lind, where Americans predominate—are almost exclusively Scandinavian; but even in the American towns there is a large contingent of Danes, and Americans are losing ground.

Enough has been given to exhibit the scope of the inquiry and the progress made. We are slowly building up in America a composite nationality that is neither English nor continental, but partakers of all—it is to be hoped, the best of all. This investigation into the details of the forces at work in a representative State, and the manner of their working is, we believe, of the utmost importance and significance, and when the results are finally presented to the public they are certain to command the general attention of students in history and economic science.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported from representative farmers.)

WAUKESHA COUNTY.—Opportunities to become a tenant farmer here are not very good. Most farmers are working their own land. Opportunities for purchase are not good, as land is very high.

JEFFERSON COUNTY.—Good men, who have proved themselves such, can become tenants. They must be able to furnish tools and some farm implements. Tenant receives half the produce, a house to live in, etc. Land is so high in southern Wisconsin that the opportunities for a poor man are not very good. It would be a life-long struggle to get on a farm.

IOWA COUNTY.—Not many opportunities for renting for new beginners. As soon as they give evidence of ability, good opportunities, especially for those with a small amount of capital. Opportunities for purchase are not as good as farther south.

WAUPACA COUNTY.—Plenty of chances for renting. If tenant and landlord each furnish half, each receive half; if tenant furnishes all, receives two-thirds.

VERNON COUNTY.—There are not many opportunities to rent farms. Tenant furnishes one-half of everything and receives one-half of the crops. As to purchase, many a poor Norwegian boy comes here, works hard, and in a dozen years owns a fine farm. Land is higher here than formerly owing to the tobacco industry.

ADAMS COUNTY.—(1) There are good opportunities for renting farms on crop and cash rent. There are fine opportunities to purchase land in this locality. Unimproved lands, good soil, can be had at from \$5 to \$10 an acre on easy terms. (2) Not very good opportunities for a poor man to rent. Terms, one-half to one-third of crop as rent to landlord. There is not much land for sale here. There are better opportunities for immigrants to purchase in the middle and northern part of the county. There the land is poorer and many farmers are anxious to sell. A German or Bohemian will get rich on the farm that the American starved and went ragged on.

WOOD COUNTY.—There are some opportunities for renting—generally for half the crops—and very good opportunities for purchase while hiring out. In fact, that is what nearly all have done who have come here in the past.

CLARK COUNTY.—Farming land is rented generally for one-third of the crop, or otherwise, according to agreement. Nearly all of the people now settled in this vicinity acquired their land by purchasing on payments while hiring out, but at present there are few such chances.

EAU CLAIRE COUNTY.—There are good opportunities for renting. Many farms are to be had for from \$2 to \$4 an acre, or half the crop. There are good chances for purchase. There is much unimproved land that can be bought on terms to suit purchaser, and good chances to work near by.

DUNN COUNTY.—Some very good opportunities for renting, either on cash rent or shares; usually half the crop and increase. There is much good land for sale at reasonable prices. An industrious man who will manage fairly well can get a home in this section.

POLK COUNTY.—Many opportunities for renting, and on easy terms. Many chances for purchase, but they are being taken much faster than formerly. Timber lands as good in quality as any, but stumpy.

TAYLOR COUNTY.—Some chances for renting, on halves. Good opportunities for purchase. Land is cheap, \$3 to \$10 an acre.

ONEIDA COUNTY.—There are farms to let, and wild or unimproved lands which can be purchased at from \$2 to \$5 an acre. There are opportunities for winter employment at good wages.

ASHLAND COUNTY.—Not much opportunity for renting, but good opportunities for purchase. Plenty of good land and improved farms on easy terms. Work can be had at any time.

WASHBURN COUNTY.—There is not much chance here for tenant farming, as most of the people are clearing new farms. The chances are good for a man to get a good start to buy land selling the timber off of it. There is a good market for wood. Such wood, dry, is worth \$1 a cord.

MINNESOTA.

(See table, p. 603.)

Reports from representative farmers in this State were received from 7 counties only. In all there was said to be opportunity for non-English-speaking immigrants; in two the opportunities were thought not to be great. Scandinavians and Germans, Poles and Bohemians, English, Irish, and Canadians are the foreign farmers and farm laborers noted in these counties, and preferences for Germans, for Scandinavians, and for Canadians are expressed.

These foreigners are found settled in colonies, and also scattered. It is said that the Germans when settled in colonies (especially under semireligious auspices) are inclined to continue the use of the foreign language in the colonies. The Scandinavians drop their language.¹ They are regarded as a good class of citizens and successful farmers.

From an examination made by Mr. LeGrand Powers, chief of the division of agriculture, United States Census, it appears, however, that with reference to the comparative average progress made by the several elements, American born and foreign born, so far as the inquiry shows anything, the American-born farmer is able, on the farms of Minnesota, to make a slightly greater amount of progress than the foreign born.

The State is not densely populated. Government lands are all taken up, but there are school lands in the hands of the State and much uncleared pine land that will ultimately make good farms.²

The Duluth and Iron Range Railroad has some land to dispose of. The land commissioner of this railroad writes, with regard to their lands and methods of disposing of it, as follows:

We have about 500,000 acres of land, some of it suitable for stock and dairy farming and some good for timber only. Our prices are from \$2.50 to \$5 per acre, payable \$1 per acre down, balance in five annual payments.

We have no preference as to nationality of purchasers. Our customers have been mostly Scandinavians, Finns, and Poles.

We do not meet immigrants on arrival, nor do we have agents in foreign countries. We have not established any colonies.

Yours truly,

B. P. CRANK, *Land Commissioner.*

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

FREEBORN COUNTY.—Good opportunities for renting. A good many farms are rented now and there are more to rent, as the well-to-do farmers are retiring. Terms are cash rent or shares of the product. As to purchase, land is very high, but wages are good and work is plenty.

WATONWAN COUNTY.—Not many opportunities for renting. Terms, one-third of the crop. No chances for purchase by a poor man while hiring out, as land is too high.

MCLEOD COUNTY.—Land is rented on shares. Tenant receives two-thirds of crop and furnishes his own seed, tools, etc., or pays \$2 an acre cash. No chances for purchase. Land is worth from \$25 to \$50 an acre.

STEVENS COUNTY.—There are a few opportunities for renting for men with teams and the necessary machinery. Where tenant furnishes the seed, landlord receives one-third of crop. If landlord furnishes the seed, he receives one-half the crop. Land is now worth from \$15 to \$25 an acre, and when sold on time interest is about 8 per cent. This is not favorable for a poor man to establish himself in independent farming.

PINE COUNTY.—No opportunities for renting, but good land may be purchased cheap.

CLAY COUNTY.—Good opportunities for renting. Tenant receives two-thirds of crop. Good chance to purchase while purchaser hires out if he is industrious and saving.

¹ Testimony of LeGrand Powers, Reports of Ind. Com., Vol. X, p. 180.

² *Ibid.*

KITTSON COUNTY.—Few opportunities for tenant farming on shares. The landlord often furnishes seed grain and the tenant then only gets one-third of the crop. Land can be purchased on crop shares, but land is too dear and interest too high for a laborer to pay for a farm after deducting his living expenses, which are very high.

IOWA.

[See table, p. 604.]

The commissioner of labor of the State, writing to the Immigration Investigating Commission in 1894,¹ said that the immigration of any class of foreigners to the State at that time was very undesirable. Any foreigner who came there and obtained work would displace a citizen of the State.

The secretary of state writes in December, 1900, that there are present greater opportunities for immigrants, especially in farming and manufactures. Germans are found most effective as farmers and farm laborers, but the success of foreign farmers is no greater than or as great as that of the American born. Farmers as a class would oppose the further influx of foreigners. No efforts are being made by the State to bring in immigrants, but corporations attract them on account of the cheapness of their labor.

The table of replies from representative farmers shows that there is some opportunity for foreign immigrants. Eight of the 15 farmers heard from said such opportunities were open; only 1 said, definitely, that there were none. Foreign farmers and farm laborers were noted in almost every county. These were English, Scotch, Irish, Welsh, Germans, Dutch, Scandinavians, Bohemians, Poles, Slovaks, and Belgians.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

WASHINGTON COUNTY.—A good, reliable man would not find much trouble in getting a farm to rent and on satisfactory terms. As to purchase, this depends altogether upon the man. Occasionally a man will do this very thing (purchase his land while hiring out).

MAHARKA COUNTY.—There are farms to rent, each party furnishing half the stock and farm implements and dividing the profits equally. Opportunities for a poor man to purchase land are not very good, as the land is too valuable.

WARREN COUNTY.—There are good chances for steady, industrious men with families to rent farms, either for cash or grain rents. As to purchase, the best plan is to commence farming by renting on shares for two-fifths or one-half of the crop, house, land, and firewood being furnished. A good man can save enough to make payments on the farm or can hire out and save his wages.

ADAIR COUNTY.—Not very good opportunities for renting. Terms, \$2.50 to \$3 cash rent an acre, or one-half of the crop. Very good opportunities for a poor man to establish himself as an independent farmer.

STORY COUNTY.—There are fair opportunities to rent farms. Terms, from \$2.50 to \$4 an acre cash, and for grain from two-fifths to one-half of the grain raised. There are very fair opportunities for purchase, if small cash payments are made.

TAMA COUNTY.—There are plenty of farms to rent on terms of two-fifths of the grain, with \$3.50 an acre for grass land or for farm. Good farms sell at from \$60 to \$100 an acre, with interest at 5 per cent.

BUTLER COUNTY.—There are fair opportunities for renting. Farms rent for cash for from \$2.25 to \$3 an acre; grain rents, two-fifths of the grain; stock farms, one-half of everything. As to purchase while the purchaser is hiring out, it can be done, but would be rather slow work.

ALLAMAKEE COUNTY.—Not very good opportunities to rent. Terms, one-third of crop or \$3 per acre cash. The opportunities for purchase are no longer encouraging, as land is getting too high priced.

CERRO GORDO COUNTY.—There are no opportunities for renting, and none for purchase on easy terms.

CLAYTON COUNTY.—Most tenant farmers pay cash rent. It takes from \$500 to \$1,000 to get started. Land costs from \$75 to \$100 an acre for all well-improved farms. This makes it difficult for a poor man to establish himself in farming.

WRIGHT COUNTY.—Farms can be rented by giving two-fifths of the crop or \$2.50 to \$3 per acre cash. Land is beyond the reach of most poor men with families, prices being \$40 to \$65 per acre.

O'BRIEN COUNTY.—Some opportunities for renting. Rates, from \$2.50 to \$3 an acre cash, or from one-third to two-fifths of the crop, delivered in market.

¹ Report Immigration Investigating Commission, p. 135.

DICKINSON COUNTY.—There are some chances to work on shares for one-half to two-thirds of the crop, and some on cash rent of \$2 an acre. Opportunities for purchase are not very good, as land is high—from \$28 to \$30 an acre.

GREENE COUNTY.—There are plenty of farms to rent, either at a cash rent of from \$2 to \$3 an acre or by giving two-fifths of the crop. Land can be bought by paying one-third to one-half cash down, as much time as is desired being given for the balance, at 5 per cent interest.

CRAWFORD COUNTY.—There are many tenant farmers here. They furnish everything, giving the landlord two-fifths to one-third of the crop. Land has reached such a price that there is no opportunity for a man to purchase while he is earning a living at farm labor.

MISSOURI.

(See table, p. 606.)

Returns received from representative farmers in thirteen counties of the State show considerable diversity of opinion as to opportunities for immigrants. Three would welcome them in neighborhoods where negroes and native whites are the only farm laborers reported, indicating a desire to change from that class of labor, or at least to admit another class to supplement them, as in one instance where there are said to be opportunities for immigrants it is also said that native whites are greatly preferred. Foreign farmers—German, Irish, Scandinavian, and French—are found in every county. They seem to be more frequently found than foreign laborers. Where preference is directly expressed, it seems to be for native whites; while three say they have no preference.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

RIPLEY COUNTY.—Terms of renting—landlord receives half the crops and furnishes everything. Good opportunities for purchase while the purchaser hires out.

TANEY COUNTY.—A tenant with team can rent land, giving one-third of the crop for rent. If the landlord furnishes team, feed, etc., he receives one half the crop as rent. Land is very cheap—\$5 to \$10 an acre for improved land. There is plenty of Government land. Purchaser can get plenty of work at 50 cents a day.

WRIGHT COUNTY.—There are some good chances for tenant farming. But we don't want tenants; we want home owners; and there is the best opportunity in America here for such. Cheap homes can be purchased on almost any terms, by any man who will work, of from 40 to 160 acres. He can have a home of his own and the most pleasant employment—fruit raising.

LACLEDE COUNTY.—Not much opportunity for renting; fair chances for purchase.

PETTIS COUNTY.—Good opportunities for tenant farming and for purchase.

JOHNSON COUNTY.—Tenant farmers owning their teams, farm implements, etc., receive three-fifths to two-thirds of the produce. There would be poor prospect of success in purchasing land while hiring out here.

SALINE COUNTY.—Good opportunities for renting. Crop rent—corn, one-half; wheat, one-third. Cash rent, \$3.50 to \$4 per acre. Opportunities for purchase are not especially favorable.

RAY COUNTY.—Good opportunities for renting. Landlord furnishes land and tools, and gets one-third to one-half of the crop. Not very good chances for purchase. Land is from \$20 to \$75 an acre.

LIVINGSTON COUNTY.—The chances are good for renting. Tenants can get farms for one-half the produce in crib and one-half of the hay in stack. If the farm is well improved tenant will have to pay extra for house and truck patch, say \$3 a month. As to purchasing land on payments by earning a living while hiring out, there are a good many farms sold that way. Where a man has a team and a prospect of making a crop, a man can get work most of the time.

HOLT COUNTY.—Few opportunities for renting. Terms, one-half the crops. Farms are usually all cultivated by the owners and their sons. There are no opportunities for a poor man to establish himself in independent farming. Land is from \$35 to \$75 an acre.

LEWIS COUNTY.—Only a limited number of farms can be rented. There are good chances to buy farms on partial payments, but it is doubtful about getting work to pay for the same.

ADAIR COUNTY.—Very few chances for renting farms or for purchase.

NORTH DAKOTA.

(See table, p. 607.)

In 1890 the density of population of this State was only 2.7 to the square mile, affording abundant room for immigrants. In 1894 the governor's secretary wrote to the Immigration Investigating Commission:

Would say all portions desire immigration of industrious farmers with means enough to start with—say a few hundred dollars.

Population increased 70 per cent between 1890 and 1900, and is now only 4.5 to the square mile, still offering opportunities for settlers. Representative farmers from all parts of the State express the unreserved opinion that there are openings for non-English speaking immigrants. (See table, p. 607.) In no county heard from does the density reach 20 to the square mile. In all agricultural counties are to be found foreign farmers and farm laborers of many nationalities—Germans, Scandinavians, German-Russians, Austrians, Dutch, Belgians, Bohemians, Poles, Irish, Canadians, English, Scotch, French, and Icelanders.

The proportion of laborers employed through the year is somewhat lower than in some States, owing to the large grain farms; but there is considerable stock farming, also, to keep the proportion higher than it would be otherwise. The wages of farm labor are noticeably high.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

RICHLAND COUNTY.—Scores of farms in every township can be rented, three-fourths of produce going to tenant, or one-half if the landlord finds seed and part of other expenses. First-class opportunities for purchase all about.

RANSOM COUNTY.—Very good chances for tenants who are financially equipped to handle large or fair-sized farms, but no opportunities for purchase on especially easy terms.

LAMOURE COUNTY.—Anyone can get land and work on shares, if he can furnish tools and machinery, by paying one-third of the produce as rent. As to purchase, "Young man, go west," is good advice.

MCINTOSH COUNTY.—Terms of renting, one-fourth of the crop. Land is sold on long-time payments, with interest at 6 per cent per annum, and only a small part down.

STUTSMAN COUNTY.—Land can be leased, where tenant furnishes seed, for one-fourth of the crop. Where owner furnishes seed and pays half the cost of threshing, tenant gives one-half of the crop. Tenant always furnishes tools and machinery. Land can be bought by giving one-half the crop each year, sold by the landlord, and proceeds applied on purchase price of the land. Land can be bought on this plan without any cash payment, at from \$8 to \$15 an acre, and purchaser can rent near-by land for the first year or two, or he can get work for himself and tools by the day or by the acre.

BARNES COUNTY.—Good opportunities for renting, usually for half the crop. To a family showing themselves honest and industrious, stock and machinery and other assistance will be furnished on time until they are able to pay from the crop. Opportunities to purchase are very good. A large part of the farmers here got their start by purchasing land on payments while hiring out.

CASS COUNTY.—Landlord furnishes everything except stock, machinery, and labor, and receives half the crops. Good opportunities for a poor man to establish himself in independent farming.

GRIGGS COUNTY.—Good, live men can always get land to work and find themselves or found everything. Rather poor opportunities for purchase.

GRAND FORKS COUNTY.—As soon as a man has money to buy 4 horses he can get land on shares. Landlord furnishes seed and pays part of threshing bill. Tenant does the work and receives half the crop. To purchase, a purchaser must have a few hundred dollars to start on, say \$500. He would fail otherwise.

WELLS COUNTY.—There are always opportunities for good tenant farmers, on either cash rent or share of the crop—usually the latter. Opportunities for a poor man to establish himself as an independent farmer are good, either by Government land on a homestead claim or buying on crop payments.

BENSON COUNTY.—First-class opportunities for renting. Usually tenant receives half of the proceeds, landlord furnishing seed and paying half of the ordinary expenses aside from the help. First-class opportunities for purchase. Men can take up Government land or buy on a crop payment, turning over one-half the crop to apply on purchase price.

PEMBINA COUNTY.—Many farms are to let, and an industrious man can do well renting. General terms are one-half the crop, owner furnishing seed and paying for

half the thrashing. Good opportunities for purchase; no country in the world has greater opportunities. A great many people who own land would part with it on easy terms.

EMMONS COUNTY.—Opportunities for renting are plenty, but poor chances for tenants, as crops average poor. Land is cheap yet, and Government land still vacant, so that anyone can get a piece of land, although comparatively worthless.

BURLINGHAM COUNTY.—Good opportunities for renting on terms of about one-third of the crop. The best possible chances for purchase on payments while hiring out.

BOTTINEAU COUNTY.—Good chances for renting. Terms are varied, but the most prevalent are for the tenant to find his own seed and receive two-thirds of the produce.

WARD COUNTY.—Good opportunities for renting and for purchase.

BILLINGS COUNTY.—No general farming is done here

SOUTH DAKOTA.

(See table, p. 609.)

In this State, as well as in North Dakota, there appears to be abundant room for immigrants. The density of population for the State was 4.5 to the mile in 1890, and 5.2 in 1900, the population having increased 16.8 per cent. Representative farmers in ten of the eastern¹ (farming) counties (see table, p. 609) are practically unanimous in offering encouragement to non-English-speaking immigrants. Only one discourages their coming, saying that there is no chance this year on account of drought. One correspondent from the stock-raising counties west of the Missouri River writes that there are openings for immigrants, especially on sheep ranches, and one correspondent from the Black Hills, also a stock-raising district, writes that opportunities are at hand there.

Foreigners are reported as farmers and farm laborers in all counties where farming is carried on, and are of the usual nationalities found in the Northwest—Germans, Scandinavians, Russians, and Bohemians, with some Belgians, Dutch, Finns, Irish, and Scotch.

The growth of stock-farming is apparently giving rise to a greater demand for labor throughout the year. Opportunities for married laborers are fairly good, but there is little or no work for women and children.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CLAY COUNTY.—Tenants pay one-third of crop or pay cash, or one-half of the crop and have seed furnished. It is better not to attempt to purchase land without capital.

UNION COUNTY.—Terms of renting are from \$300 to \$400 for 160 acres, or one-half to two-fifths share rental. Opportunities for a poor man to purchase are not very good, as land is rather high here.

MINNEHAHA COUNTY.—Chances for renting are sometimes very good. Landlord will furnish team and all farming utensils, seed, etc. Opportunities for a poor man to purchase are mainly through renting on shares.

DAVISON COUNTY.—There are opportunities to rent farms for a cash rent or on shares, and also for purchase while the purchaser is hiring out.

CHARLES MIX COUNTY.—There are good opportunities for renting. Terms, one-half the crop delivered in the bin or crib, the landlord furnishing the seed; or one-third to the landlord if the tenant furnishes all the seed. There are good opportunities for a poor man to purchase.

BROOKINGS COUNTY.—Generally the owner furnishes the seed, pays one-half the thrashing bill, and takes one-half the crop. In some cases the renter furnishes the seed and takes two-thirds of the crop. In both cases the renter furnishes all implements, etc., and performs all labor. A man can purchase land on part payments or on time with cash payments. Usually a man can find employment 8 months in the year.

BEADLE COUNTY.—There are good chances to rent farms at from one-fourth to one-third of the crop. Many purchase land while hiring out. Good land can be had for from \$7 to \$12 an acre.

BUFFALO COUNTY.—Some are renting. They give one-third of the crop. No land is sold on payments.

¹ East of the Missouri River.

SPINK COUNTY.—Farms can be rented by giving one-fourth of the crop, the tenant furnishing everything, or one-half of the crop, the landlord furnishing seed and paying one-half of the thrashing bill. There are fine opportunities for purchase. Land is cheap, costing from \$5 to \$15 an acre. Chances for labor are plenty, at good wages.

POTTER COUNTY.—Opportunities for a poor man to establish himself in independent farming are numerous.

CAMPBELL COUNTY.—There is little renting in this neighborhood, but there is plenty of land which can be had on terms of from one-fifth to one-fourth of the crop. There are fair chances for purchase, either on crop payment or a fixed price. Land is not very high priced as yet.

MEYER COUNTY.—Land is free, and anyone can homestead and start for himself at once.

WASHBAUGH COUNTY.—Not a farming county. Most of it is Indian reservation.

PENNINGTON COUNTY.—(See table, p. —.)

BUTLER COUNTY.—There are good opportunities for renting for men who can manage the work. Terms, one half to one-third of the crop. There are good opportunities for purchase.

KANSAS.

(See table, p. 611.)

Three out of eight representative farmers heard from in the eastern part of this State report (see table, p. 611) that there are no opportunities for non-English-speaking immigrants in their neighborhoods. Two, however, are from the counties in which are situated the two large cities of Kansas City, Kans., and Wichita, and which may be supposed to have less demand for agricultural labor.

Of the six western counties heard from, five afford openings for immigrants (see table, p. 611). The county where immigrants are said not to be wanted is one which is, apparently, entirely devoted to grain growing, and only 10 per cent of the farm laborers are employed throughout the year.

Foreign farmers and farm laborers are found everywhere (except in the small county of Wyandotte, principally occupied by Kansas City, Kans.). Germans are most prevalent, followed closely by Swedes. Stafford County reports a few Danes as the only foreign farmers. Barton County, in the western part of the State, has many Russian farmers. In Ellis County, also in the western part, it is said that "over half the county are foreigners, mostly from Russia, and prosperous." There are Russians in the eastern part of the State also.

The Union Pacific railroad has about 6,500,000 acres of land for sale in the western part of the State at from 50 cents to \$3 per acre for grazing lands and from \$3 to \$15 per acre for farm lands. The land commissioner of this railroad writes:

We have no preference as to where purchasers may come from. We prefer to make sales to persons who will settle upon and use the land.

A very large proportion of our land sales are made to people of foreign nationalities, particularly English, Swedish, German and Russian.

The sales to natives of foreign countries are usually made to them after they have spent some years in this country and have gained a considerable insight into the methods of life and farming in the United States.

We have never found it necessary to attempt to colonize or lands according to nationalities.

We maintain traveling agents whose business it is to travel over the country assigned to them and secure purchasers for our lands. We also maintain local agents at nearly all points along the line of road, who look after the sale of lands within their own district.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reports from representative farmers.)

MCPHERSON COUNTY.—There are some opportunities for tenant farming. Usual rent is one-third of the crop on upland and half on the bottom land. Very poor chances for purchase.

CHASE COUNTY.—Many farms are rented; terms, one-third to one-half share of crops raised, or the equivalent in cash. Farms are regularly purchased on payments. Those who do so usually farm such purchases themselves, making a living therefrom, and using the surplus to make the payment with.

OSAGE COUNTY.—There is considerable land to rent on terms of one-half the standing corn or its equivalent crop, or one-third harvested and delivered. Cash rent is from \$1.50 to \$3 an acre. There is small opportunity for purchase on easy terms on account of recent boom in land prices, and at the present rate of interest would not justify time payments.

WABAUNSEE COUNTY.—Not very good opportunities for renting or for purchase.

DOUGLAS COUNTY.—A good man for farming can rent land and give one-half to one-third of the crops as rent on convenient time and payments, and if he understands dairying, can make money. There are some opportunities for purchase on easy terms.

WYANDOTTE COUNTY.—Most of the land in this locality is worked by tenants. In the main it is farmed for a cash rental, an average of \$6 or \$7 an acre. As to purchasing land on payments while hiring out, it can not be done.

MARSHALL COUNTY.—There are chances to rent good farms at from \$2 to \$3.25 an acre, or on shares for one-third of the crop as rent.

STAFFORD COUNTY.—There are too many tenants already. No opportunities for purchase while the purchaser is hiring out.

BARTOW COUNTY.—Not many openings for renting at present, but there are some good opportunities for purchase.

FORD COUNTY.—Some have tried to pay for land on the plan of paying so much wheat every year. As to purchasing land on payments while earning a living by hiring out, a few could do this, but many would fail as far west as this. It depends largely on the man and his family as to his success.

KRAINEY COUNTY.—Considerable land in irrigation and set to alfalfa can be rented, but land without improvements. Government land can be homesteaded. School land good for grazing and growing of fodder crops, with an occasional crop of corn, wheat and rye can be had for \$1.25 an acre.

ELLIS COUNTY.—Opportunities for renting are good. Tenant can get land with everything furnished him, or he can provide for himself, just as he wishes. Some good chances for purchase. A man can buy a farm here and pay for it by shares of crops.

PHILLIPS COUNTY.—Farms are to rent here on shares of grain or stock. There is plenty of cheap land, and it is the easiest place on earth for a man to make a living.

NEBRASKA.

(See table, p. 613.)

The State commissioner of labor, writing to the Immigration Investigating Commission in 1894, says:¹

Generally speaking, under present industrial conditions there is no demand for labor of any kind, skilled or unskilled, but there is every inducement for foreigners of the right sort seeking homes in the rural districts.

The agricultural resources of the State are still in their infancy, and for years to come there will be room for industrious, self-supporting immigrants who desire to make country homes.

The eastern portion of the State is fairly well populated, though there is still room for immigrants possessing means sufficient to live for one year and purchase needed implements for agricultural pursuits.

The broad prairies of the central and western portion of the State are capable of supporting a much denser population than at present. The drought and consequent failure of crops the present season may seem to contradict this statement, but that is but a temporary misfortune, shared in, to a greater or less extent, by other States farther east which never before lacked moisture for maturing crops. The present dry season has been the means of creating a system of irrigating canals west of the ninety-seventh meridian, which will surely result in cutting up the large tracts of land now in the hands of single owners and converting them into small irrigated farms.

Nebraska produces all the cereals and root crops known to the temperate zone, but corn has been considered the standard crop. The sugar beet is destined to be the most profitable crop in the future.

Nebraska soil has been declared by experts to be equal, if not superior, to any other soil in the world for the production of the sugar beet. There are two large sugar factories in the State, owned by the Oxnard Company—one at Grand Island, in Hall County, and one at Norfolk, Madison County. Irrigated lands and the culture of the sugar beet mean dense population.

As to the nationalities desired, the commissioner writes as follows:

(1) *Scandinavians.*—They are, with the proper restrictions, as pointed out by you, nearly always industrious, consequently prosperous, and more readily adopt our habits and customs. They soon become real American citizens.

(2) *Germans.*—As Germany is a sugar-beet country and many German immigrants are skilled in the culture of the beet, Nebraska can take care of many thousands. There are but few Germans in Nebraska who are not prosperous and contented.

(3) *Irish.*—The tendency of the Irish is to drop into the cities; but as our cities grow, an increasing number of the Irish immigrants can be assimilated.

¹ There are but few other nationalities really desired in this State. All immigrants (restricted as above) from northern or northwestern Europe will be welcome.

The deputy commissioner of labor, writing to the Industrial Commission in the present year, says:

First. I would say that there are splendid opportunities in this State for immigrants to engage in farming and the raising of stock, this being almost purely an agricultural State.

Second. I would say that the nationalities which seem to be most effective in this State are Germans, Bohemians, Swedes, Norwegians, and Danes.

¹ Report Imm. Inv. Com., p. 144.

Third. I should say that the success of the foreign farmers in this State is, as a rule, greater than that of native-born farmers. As a general thing their standard of living is lower than that of the American, and by their habits of thrift and saving, which seem very pronounced, they seem on the whole to be more successful farmers than the native born.

Fourth. I would say that so far as I know there is no feeling whatever against foreigners in this State. They seem to be quite welcome among us, and I am not aware of any disposition whatever to oppose the further influx of foreigners into the State.

Fifth. I would say "Yes" (i. e., the State is encouraging immigration). There are several publications issued in this State, one of which is the report of the board of agriculture, and one the report of this bureau, which is in a measure designed to give the resources and industrial condition in the State, for the benefit of intending immigrants. The railroad corporations of this State also are doing a great deal by publication to invite immigration.

Sixth. I would say that there are no regular colonies in this State, although there are quite a number of counties in which will be found settlements of foreigners.

Yours, very truly,

S. J. KENT, *Deputy Commissioner.*

Representative farmers confirm the statement of the deputy commissioner that there are openings for immigrants; only two out of nine heard from saying that there is little or no opportunity for them. (See table, p. 613). One correspondent urges, however, that some plan should be devised whereby the wants of the farmer and the terms he offers should be made known, and whereby these wants, in the way of labor, should be met. "Many of the farmers who come here," he says, "are not farmers—know nothing of farming—and would be better elsewhere." English, Irish, Scotch, German, Scandinavian, Bohemian, Russian, and French farmers and farm laborers are spoken of in the different counties, and considerable preference for Germans and Swedes as farm laborers is expressed. As to foreign farmers, one correspondent writes: "Farmers of these nationalities (Germans, English, Irish, Scotch, Swedes, Danes, and Bohemians) have been here from 15 to 40 years, and are among our wealthiest and best farmers."

The Burlington Road has been interested in bringing settlers to the State. The general passenger agent writes:

A limited amount of land, suitable for agricultural purposes, is still owned by this company in Nebraska.

We have no special machinery for reaching foreign emigrants on their arrival in this country; neither have we any agencies in Europe, but depend altogether upon advertising and personal effort in this country to attract farmers of all classes to the trans-Mississippi country, where land is cheap and conditions so favorable.

The assistant land commissioner of the same road gives further information as follows:

The Burlington road has only a small remnant of about 16,000 acres of land now remaining unsold. There is, however, a great deal of excellent land for sale at very reasonable figures all along the lines of this company's road owned by private parties.

The soil and climate of Nebraska are such that all things that grow in this latitude (40 to 42 degrees north) anywhere else in the United States can be raised with success here. Our principal products are corn, wheat, oats, rye, barley, potatoes, grasses, clovers, especially alfalfa, also sugar beets; and, in the way of meat, we produce the best beef, pork, and mutton in the world in the way of quality.

Prices of land vary greatly. In the eastern portions, long settled, prices are higher than most newcomers would be willing to pay. In the central part of the State excellent farming and grazing lands can be purchased at prices varying from \$5 to \$20 per acre that will produce as much to the acre as \$100 land farther east. In the extreme western parts land is very cheap, as it was in the eastern part of the State 25 years ago, so that good grazing lands can be bought in many cases at from \$1 to \$3 per acre.

The railroad company at one time sold on 10-years' time, with 6 per cent interest on deferred payments. Private owners sell in many cases on 5 years' time, with 6 to 7 per cent on deferred payments.

The railroad company has sold to all classes, people from Eastern States, and foreigners. Among people from other States, those living formerly nearest our own borders, in Iowa or Illinois, adapted themselves more quickly to the conditions of a prairie State, and were almost at once very successful while settlers coming from the New England States had to go, more or less, through a school of experience, which, in some cases, delayed final success for a few years.

Foreigners, especially Germans, Swedes, Bohemians, and German Russians, have been, as a rule, very prosperous. Only where strong religious ties were at the bottom of colonization schemes have the latter been unsuccessful. There are many such settlements including, among others, German-Catholic, German-Lutheran, Swedish-Lutheran, Irish-Catholic, Holland-Reformed, German-Russian-Reformed, German-Russian-Mennonite, Prussian-Mennonite, Bohemian and Polish Catholic colonies, some of considerable magnitude.

When this railroad company had a large amount of land of its own to sell we maintained an agency at the New York port; also at one time in Liverpool, and we scattered literature abroad in almost every European tongue; but that time has long since passed, and the class of foreign immigrants of late years arriving at our Eastern seaports would not present a profitable field for this kind of work, even if we had the land to sell. We prefer at this date to get our immigration from among the renters or other people who want cheaper land from the States of Iowa, Illinois, Indiana, Wisconsin, Michigan, Ohio, Pennsylvania, or the New England States, in other words, people from the same latitude in the States east of us, and the less the distance they have to move the more likely will they be to understand and adapt themselves to the conditions they find.

Yours, truly,

C. J. ERNST,
Assistant Land Commissioner.

The sugar-beet industry in this State is opening up opportunities for immigrants. One large corporation is making especial efforts to bring to its farm laborers either

from rural districts or from cities. This corporation is especially desirous of securing large families. Following are descriptions of their methods, etc.:

We are making a strong effort to bring on to this farm laborers either from rural districts or from cities. We are continually bringing people from cities in this State—for instance, Omaha, Lincoln, and other points—to our farm.

Our principal enterprise is the making of sugar from beets at the factory of the — Beet Sugar Company, established 2 years ago. The — Cattle Company has maintained a farm for 15 years at this point. Our success in developing an elaborate agricultural enterprise depends, in my opinion, largely upon our ability to collect these people, and especially those having large families, and giving them profitable employment. I inclose copy of contract which we make with them, which promises to work successfully. It is my plan to give them an opportunity to buy land after they have been here for a while. Up to December 31 of last year the — Cattle Company had paid out in 14 seasons \$644,106.90 in wages to laborers. Our pay roll for the last year was \$135,773, to which is to be added the pay roll of the — Beet Sugar Company. I mention this particularly to point out the very great importance of the beet-sugar industry in the matter you are investigating. There is now, although the industry has only made a beginning, a strong and growing demand for farm laborers and tenants, and in a degree to bring factories in competition with one another to secure such labor. For instance, on one or two occasions factories in Colorado have competed strongly with factories in Nebraska for Russian labor, which centers about the city of Lincoln. The Russian labor of which I speak is that of Russian Germans—the people are Teutons, not Slavs.

As you see from a memorandum herewith, wages earned by the largest and most industrious families are very satisfactory. The best of our Russians are good laborers, but as a rule they are naturally more backward than any other, ignorant, under control of leaders, tending to be insubordinate and difficult to please. Russians also when newly arrived have no skill in the handling of animals, and it is necessary to teach them how to handle and drive teams. The best of them, however, are quite satisfactory; and as they know something of beet culture, they are a good deal sought after both in Nebraska and Colorado, and we have also sent some to a beet-growing district in Iowa.

We make so strong a point of getting men with large families that we refuse employment, as a rule, to those with small families. As in the case of farm laborers and contractors under the contract inclosed herewith, with farm tenants who rent land by the acre the opportunity in the culture of beets is the very best. We make special and particular efforts to secure such, and I base the success of beet culture in this State on tenant farmers, as farm proprietors having 160 acres of land or more, well stocked with live stock, do not willingly grow beets as a rule.

Through our large farming operations in summer and the feeding of live stock in winter we are able to provide people more continuous work and subsistence for families than would be possible under any other conditions in a rural district, even under a system of small farms operated by their owners, for the reason that feeding operations would not be on anything like so large a scale, though consisting of the aggregate operations of a very considerable number of farmers.

It was perhaps not your intention to draw out an argument in favor of beet sugar, but the answer to your questions necessarily constitutes such an argument, since the growth of the industry will absorb as farm laborers and tenants all of the classes of people you would like to provide for and as rapidly as they can be supplied; and since beet sugar must necessarily be produced by corporations having considerable financial strength, such people may be more easily, comfortably, and successfully settled in rural districts than if they were to leave the cities for employment in general agriculture.

Yours, truly,

— — — — —, General Manager.

Additional details are as follows:

(1) About 50 per cent of laborers on farm of the — Cattle Company are Americans. Other nationalities represented are: Bohemians, Germans, Russians, Scandinavians, Irish, English, and Canadians. Probably Germans are preferred.

(2) During the beet seasons, which constitute about two months in the spring and two in the fall, we are able to employ all the people we can secure, including men, women, and children. Heads of families are, of course, employed for a much longer time, as the beets are not all delivered at the factory until sometime in January; and, in addition to beets, we have a very large acreage of corn to cut, husk, etc. Besides this, our feeding operations are extensive, having fed over 30,000 sheep the past winter, in addition to some cattle and hogs. People who do not speak English may be as valuable to us as those who are conversant with the language.

(3) On our farm of 12,000 acres, in 1900, over 6,000 acres were cultivated by the — Cattle Company proper, in addition to that tenants of the company planted 625 acres of beets.

(4) During the month of June, 1900, 1,217 people were employed on our farm; this does not mean that so many people were working at one time, but the number on our pay roll. For February, the dulllest month of the year at —, we employed 204 people, which number represents very closely the steady employees and heads of families on our farm.

(5) We encourage men with large families to come here, as every working member can get employment through the beet season. While there is a short period after the crop is laid by until harvest, and again after harvest and delivery of crops, when it is difficult to give steady employment to all heads of families, you will note from a partial list of wages which I inclose herewith that during the month of October, 1900, alone, large families received an amount equal to two-thirds of the average wages per capita paid in the United States. The — Beet Sugar Company employs about 250 people during the sugar campaign, which period covers a portion of our dull season, and it is a part of our plan that the two companies may exchange labor.

(6) During a portion of the beet season in 1900 we paid \$1.40 per day, and at harvest time \$1.50. During the winter we pay \$1.25. These amounts represent wages without board.

(7) The wages paid in summer have increased.

(8) For the season of 1901 we have leased nearly 2,100 acres of land to farm tenants. Of this acreage the largest portion is leased for a given rental, but over 350 acres of beets will be grown on the shares. The company agrees to furnish land, animals, machinery, and to advance a subsistence, if necessary, for 50 per cent of the proceeds. This is designed for men with large families with limited means, as it enables such to come here and get into a paying business from the start.

(9) There are Germans, Scandinavians, Danes, Irish, and Scotch in the neighborhood as independent farmers.

Partial list of families employed by — Cattle Company in beet fields, month of October, 1900, together with amount earned.

Memorandum of agreement for growing beets.

This agreement, made this — day of —, 190—, between — Cattle Company, of —, Nebr., party of the first part, and — party of the second part, witnesseth:

1. That in consideration of one dollar (\$1) in hand paid, receipt of which is hereby acknowledged, and in consideration of agreements by the party of the second part, hereinafter specified, party of first part gives and grants to party of second part, the sum of — acres of land described as follows: — for the purpose of raising a crop of sugar beets thereon, for and during the season of 190—:
2. That also in consideration of agreements made by the second party, as hereinafter specified, said party of the first part hereby agrees to give to said second party 50 per cent, or one-half, the net proceeds of the crop of sugar beets grown on said land, said net proceeds being the sum of money paid by the — Beet Sugar Company to the — Cattle Company for the net weight of beets delivered from the land aforesaid at the price paid therefor.
3. Party of the first part further agrees to furnish to the party of the second part all horses and machinery required in the cultivation of said crop of sugar beets.
4. Party of the first part agrees to furnish all beet seed required for the said crop of sugar beets, and reserves the privilege of deciding what variety of beet seed shall be used;
5. Party of the first part agrees to furnish, without cost, manure and lime to be used in fertilization of the said land; said manure and lime to be applied to the land, without cost of labor to the said party of the first part, if applied at the option of the said party of the second part. In case said lime or manure shall be applied by the wish of the party of the first part, said first party shall have the privilege of applying the lime or manure at its own cost.
6. Party of the first part shall pay to the party of the second part 50 per cent of the proceeds as above, as compensation for all labor of every kind and description necessary for the said crop of sugar beets from the beginning: including clearing of land; plowing and preparation of the soil by harrow, or otherwise; seeding, hand work; hoeing, operation of beet millers; pulling and topping; placing in piles ready to be loaded on wagons, and assistance in loading in case of immediate delivery;
7. In case said party of the second part shall himself deliver the sugar beets at the factory, said party of the first part shall pay him for so doing at the rate of twenty-five (25) cents per net ton of beets delivered;
8. In case it is necessary to put a portion of said crop of sugar beets in silo, the said party of the first part shall pay to the said party of the second part for so doing at the rate of — cents per net tons of beets delivered;
9. The said party of the first part reserves the privilege of such direction or oversight of the labor involved in growing the above crop of sugar beets as it judges necessary, and the said party of the second part shall in such case comply with such directions and instructions;
10. In case said party of the second part proves to be incompetent or unwilling, or if for any reason, as in case of sickness, he is unable to carry out his part of the agreement, then in that case said party of the first part may, at its option, take entire charge of the growing of the sugar beets on the land mentioned above, giving to said party of the second part due compensation for the work already done, or conducting the work remaining to be done for the account of the second party, as it may be deemed best;
11. The said party of the first part hereby reserves for its own use all beet tops from beets grown on the above-mentioned land;
12. The said party of the first part hereby agrees to advance to the said party of the second part such portion of the value of the work done by the said party of the second part, up to any point of time, as may be requested by said party of the second part, it being agreed that a sufficient margin shall remain in the hands of the said party of the first part during the continuance of this contract, as guaranty that it shall be carried out in good faith by said party of the second part;
13. The said party of the second part on his part hereby agrees to perform all the labor of tillage, cultivation, and harvesting the crop of sugar beets on said land, as specified above, in a thoroughly efficient, honest, and workmanlike manner, and also agrees that his labor shall be continuous and regular, and that he will in no way whatever neglect the work required on said crop;
14. Said party of the second part also agrees that he will perform all the said labor, as above described, for 50 per cent of the net proceeds, as described above; and
15. All horses and machinery belonging to the first party in the hands of the second party must be used in the most careful manner. Any loss or damage to either horses or machinery resulting from ~~gross negligence~~ shall be charged to party of second part.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

NEMAH COUNTY.—Ninety per cent of our farmers own their farms. Tenant farming is practicable only to a limited extent. Railroad lands are cheap; payments on long time with low interest.

DOUGLAS COUNTY.—(1) Worthy tenants have good opportunities; are sought for and started. They are given two-thirds of the crop usually; often a little less. A good, industrious, honest farmer always succeeds in establishing himself as an independent farmer, and the good land all over Nebraska is rapidly falling into their hands. The saying is they will succeed where a native will starve. (2) Chances for renting farms are by this time mostly taken up. Usually tenant gets one-half to two-thirds of crop. A poor man can establish himself as an independent farmer while hiring out if he is the right man, but he had better buy land where it is cheaper than it is here.

WASHINGTON COUNTY.—Fair opportunity for renting at from \$2.75 to \$3.50 an acre cash or two-fifths of the crop. Rather poor chance for purchase, as land is worth from \$45 to \$70 an acre.

DODGE COUNTY.—Good opportunities to become a tenant farmer on reasonable terms and good opportunities for purchase.

FILMORE COUNTY.—Land rents at two-fifths of the crop. Opportunities are good to good, honest farmers. They are being sought for. Farming land is too valuable for a poor man to purchase while hiring out.

BUFFALO COUNTY.—While there is a greater demand for land than the supply, good tenant farmers are scarce and are desired. The terms are usually one-third of the crop, or one-half if seed is furnished. Good opportunities for purchase for the right kind of men. A considerable number of our people are foreigners who came here without means and have established themselves as independent farmers.

PHILLIPS COUNTY.—Many farms to let; usually for a share of the crop. There are no free lands, but 30 to 60 miles further west good land can be bought on almost any terms at \$5 to \$10 an acre.

KEITH COUNTY.—Good opportunities for tenant farming. Plenty of land can be leased and can be bought on easy terms.

SOUTHERN STATES.

GENERALLY.

The South Atlantic and South Central States may best be treated as one large group, offering, as they do, certain problems common to each group, and distinctly marked off from those presented by other grand divisions.

The common problems are those arising from the enforced change of agriculture from a system based upon slave labor to one based upon free labor, and are working themselves out through (1) a decline of old kinds of farming; (2) a growth of manufacturing interests; (3) a beginning of new forms of agriculture and of demand for farmers and farm laborers especially fitted to carry these on.

The older form of Southern farming—extensive cultivation of great staple crops, such as cotton, rice, and tobacco, by the aid of cheap labor—is generally regarded as becoming less and less profitable. Extensive cultivation has wasted and exhausted the land. Market conditions for the crops grown are considered generally unsatisfactory. The change from slave to free labor brought about changes in agriculture, the full nature and extent of which are not as yet fully to be traced, but which are, necessarily, more or less serious.

Considerable testimony is brought forward to show that negro labor has deteriorated since the war. The younger generation are said to be roaming off to towns and cities; those who remain are not so faithful and efficient as those of the older generation.

The negro as a farm laborer is generally considered to be at his best in cotton farming. But even here he gives much ground for complaint. A Southern farmer stated before the Industrial Commission:

I think one of the causes of the depression in agriculture in the South is the presence of the negro. The negro does not know how to use improved implements, and does not want to know how, and it is almost impossible to teach him. If a man farming cotton on an extensive scale puts an improved implement in use, every dandy says it is impossible to use it, and they do not.

Furthermore, certain peculiarities of his have given occasion for, and even made necessary, methods of employing labor that are serious drawbacks to agriculture in general.

These methods, especially characteristic of Southern agriculture, are renting, "cropping," and a wage system, in which payment is made by the day rather than by the week or month, and to a considerable extent in provisions instead of money; and all find a support in one idiosyncrasy of the negro—his objection to fixed tasks, close supervision, and continuous labor. Customs vary in detail in different parts of the country, but in general the renting and cropping systems may be described and distinguished as follows:

In "cropping" the landowner furnishes land, team, and tools; the "cropper" furnishes labor. The landowner also furnishes the cropper such supplies as he may want for his family during the year, commonly from a "plantation store," charging usually a price higher than the cash market price. The "cropper" makes the crop, with the aid of his wife's labor and that of his children, and in the fall, when the crop is gathered, the landlord markets it, and the proceeds are divided, the landlord subtracting from the cropper's share sufficient to liquidate his store debt. The landlord is secured for his advance supplies and for his share of the crop by a "crop lien," the terms of which differ in different States. Under the cropping system the landlord usually has some oversight of the "cropper" and his methods.

Renting may be either for a crop or money rent. The crop rent seems to be the one most usually arranged for at present. The chief difference between this and the cropping system seems to be that the renter is on a more independent footing than the "cropper." The renter is, practically, an independent farmer himself, raising his crops as he chooses, marketing them himself, and simply paying to the landlord a stipulated amount of product or of money as the rent of land and house.

The tenant or share system, as a whole, by which transactions between laborer and employer are carried on as far as possible in terms of commodities—shares of crops, goods and supplies from the store bought and sold on credit, tools, teams, etc.—rather than on a cash basis, was originally due, no doubt, to other conditions binding the landlord than the preference of his laborers. The landlord had no ready money to pay laborers; he was himself dependent upon credit given by merchants and cotton factors on the basis of the expected crop. Uncertain, besides, as to the price to be realized for the harvested crop, and working upon the narrowest possible margin of expected profit, the landlord could not even make a bargain with his laborers in cash terms. He was obliged to share with them the chances of the market.

The continuance of the system is, however, claimed by the planters to be largely due to the characteristics of the negro laborer. The white farmer is extricating himself to a considerable extent from the credit system, so far as the marketing of his crop is concerned, and is more and more able to pay cash wages to laborers. The tenant system, however, meets the negro laborer's desire for freedom in regulating his work and his working hours more completely than the wage system, and it is the one still most largely in use. A representative Southern farmer testified before the Industrial Commission¹ that while he regarded the tenant plan as "iniquitous," he followed it because he "could not get the labor to work otherwise." The labor thus employed works only about 7 months in the year. The rest of the time is devoted to loafing, fishing, hunting, etc. It seems to be generally agreed that the tenant method is bad for the land. One farmer states: "This ruinous system has done more to impoverish and retard the progress of our farmers than any other combination of circumstances." The renter or cropper takes little pains to keep up repairs or fertility and the land rapidly deteriorates.² For instance, the washing away of certain needed elements by rainstorms, freshets, and so forth, may be prevented by terracing up the land; but this the average tenant will not trouble himself to do.³ Nor will the landowner trouble himself so long as he gets some sort of an income from the land through the rent payable by tenants.

As between renting and "cropping," the latter system is apparently better for the land, as the landlord has some oversight of cultivation; but the tenant prefers the former system because he is freer from restraint, and in many cases the landlord falls in with this desire, to save himself trouble and to get his land tilled at all, labor, under present conditions, being so floating and temporary in its character.

It was said before the Industrial Commission⁴ that the disposition to rent land at

¹ Report of Ind. Com., vol. x, p. —; testimony of Mr. J. E. Nunnally, Nunnally, Ga.

² *Ibid.*, p. 456.

³ *Ibid.*, p. 504.

⁴ *Ibid.*, p. 456.

⁵ Reports of Ind. Com., vol. x, p. 486.

so much per acre, instead of on the old cropping system, was likely to prove very injurious to the country.

The tendency is to get rid of the management of the labor, to furnish them cheap stock and cheap utensils, to improve as little for them as possible, and get rid of the worry. The white people as a result will move into the little villages and stations, and it seems to me it will be only a few years until the larger part of the upland section of the country " " " will be occupied by negroes. The lands, of course, under their management as tenants, will wash away and wear out, fences go down, improvements become dilapidated.

This system has its disadvantages for the tenants also. It is generally considered that where the negro is left to himself, in communities solely of his own kind, progress ceases, and even positive deterioration, social and moral, sets in. This is recognized by the progressive negroes themselves, as well as by the whites.

Southern farmers are discouraged with cotton farming under all the conditions above outlined. Labor, although cheap from a money point of view and plenty, is not cheap enough with regard to efficiency and the price of the crop. An instance given before the Industrial Commission illustrates this. A South Carolina farmer and merchant states¹ that when he hired labor by the day he paid 30 cents, one-fourth in cash and three-fourths to be traded out at 50 per cent profit, equalling 19 cents a day actual outlay, "and yet, raising the crops as cheaply as that, the proceeds will not meet the expense of raising."

This farmer, it should be noted, had no complaint to make of the efficiency of the labor employed, and others agree with him in considering the negro a satisfactory cotton laborer. But, however this may be, whether the farmer attributes his failure to labor, to the banks, to the markets, or to the railway companies, the fact remains that cotton farming is generally found unsatisfactory and the farmers are looking about for some means of improvement.

A remedy more and more looked to in all parts of the country is diversified or intensive farming. For this sort of farming the general opinion seems to be that the negro laborer is not suitable. Testimony as to his capability is not all one way, it is true. A prominent and successful fruit grower, testifying before the Industrial Commission,² speaks highly of the efficiency, adaptability, and faithfulness of the negro laborer in fruit culture, including such parts of it as require special skill and care.

Others say, however, that the negro can raise cotton and nothing else; that he can not be trusted to care for stock; that he is unable to use farm machinery (as has been noted); that he will not give the care and attention necessary for diversified and intensive farming. It is said that the negro renter will not even cultivate his own garden patch to any great result in providing supplies for his family.

The prevalence of negro labor is, indeed, on the one hand an incentive to go into diversified farming as a relief from the cotton farming, which depends on this inefficient class of labor;³ and on the other, one of the greatest drawbacks to making the needed change. One farmer testifies⁴ "the labor that we have there must be worked some way, and cotton is about the only thing they know how to make."

But, notwithstanding these drawbacks, diversified and intensive farming will undoubtedly gain ground in the South, surely if slowly, the need and advantage are so obvious.

Careful methods of culture will restore fertility to the exhausted soil, the use of improved machinery will reduce the labor cost of crops, diversification of products will supply the wants of the home plantation to greater advantage than purchasing everything with cotton. Supplemented by diversified farming, cotton farming itself is more likely to prosper.

The farmer who is no longer absolutely dependent on the one great crop can cultivate it to better advantage, and by a system of economy and use of hitherto neglected resources, diversified farming need not at all diminish the acreage given to cotton, but may even allow of its increase.

It may be of interest to note the estimated acreage of cotton planted in the last 2 years.

¹ Reports of Ind. Com., vol. x, p. 117.

² Ibid., p. 382 et al.

³ A representative farmer writes: "The 'new era' negro from 18 to 30 has become so perfectly unreliable as a field hand that diversified farming is largely forced on the planters."

⁴ Reports of Ind. Com., vol. x, p. 76.)

¹ Crop Reporter, June, 1901 (vol. 3, No. 2).

This presents a general increase for the past year of over 8 per cent, and is due mainly, it may be assumed, to the rise in price of cotton in the markets. It is plain, however, that diversified and intensive farming and the growth of manufactures, so far as they have gone, are not at least restricting the acreage given to cotton.

As an independent industry, too, diversified farming will gain ground. The growth of manufacturing industries in the South is opening a wider and wider home market for dairy, garden, and orchard products, while the North is daily extending its demands for the same commodities, and railroad facilities are bringing these markets nearer to the Southern farms.

All the circumstances above outlined seem especially favorable to the introduction of European farmers and farm laborers with their knowledge of intensive methods and diversified farming into a country that has hitherto known little about them, and that is generally regarded as well—too well—supplied with both farmers and laborers.

As a result of the change going on in the agricultural system much land in the South has fallen altogether out of cultivation.¹ It is "worn out" in the sense that the surface fertility is exhausted, but under intensive methods it is capable of restoration and high cultivation. Other lands now cultivated in large tracts on the extensive system may be broken up into small tracts for cultivation intensively, and will thus sustain a greater population.

Still other lands, held by small farmers, who are at once farmers and laborers, have been left open to settlement by the departure of their owners for the cotton mills, which, employing only white labor, are now drawing heavily upon the small landholding population of the South.

In the cultivation of these lands is a most favorable opening for the foreign farmer, with his traditions of industry and skill in intensive farming. There is in the South, moreover, not only old land to be restored and made profitable by intensive cultivation, but new land yet to be opened up. Texas and Florida are as sparsely settled as the newest States of the Northwest; Louisiana and Arkansas afford thousands of acres of unimproved land to be worked; in Mississippi great tracts of land recently cleared or not yet cleared of timber are ready for the settler.

There has been for some time a decided call for a class of foreign immigrants with capital enough to make initial payments on land and set up as independent farmers. State boards of immigration and private corporations have been, and are now, engaged in trying to attract settlers of this class. There is little express demand for foreigners as farm laborers in comparison. It is as yet generally felt that the negro laborer holds the field, and that the foreign immigrant can not compete with him. But the same qualities that make the foreigner desirable as a farmer make him desirable as a laborer—his industry, his continuous application to his work, his intelligence, and skill. The growing dissatisfaction with the negro laborer is already taking shape in some calls for foreign laborers. (See tables.) Where foreign farmers have settled it is natural to suppose that foreign laborers will find a place, in some cases as a stepping-stone to farming on their own account. Little by little

¹ E. g., Virginia, Maryland, Georgia, Reports of Ind. Com., Vol. X, pp. 104, 109.

farmers will recognize that the cost of labor is not measured by the money paid out for it; and there seems every probability that, under the new system of farming coming in, the foreign farm laborer can compete successfully with the negro in respect to real, as contrasted with nominal, labor cost.

DELAWARE.

(See table, p. 614.)

Representative farmers from the three counties of Delaware report favorably, with one exception, as to opportunities in the State for newly arrived immigrants who do not speak English. Fruit, dairy, and truck farming give employment throughout the year to a large proportion of the farm laborers employed. Married laborers are employed and sometimes preferred, and there is considerable work for women and children. Farm laborers are principally negroes, but there are also Irish, Germans, Swedes, and Poles. In two cases a preference is expressed for Germans and Poles as farm laborers. One farmer says that negroes are employed, but Germans and Swedes would be preferred if they could be had. Germans, English, and Canadians are established as independent farmers in the State. Many of the Germans began as farm laborers. One farmer states that there are no foreign farmers in his neighborhood, but "would like to have them." Another in the same county says, "Our people are very friendly to Germans. They make good 'help' and good citizens. There is a good opening for such people."

As to general conditions, one farmer writes as follows:

I recognize that our wages are much lower than in some sections, but we have advantages in cheaper living for families, and opportunities for women and children to pick berries and other fruits, that largely help to make up the deficiency. I am a landowner and farmer by proxy, living in town and renting the land. I own four farms, which I have made and paid for out of the business of farming and fruit growing. So I think I am in a position to know what has been done, and I do believe there is an opening here for small farmers who are industrious and frugal. I have not a foot of land to sell, so I am not advertising. There is a great call here for house girls at about \$2 per week.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

SUSSEX COUNTY.—Very good opportunities for renting, tenant paying share of the crop according to condition of the land. Good opportunities for purchase.

KENT COUNTY.—(1) Terms for renting, half share of the product or a cash rent. Industrious, reliable men can get farms to rent. There are the best opportunities for purchase while the purchaser is hiring out. (2) A large part of the land is worked on the tenant system, always on shares. Tenant does all the work, furnishes a small portion of the fertilizer, and gets half the crop. Land is low in price and easily improved. Many native farm laborers now own their own farms, and are doing well—both white and colored. (3) Good opportunities for renting. Tenant gets all proceeds of poultry and stock and divides grain and fruit. He stocks the farm. As to purchasing while hiring out, this is continually occurring. A man has only to prove his ability and character.

NEWCASTLE COUNTY.—(1) Most of our tenant farmers began as farm hands. (2) The average foreign farm laborer does not seem to wish to become a farmer. Nearly all say when they make \$500 they will go back to their own country. There is little chance for purchase in this particular neighborhood.

MARYLAND.

(See table, p. 616.)

In this State a considerable proportion of the agricultural land fell entirely out of cultivation as a result of the change from slave to free labor. Such abandoned lands, in general, are said to be good agricultural lands, abandoned only on account of the difficulty in getting labor to work them properly.

In 1886 the State established a bureau of immigration to call attention to the resources of the State and the advantages offered to settlers, and to assist in the sale of lands. Dutch and German settlers, either direct from the old country or from the Western States, were especially desired as thrifty, industrious farmers, who would be particularly successful in reclaiming marshes and swamps, clearing away land grown up to timber, and improving land that had lost its fertility.

Pamphlets giving full information about the State and its resources were prepared, and an agent sent out to the Western States, to Holland, and to Germany to lecture on those topics. It was claimed that a farmer in Maryland could, on a farm of 40 to 60

acres, make a better and more comfortable living than in the Western and North-western States on a 200-acre farm, and that the man who possessed a few thousands of dollars to pay for a farm, cash down, in Maryland, was at once assured of a good future, while a good start could be made with from \$400 to \$800.

As a result of this activity many families of Germans, Dutch, and Swedes have settled in the State. A German settlement has been established near Preston, in Caroline County. During the autumn of 1898 about 25 families from various places settled throughout the State, mainly in Baltimore, Harford, and Frederick counties, and some on the Eastern Shore. In the spring of 1898 the beginning of a Dutch colony was made at Denton, Caroline County. Within recent years a considerable amount of land was purchased by Germans in Dorchester County. Up to November, 1899, it was estimated that between 400 and 500 families of desirable immigrants had settled in the State and had bought more than 25,000 acres of land.¹

One obstacle to the work was the difficulty of procuring sufficient land in single tracts, as foreign immigrants preferred to settle in colonies. A tract of 12,000 acres was finally procured in Somerset County, with the idea of making it a Dutch settlement. The Maryland Land and Immigration Company of Baltimore now hold about 3,000 acres of land in this county, as yet unsold, and are planning to settle Dutch families there. About 15 families are already established and doing well. All kinds of crops are grown on these lands, and transportation facilities are good. The prices are from \$8 to \$25 per acre. The settlers referred to have come mostly from the Western States, and agents are still at work in those States trying to induce immigration. The conditions in Somerset County are considered especially favorable for the Dutch, being so much like those prevailing in Holland. A committee of three farmers from the Dutch colonies of the West, having been sent on to examine and report upon the Maryland lands, declare formally that "According to our best conviction the said lands are especially adapted for a Holland colony," adding naively: "It appears to us that these lands are designed by God for our Holland people."

Certain parts of the State appear to offer especial inducements for the better class of Hungarian settlers. An instance is given by the secretary of the bureau of one Hungarian purchaser who bought 400 acres of land in Anne Arundel County for the purpose of raising Tokay grapes, considering that the conditions of climate and soil afforded a remarkable parallel to those in Hungary. Success in this one undertaking probably means the beginning of a Hungarian colony and the development of a new and profitable form of agricultural industry in the country.

For the 12 months ending April 30, 1901, the State board of immigration reports that 249 immigrants came to the State and altogether purchased 4,577 acres of land. Of these immigrants 96 were from other States or Canada, 74 from Germany, 12 from the Netherlands, 23 from Switzerland, 41 from Austria-Hungary, 1 from Denmark, and 2 from South Africa. Descriptive literature and maps had been distributed through shipping and transportation agencies and by advertising in the leading agricultural papers of the Northwestern States and in Europe. Especial efforts appear to have been made to induce immigration from Germany. Of 1,847 pamphlets and maps sent out 1,047 were sent to Germany, as against 284 throughout the other States and Canada, 136 to the Netherlands, 154 to Switzerland, 137 to Austria-Hungary, and less than 25 to any other one country.

The State bureau offers to give to anybody wishing it information as to situation and quality of soil of lands offered for sale in the State or concerning the resources at the command of immigrants, industrial opportunities, routes of travel, etc.

The pamphlet of information issued by the bureau makes the following statement:

The bureau is not connected with any steam navigation company or real-estate syndicate. It is not interested in and does not receive any commission from the sale of land or perform any services in a business line for immigrants; all it is intended for is to furnish information, and thus it does gratuitously. It will protect immigrants from imposition by land agents, if such should be attempted. Its office is a public one, and its officials are State officers, but ready to guide and help all intending settlers by furnishing them names of persons or concerns to whom the immigrant safely can apply.

The master of the State grange speaks well of the German farmers who have come into the State.² Many, he says, who came as laborers in a few years acquired land of their own, and are now prospering. They were experienced in farming before coming here. Many have settled near the cities and are engaged in truck farming, which requires less capital than some other kinds of farming and is profitable. In his opinion, the incoming of German farmers has been to the improvement of agricultural conditions. They have set a good example of industry and economy, and some are among the best citizens of the State. As farm laborers they are more effective than either the negroes or the class of native whites obtainable in the State.

¹ Second Report, State Bureau of Immigration, Baltimore, 1899.

² Testimony of Mr. Joseph B. Ager, Reports of Ind. Com., Vol. X, p. 103 (1899).

Reports received from representative farmers (see table, p.—) were from three counties only—two on the Eastern Shore and one in the northwest corner; so they can be taken only as showing conditions in these particular sections.

From the Eastern Shore counties one farmer reports no foreigners as farmers or farm laborers and no opportunity for immigrants. The other speaks of Irish and German farmers and laborers in the neighborhood, and makes note of a colony of Germans brought there in 1870. These people found it hard to learn American ways and the language, he says, and soon left.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

QUEEN ANNE COUNTY.—Land rents here for half of the produce raised. The owner furnishes one-half phosphates, one-half seed wheat, and draws half. Farm lands sell here from \$10 to \$75 an acre, according to quality and location. To purchase you are required to pay down one-third and give a mortgage at 6 per cent for the balance. The mortgage may usually run as long as the interest is paid.

TALBOT COUNTY.—There are no chances for renting farms. We now have more tenants than there are farms. It is possible for a poor man to establish himself in independent farming while hiring out, but not for the kind of help we are accustomed to.

WASHINGTON COUNTY.—The proportion of tenants to the farms is large. The outfit of a tenant costs from \$1,200 to \$3,000, and he gets one-half the gross proceeds of the land, paying for one-half of the fertilizer and one-half the seed. It is not practicable for a man to purchase land while hiring out.

VIRGINIA.

(See table, p. 617.)

In 1894, according to the commissioner of agriculture,¹ Virginia desired immigrants able to buy homes, large or small. These were wanted mostly in Southside and Tidewater Virginia, and lands were lower priced in these sections; but the whole State desired an influx of population. English, Scotch, Irish, Germans, and Swedes were the nationalities desired or preferred.

The desire for immigrants still exists. The commissioner of agriculture writes as follows under date of December 17, 1900:

There are fine opportunities for immigrants in this State; greater than heretofore. Owing to the location and climate of this State, intensive farming is becoming very profitable, also stock raising; and there is more demand for labor in all lines of industry.

We have not had enough immigrants to see much difference between the nationalities. The Germans have so far, I believe, made the best class of farmers.

Foreign farmers have been successful, owing to their training in intensive methods of cultivation. Farmers gladly welcome all immigrants who are industrious and law-abiding citizens. There is a wide field and splendid opportunity here for them.

The State has made no effort to secure immigration. The railroads, however, are encouraging them, and also the real-estate agents.

G. W. KOINER, *Commissioner*.

Letters from representative farmers were received from the Blue Ridge region only. Speaking for this locality, 5 of the 8 farmers heard from gave no encouragement as to opening for non-English speaking immigrants. This part of the country is by no means thickly settled, has few large towns, laborers are practically all employed through the year, and there is considerable work for women and children. But almost no foreigners have penetrated to this region. Some Germans and English are noted in Albemarle County, who have done well. One correspondent writes that foreigners would be welcomed as purchasers of land. Farm laborers are exclusively native whites and negroes. Farmers express preference for one or the other of these classes, as they know nothing about foreign labor. Some dissatisfaction with negro labor is expressed. In one case a farmer says Germans would probably suit better. With regard to other parts of the country, Signor Mastro-Valerio notes² that Italians are found in the large truck-farming districts near Norfolk.

¹ Report of Immigration Investigating Commission, p. 150.

² See p. — of this report.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

FRANKLIN COUNTY.—Tenancy on terms of half crop of tobacco and corn and one-third of wheat and oats; owner furnishes teams, tools etc.; tenant finds himself. An industrious, frugal man could buy a little home and pay for it by hiring out or by close work on his farm.

BOTETOURT COUNTY.—A great many farms are rented here (stocked.) Give one-third. Good opportunities for purchase while hiring out.

ROCKBRIDGE COUNTY.—Few opportunities, as renting is not looked upon with favor. A poor man can establish himself in independent farming while hiring out. "The man that is now working for me has done so."

AMHERST COUNTY.—Good parties can become tenant farmers. Can farm on shares, the landowner to furnish land and team and give the renter one-fourth. A poor man can establish himself in independent farming while hiring out. This is being done by many of our laborers.

ALBEMARLE COUNTY.—No answer given.

AUGUSTA COUNTY.—We now have more native tenants than farms. Not a very good chance for a poor man to become an independent farmer while hiring out, though an exceptionally industrious man, a good manager, might succeed.

ALLEGHANY COUNTY.—Good opportunities for renting. Tenant or landlord furnishing teams and seeds gets two-thirds of crop. A man who purchases land on payments will find all of his time needed to cultivate it; but he will have good opportunities to hire out.

WEST VIRGINIA.

(See table, p. 618.)

The table for the State gives reports from representative farmers in (1) the southern part of the State, on the Virginia side, (2) on the Ohio border, (3) in the north-eastern part of the State, and (4) in the "Panhandle." The table is not, then, fairly representative of conditions in the State as a whole. In all of the counties heard from but Brooke, the Panhandle county, there are almost no foreign farmers or farm laborers; no desire is expressed for their incoming, and there are said to be no opportunities for non-English speaking immigrants.

Testimony given before the Industrial Commission! as to conditions in the extreme northeastern part of the State (the eastern Panhandle) is to about the same effect as that for the above counties.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

MONROE COUNTY.—Not much demand for tenant farmers. They usually get half the produce and are sometimes required to furnish teams. The opportunities for purchase are poor.

RALEIGH COUNTY.—No opportunities for renting, but very good for purchase.

GREENBRIER COUNTY.—Good opportunities for renting either on shares or by lease for a term of years for clearing the land.

PUTNAM COUNTY.—(1) Good land may be rented on halves, the renter furnishing everything but the land and permanent repairs. There is not much chance for a poor man to purchase while hiring out. When he could hire out he would be needed to work his own crops. (2) Not much tenant farming is done here, and there is not much opportunity for purchase on especially easy terms except on the hills and ridges.

MASON COUNTY.—No opportunities for tenancy or for purchase on easy terms.

BARBOUR COUNTY.—There are good opportunities for tenancy; not so good for purchase. Land is high here.

BROOKE COUNTY.—There are good opportunities for renting; not so good for purchase. Land is high.

¹ Reports of Ind. Com., Vol. X., p. 591.

NORTH CAROLINA.

(See table, p. 619.)

The assistant commissioner of agriculture for the State, in reply to a letter of inquiry addressed to him regarding immigration and general agricultural conditions, writes as follows under date of December 29, 1900:

Replying to your inquiries of the 14th instant, I beg to say that there has been but little foreign immigration in North Carolina—not enough to have any perceptible effect upon wages and employment.

Relative to your questions I answer as follows:

First. Are there opportunities in your State for immigrants greater than there have been during the recent years of industrial depression? If so, in what occupation?—Answer. Yes, within the past 10 years more than 50,000 negro farm laborers have emigrated from the State—the bulk of them going to the cotton fields of Mississippi and Louisiana. The numerous cotton mills and other manufacturing which have recently been erected in North Carolina have secured their laborers mostly from the farms. These causes having almost depleted very many good farms of their laborers, have thrown them upon the market at prices below their real value, hence there are opportunities for foreign farmers of small means to purchase very fine lands at low prices. There is also a better demand for foreign laborers to work in the cotton and trucking fields.

Second. What races or nationalities are most effective as farmers or farm laborers?—Answer. The native population.

Third. Is the success of foreign farmers as great as or greater than that of American born? If it is greater, is this owing to more intensive methods of cultivation?—Answer. There are not sufficient numbers of foreign farmers to make any general comparison. At Valdese, in Burke County, N. C., there is a colony of some 40 families of Waldensian farmers, whose success in farming is greater than their American neighbors, and much of their success is owing to more intensive methods of cultivation.

Fourth. Do farmers as a class oppose or favor the further influx of foreigners in your State?—Answer. Our farmers, as a class, are opposed to pauper immigrants, but welcome farmers who come to buy homes.

Fifth. Are efforts being made in your State either by public authorities or by private parties or corporations, to attract immigrants?—Answer. Yes, the North Carolina department of agriculture is charged by the legislature with the work of immigration.

Sixth. Please inform me of any agricultural "colonies" or "settlements" of foreigners in your State.—Answer. There is a German settlement of farmers—some 200 people—near Ridgeway, N. C., and a Waldensian settlement—some 50 families—at Valdese, N. C.

Yours, very truly,

JNO. W. THOMPSON, Assistant Commissioner.

The German colony at Ridgeway above referred to consists of about 25 persons, brought to its place of settlement direct from Germany about 17 years ago by a German preacher of Brooklyn, N. Y. Most of the colonists are successful in farming, and own their own land in farms of 50, 90, 100, 200, and 300 acres. One family owns a farm of 800 acres. They are engaged in general farming, like other farmers around them, but keep somewhat more stock.

The Waldensian colony is composed of about 40 families from the Italian Alps, province of Turin, and was established 7 years ago. Few families have come in since that time. The colony is prospering. Wheat, corn, and grapes are raised. Two small hosiery mills are about to begin work, and this will be a great help to the place. The present population of the colony is about 250. This colony has become quite widely known for its success, as an instance of what a European farm colony can accomplish.

The immigration work of the State department of agriculture, referred to in the assistant commissioner's letter, was taken up in 1899 under the act of assembly reorganizing the department, which provided that among the duties of the department should be "the inducement of capital and immigration by the dissemination of information relative to the advantages of soil and climate and to the natural resources and industrial opportunities offered in the State; by keeping a land registry, and the publication of descriptions of agricultural, mineral, and forest and trucking lands which may be offered the department for sale," etc.

This work has been carried on as far as the means of the board will allow and the demands of the department seemed to require.

As to the class of immigrants wished for, it is stated in the Annual Report of the Board of Agriculture for 1899-1900, page 12.

The effort of the board, through the assistant commissioner, has been to introduce only such immigration as is desirable in the State, men of means sufficient to enable them to make investments and build homes, no encouragement being given to undesirable steerage immigrants or other undesirable foreigners.

The assistant commissioner, regarding the small German farmers as a highly desirable class of immigrants, attempted to divert some of them from their destination, the Northwest, but was unable to do so because of the fact that "they invariably locate in the State to which they start when they leave the old country."

¹Reports of Ind. Com., Vol. X, p. 335 (Mr. J. F. Crowell); Report North Carolina Board of Agriculture, 1899-1900, p. 90.

²Report Dept. of Agriculture, 1899-1900, p. 86.

To reach them in their homes and induce them to make North Carolina the State of their original choice a book of 130 pages in the German language was issued and distributed by the aid of the American consuls throughout Germany, Austria, and Belgium, and also at the Paris Exposition. This resulted in many inquiries and some immigration. One settler who came over is himself now organizing a German-American Land Company with, it is claimed, ample capital. This company will advertise North Carolina's resources, and will have its agents in Germany and Austria to distribute its literature and send farmers of means direct to the State.¹

The secretary of the State department of agriculture writes in further detail as follows with regard to opportunities for immigrants:

(1) An immigrant may succeed in North Carolina with a very limited capital, provided he is industrious and capable. Our people who have lands to sell are content with a small cash payment and annual payments thereafter from the right people. So that a man with \$250 to \$500 could get a small farm, making an initial payment of from \$100 to \$200 and time for the rest, using his surplus to maintain himself while his crops are maturing.

(2) The class of farming which may be done in this State is very varied. In the eastern part of the State, with from 25 to 50 acres, an immigrant could make a good living, because there he can grow for the early markets spinach, kale, cabbage, green peas, lettuce, asparagus, onions, beets, string beans, strawberries, dewberries, raspberries, blackberries, cantaloupe, etc. The shipments from this State aggregate 550 train loads per annum from the region described. The strawberry crop alone last year aggregated more than 9,000 tons. In the middle section of the State tobacco and cotton culture together with general farming are the leading industries. In the Piedmont and western or mountain region the cereals, grasses, and winter fruit—apples—are the leading industries. The conditions in the State, both climatic and soil, are extremely favorable for all agricultural and horticultural pursuits, and workers from any part of Europe are generally successful here.

(3) The nationalities sought by North Carolina are the English, Scotch, Germans, and Scandinavians. These more readily assimilate with our people.

(4) Unfortunately we have no facilities for furnishing transportation or even excursion rates for viewing lands; however, both the Seaboard Air Line and Southern Railway systems, two of the largest in the State, conduct land agencies, and furnish those who endeavor to locate along their lines with reduced fares or perhaps free transportation.

(5) This department—the department of agriculture, immigration, and statistics—is authorized by law to keep a land registry wherein are entered all of the lands offered the department for sale. This plan offers the immigrant his lands without commission or the intervention of other agents. The department places the inquirer in communication with the person or persons registering the lands for sale. The size of the tract and its general condition, together with the price, is registered with the department for the inspection of any investor.

(6) In regard to markets we say that this State is most favorably situated, as it is within 18 hours of New York and has excellent facilities for transporting truck and fruits from the trucking fields of the East to the Northern markets. The local markets consume the cotton, tobacco, wheat, corn, oats, etc., while the South Atlantic States afford ample market for the winter cabbage, buckwheat, and apples of the mountain region.

The State has made but small effort to secure foreign immigrants. It has, however, quite an influx from the colder portions of our own country, and these are generally preferred. Many farmers who find the New England, Northern, and Northwestern States almost too cold, and who desire a milder climate, not only for themselves, but to give an open range for 9 or 10 months in the year, and at the same time one not hot enough to be enervating, will find in North Carolina the happy medium.

Very truly, yours,

T. K. BRUNER, *Secretary*.

Curiously enough, while the State bureau is making these especial efforts to induce immigration, representative farmers heard from (see table, p. 619) are almost unanimous in saying that there are no opportunities in their localities for non-English-speaking immigrants. It is to be noted at the same time, however, that, according to the table, there are as yet almost no foreign farmers or foreign farm laborers in the State and it might be thought there were no opportunities for such people simply through lack of experience with them and their capabilities.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

GRAVEN COUNTY.—Many of the larger farmers and landowners at a distance of 10 to 20 miles from town, where negro labor is scarce (the negroes all want to live in or near towns), are anxious to get tenants, and offer liberal terms that will satisfy any tenant. There are very good opportunities for purchase on easy terms a little distance from towns.

BEAUFORT COUNTY.—Tenant farmers are greatly desired. The opportunities for them are good, if they are of any account. Poor men, if industrious and thrifty, can in a few years buy and pay for a farm of 50 or 100 acres; hundreds have done so all over eastern North Carolina.

PITT COUNTY.—In renting farms the landlord furnishes land, team, farming implements, and feed for the team; the tenant does all the labor and receives half the product. There are first-rate opportunities for purchase to a prudent, saving tenant. Negroes generally spend all they make, be it little or much. I have a white man who has saved \$1,000 in 5 years as a tenant.

¹ Report State Board of Agriculture, 1899-1900, p. 8.

WAYNE COUNTY.—Only ordinary opportunities to become a tenant farmer; terms generally one-half of the produce, team and tools furnished. Chances very poor for purchase.

WILSON COUNTY.—Very good opportunities for tenancy. The landlord furnishes land, team, farming implements, and feed for team. The tenant furnishes labor and gets one-half of the crop. Fairly good opportunities for purchase, though there is not much land for sale.

EDGEcombe COUNTY.—Tenants who supply their own team are given half the truck. When the landlord supplies team and feed and farming implements, tenant gets one-third. Cost of fertilizer is divided. There are about the same chances for purchase here as in the greater part of our State. It is better for a poor man to work for wages, save money, and buy for cash. (2) Good men who wish to become tenants can almost always make their own terms. They can always rent for a stated amount or work on shares, the landowner furnishing land, team, and tools, and receiving half the product. There are good opportunities for purchase while the purchaser is hiring out if good economy is used. Very many are now doing this.

WAKE COUNTY.—Tenant farmers are desired. Landlord furnishes land, team, feed for team, tools, etc., and receives half the crop. Some pay one-fourth rent and find everything themselves. Opportunities for purchase are good to a smart working man. Many have bought land while hiring out. (2) Land is rented on halves. Landlord supplies stock and tools. Opportunities for purchase are good here, because land is cheap and laborers are few.

FRANKLIN COUNTY.—There are fair opportunities for renting farms. Terms, one-fourth of the crops as rental, or the same proportion in cash. There are fairly good opportunities for purchase while hiring out if the purchaser is economical and a hard worker.

ALAMANCE COUNTY.—Good opportunities for renting. Tenants furnishing their own stock receive two-thirds of the crops. The local farmers having obtained low prices for their crops for some years past, and demand for labor in mills being very strong, the farmers have gone to factories, and for this reason farms are to be had on easy terms.

BURKE COUNTY.—Conditions would be hard for a tenant farmer, as land here is poor. The opportunities for purchase are unfavorable.

SOUTH CAROLINA.

(See table, p. 621.)

Reports from representative farmers show an almost complete absence of foreign farmers in their neighborhoods. In one county, Greenville, there are mentioned French, Irish, Germans, Swiss, and English. Farm laborers are as yet almost exclusively negroes and native "poor whites," and little or no encouragement is given as to opportunities for non-English speaking immigrants.

Some dissatisfaction with negro labor is expressed, however.

Wages in this State are apparently lower than in any other Southern State, but one farmer writes: "With more efficient labor wages might be increased." Another writes that truck and dairy farming are coming into greater prominence, and that "this change will alter the demand for labor. Negroes can not carry on this sort of farming." Others report the general changes already spoken of in the general survey of agriculture in the Southern States. One says: "Factory work has made labor scarce." Another: "Men going to cotton mills increase the demand on farms." Another: "As cotton mills increase vegetables and fruit are in demand."

It appears, then, that foreign-born labor may, before long, find some opening in this State.

Some interest in the colonization of foreigners as independent farmers is expressed. One correspondent writes as follows from Hampton County:

I would say, in addition to answering your inquiries as well as I could, that this company has some 4,000 acres of very fine farming lands that they are closing the cutting of the pine timber from, for sawmilling purposes, that they would cut up into lots of 25, 50, or 100 acres and sell to a colony on easy terms. It is so situated that they would have plenty of outlet and yet be a community by themselves. The company would want a good, quiet, religious community, and would expect some cash paid in at purchase.

Will take pleasure in answering any inquiries or in showing anyone around the property, and its advantages. It is a good community.

¹Farms range from 5 to 1,000 acres, and are worth from \$5 and \$10 to \$25, on time. Improved land is over \$10. Cost of clearing and putting new land into good condition is about \$10 an acre. One hundred and sixty-five thousand of the 478,086 acres in the county are under cultivation. The remainder is in field and old field. It costs \$5 to \$15 per acre to recruit worn-out land.

To reach them in their homes and induce them to make North Carolina the State of their original choice a book of 130 pages in the German language was issued and distributed by the aid of the American consuls throughout Germany, Austria, and Belgium, and also at the Paris Exposition. This resulted in many inquiries and some immigration. One settler who came over is himself now organizing a German-American Land Company with, it is claimed, ample capital. This company will advertise North Carolina's resources, and will have its agents in Germany and Austria to distribute its literature and send farmers of means direct to the State.¹

The secretary of the State department of agriculture writes in further detail as follows with regard to opportunities for immigrants:

(1) An immigrant may succeed in North Carolina with a very limited capital, provided he is industrious and capable. Our people who have lands to sell are content with a small cash payment and annual payments thereafter from the right people. So that a man with \$250 to \$500 could get a small farm, making an initial payment of from \$100 to \$200 and time for the rest, using his surplus to maintain himself while his crops are maturing.

(2) The class of farming which may be done in this State is very varied. In the eastern part of the State, with from 25 to 50 acres, an immigrant could make a good living, because there he can grow for the early markets spinach, kale, cabbage, green peas, lettuce, asparagus, onions, beets, string beans, strawberries, dewberries, raspberries, blackberries, cantaloupe, etc. The shipments from this State aggregate 550 train loads per annum from the region described. The strawberry crop alone last year aggregated more than 9,000 tons. In the middle section of the State tobacco and cotton culture together with general farming are the leading industries. In the Piedmont and western or mountain region the cereals, grasses, and winter fruit—apples—are the leading industries. The conditions in the State, both climatic and soil, are extremely favorable for all agricultural and horticultural pursuits, and workers from any part of Europe are generally successful here.

(3) The nationalities sought by North Carolina are the English, Scotch, Germans, and Scandinavians. These more readily assimilate with our people.

(4) Unfortunately we have no facilities for furnishing transportation or even excursion rates for viewing lands; however, both the Seaboard Air Line and Southern Railway systems, two of the largest in the State, conduct land agencies, and furnish those who endeavor to locate along their lines with reduced fares or perhaps free transportation.

(5) This department—the department of agriculture, immigration, and statistics—is authorized by law to keep a land registry wherein are entered all of the lands offered the department for sale. This plan offers the immigrant his lands without commission or the intervention of other agents. The department places the inquirer in communication with the person or persons registering the lands for sale. The size of the tract and its general condition, together with the price, is registered with the department for the inspection of any investor.

(6) In regard to markets we say that this State is most favorably situated, as it is within 18 hours of New York and has excellent facilities for transporting truck and fruits from the trucking fields of the East to the Northern markets. The local markets consume the cotton, tobacco, wheat, corn, oats, etc., while the South Atlantic States afford ample market for the winter cabbage, buckwheat, and apples of the mountain region.

The State has made but small effort to secure foreign immigrants. It has, however, quite an influx from the colder portions of our own country, and these are generally preferred. Many farmers who find the New England, Northern, and Northwestern States almost too cold, and who desire a milder climate, not only for themselves, but to give an open range for 9 or 10 months in the year, and at the same time one not hot enough to be enervating, will find in North Carolina the happy medium.

Very truly, yours,

T. K. BRUNER, *Secretary*.

Curiously enough, while the State bureau is making these especial efforts to induce immigration, representative farmers heard from (see table, p. 619) are almost unanimous in saying that there are no opportunities in their localities for non-English-speaking immigrants. It is to be noted at the same time, however, that, according to the table, there are as yet almost no foreign farmers or foreign farm laborers in the State and it might be thought there were no opportunities for such people simply through lack of experience with them and their capabilities.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

GRAVEN COUNTY.—Many of the larger farmers and landowners at a distance of 10 to 20 miles from town, where negro labor is scarce (the negroes all want to live in or near towns), are anxious to get tenants, and offer liberal terms that will satisfy any tenant. There are very good opportunities for purchase on easy terms a little distance from towns.

BEAUFORT COUNTY.—Tenant farmers are greatly desired. The opportunities for them are good, if they are of any account. Poor men, if industrious and thrifty, can in a few years buy and pay for a farm of 50 or 100 acres; hundreds have done so all over eastern North Carolina.

PITT COUNTY.—In renting farms the landlord furnishes land, team, farming implements, and feed for the team; the tenant does all the labor and receives half the product. There are first-rate opportunities for purchase to a prudent, saving tenant. Negroes generally spend all they make, be it little or much. I have a white man who has saved \$1,000 in 5 years as a tenant.

¹ Report State Board of Agriculture, 1899-1900, p. 8.

The Central of Georgia Railway is carrying on some work in the way of bringing foreign settlers to this State, and also to Alabama. Their land and industrial agent writes:

While this company has no regularly employed agents for the purpose of attracting foreign immigrants to this section, yet, through our various freight and passenger representatives throughout the East and the Northwest, we encourage only the thrifty, industrious, and better element of foreign immigrants to locate in this territory; and in connection with this work we are offering lands in tracts to suit the purchasers, aggregating in all about 200,000 acres, in the territory adjacent to the lines of this company in the States of Georgia and Alabama. These lands are adapted to growing all general crops, such as cotton, corn, sugar cane, wheat, rye, and all varieties of vegetables. Fruits, such as peaches, pears, plums, grapes, strawberries, watermelons, cantaloupes, etc., are also grown in large quantities, particularly peaches. These lands vary in price from \$1 to \$100 an acre, according to location, and, as a rule, can be purchased on easy terms—from 1 to 5 years with interest.

This territory being one of the greatest agricultural sections in the South, we are particularly desirous of locating thrifty (German or Swedish immigrants, who, we have found, constitute the best farmers and dairymen. Our work in connection with foreign immigrants commences only after they have been in this country for some time. We have no agents in foreign countries to work this business.

We have no colonies of foreigners established at any point on our line. It is our experience that better results are obtained by distributing the foreign element throughout the agricultural sections rather than colonizing them at some particular point.

There are one or two colonies of Hungarians in the State, who are mainly engaged in viticulture. They were brought to the State by certain Jewish capitalists, who themselves returned to New York. There were about 100 families in all in these colonies, among whom were some Slovaks.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CHARLTON COUNTY.—Opportunities for renting and for purchase also are very good.

IRWIN COUNTY.—There is some opening for tenant farming, but the best is for settlers, as this is a comparatively new country. The opportunities are good for a man to purchase, as land can be had from \$3.50 to \$15 per acre, and good time is given to pay for it. In a few years a purchaser could be independent and make a good living. Outside work can be had to make a living outside of the cropping season.

SUMTER COUNTY.—There are good opportunities for tenants. Terms, landlord furnishes house, land, farm stock, and tools; the tenant furnishes balance and gets half of the crop. Land is frequently sold on long time, paid for on installments.

CRAWFORD COUNTY.—There is plenty of land to rent or lease at from \$1 to \$2.50 an acre. Tenant can get farms, with stock furnished, on shares. There is plenty of land to sell on partial payments on very reasonable terms. No trouble for an industrious man to get along.

WASHINGTON COUNTY.—Good opportunities for becoming a tenant farmer. Tenant can pay a certain proportion of the crop or a stipulated quantity of cotton, usually 1,000 pounds lint cotton for 40 acres cultivable land, with house, garden, and fuel free. The best opportunities for purchase.

WALTON COUNTY.—In renting the landlord furnishes everything—mules, farm horse, wagon, and land—and charges one-half of the crop. The tenant feeds and clothes himself and pays for one-half of the fertilizer used. Land can be bought for \$5 to \$10 an acre, with all the time wanted to pay for it, at 7 per cent interest, payable annually.

ELBERT COUNTY.—In renting landlord furnishes land, stock, and tools, and receives half of the produce. There are good chances for a poor man to purchase if he is thrifty. Land is cheap, and there is plenty for sale.

GWINNETT COUNTY.—Good opportunities for tenants on halves, with stock and tools furnished, or three-fourths where tenant provides for himself. Small farms can be bought on time.

CARROLL COUNTY.—Good opportunities for renting farms. Tenant receives one-half, and landlord furnishes everything, or tenant furnishes everything and receives two-thirds or three-fourths. Good opportunities for purchase to a good man.

BARTOW COUNTY.—Good opportunities to become a tenant farmer. Terms, two-thirds of the grain and three-fourths of the cotton if he furnishes stock; one-half without stock. Opportunities for purchase are not good.

FLOYD COUNTY.—Good opportunities for Americans to rent farms. Terms, one-half, with all expenses paid by landlord. Chances for purchase are fair for an industrious and frugal man.

CATOOSA COUNTY.—In renting tenant pays one-fourth of cotton and one-half of corn if he furnishes his own stock. If the landlord furnishes stock tenant pays one-half of everything. Some men buy land on time and make their living and pay for the land by farming.

FANNIN COUNTY.—Very good opportunities to become a tenant farmer. The tenant furnishes stock and tools, paying one-third of the crop. Good chances for getting work while paying for a farm at Ducktown copper mines.

HABERSHAM COUNTY.—Any sober, steady man can rent as much land as he wants, paying in cereal crops one-third or cotton one-fourth of the produce.

FLORIDA.

(See table, p. 624.)

In 1894, according to the commissioner of agriculture,¹ there was throughout all sections of the State an express desire for immigrants of good character and industrious habits. Wages for unskilled labor in cotton farming were 50 to 75 cents a day, including board. In fruit growing and truck farming on a large scale unskilled labor received from \$1 to \$1.50 per day and skilled labor from \$50 to \$60 per month. As to nationalities desired, the preference was given to English-speaking people, although it was thought that Italians would be especially useful in building railroads and canals and in mining, the Germans and French as artisans and mechanics, the Spanish in tobacco manufacture. Further: "Among the European immigrants to this country there are often practical agriculturists and horticulturists who have received instructions in these industries as handed down in their families for generations." To such the State offered great inducements.

By the present time some foreign farmers and farm laborers have found their way into this State. Italians have come in to engage in orange culture. English, Scotch, Irish, Germans, Swedes, Russians, French, and Spanish are reported as independent farmers by representative farmers of the State (see table) and English, Germans, and Swedes (in two counties) as farm laborers. In one county where native whites and negroes only are employed Germans and Swedes are asked for. One correspondent decidedly prefers negro labor, for reasons which he gives in a brief but vivid characterization of the negro laborer. He says:

The negro suits this section best because we do not have to provide houses or food for him. We pay him a stipulated price per day and he finds his own lodging and food, thus giving the housewife no trouble. He comes to work in the morning and leaves at night, sleeps under any kind of shelter, and cooks his own food. If there is no house convenient, he sleeps under a tree. He works about half of his time and is the happiest creature living.

Others are not so well satisfied with negro labor. The following letter from Columbia County shows the need, in that section at least, for some change:

Your letter of inquiry came just at the time I was seeking to get into communication with some one who could assist me in getting a class of reliable and intelligent farm laborers. I am trying to farm with negroes, on half crops, but it is exceedingly unsatisfactory; first, because they are so unreliable and shiftless, and second, because they steal more than half of the crop if given half an opportunity. Within the next 2 years I would like to have 25 families. I have the land and must import the labor if I can find the kind that can do the work of this country. As an experiment I would like to have 2 or 3 families this winter. I would not at present like to try more. I can, however, place several on terms of half croppers, and possibly as tenants. I am very glad to offer my services in any way I can serve you. Trusting that we may be benefited by getting a good class of labor and at the same time help some one into comfortable circumstances, I am,

Yours, etc.,

Another correspondent writes as follows:

West Florida is the agricultural section of the State, and is just being developed. I know of no place where a man of limited means can do better than here. We are sadly in need of good farm labor in the field and house. Sawmills and turpentine farms control the negroes to a large extent and make farm hands very hard to get. Good, intelligent immigrants that would soon learn to speak English would do well. There are a few Germans here, also Swedes, but none of the other nationalities except in the cities. If you could send a colony here that have some means, so they could buy land and make a small payment, they would do well. Wild land can be had from \$3 to \$5 per acre at present, within 6 or 12 miles from the railroad, and I think our people would lend a helping hand toward getting them located.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

POLK COUNTY.—Excellent opportunities for renting farms. Good farmers can make very satisfactory arrangements. Florida offers exceptional opportunities for the purchase of land on easy terms, as living here is very cheap and land is low.

HILLSBORO COUNTY.—There are but few tenant farmers here and the chances for them are not good. Opportunities for purchase depend upon the man. A few succeed, but not the majority.

PASCO COUNTY.—No place gives better opportunities for renting. Lands, houses, pastures, and fertilizers are furnished by the owner, and the renter gives only half

¹ Report Im. Inv. Com., pp. 131-133.

the net proceeds to the owner; or the renter furnishes team, tools, and three-quarters of the fertilizer, giving the landlord one-fourth of the crop. No country offers such wonderful inducements for purchase on easy terms while the purchaser is earning a living by hiring out.

VOLUNIA COUNTY.—A renter can get all the land he wants, in some cases with good houses, having all the land produces except the oranges, free. There are the best possible opportunities for purchase on easy terms in this country if a man is honest and upright.

PUTNAM COUNTY.—There are no opportunities for renting. Land is cheap and industrious men with small capital would do well. There are opportunities to hire out a part of the year.

ST. JOHN COUNTY.—There is very little done in the way of tenant farming. Many have purchased land by hiring out, and land is cheap.

ALACHUA COUNTY.—Good opportunities for renting. The kind of crop determines the share the tenant gets. It is probably the best way for a man to establish himself in independent farming to hire out while making payments. The opportunities are good for men that will do good work. Land can be bought low and on long time.

COLUMBIA COUNTY.—There are good opportunities to become a tenant farmer for a money rent or half the crops. Land rent is from \$1.25 to \$1.75 per acre. On half-cropping, horse, land, implements, etc., are furnished by the landlord, and the tenant does all the work, making hay and harvesting. A good man can get all the help he needs in purchasing land if he has any ability to do work and is industrious. Land is cheap and can be bought wholly on time. Living is very cheap.

MADISON COUNTY.—Good opportunities for renting and for purchase on easy terms.

GADSDEN COUNTY.—Tenants have farm and outfit furnished them. Tenant furnishes the labor only and gets half the crop. The opportunities for purchasing land on easy terms are fine for frugal negroes, but they seldom avail themselves of this opportunity. On the other hand, white men could not purchase while hiring out, as this is no country for white laborers. The two races do not work together to advantage.

JACKSON COUNTY.—Opportunities are good for renting land. The landlord furnishes everything but the tenant's board and the tenant receives half the crop; or the tenant furnishes everything and gets two-thirds. An able-bodied man with a healthy wife and growing children can take a homestead and let the family improve it while he works out to support them.

CALHOUN COUNTY.—Good opportunities for tenancy and the very best for purchase to men of energy.

WALTON COUNTY.—Good opportunities for tenancy. There is no standard figure for rental, usually one-third of the crop. There are fairly good opportunities for purchase at present, as favorable, if not more so than in any section of the country.

KENTUCKY.

(See table, p. 626.)

The curator of the geological department, writing to the Immigration Investigating Commission in 1894 said,¹ with reference to a suggestion made that some means be employed whereby immigrants should be given information as to the need or lack of need of labor in various sections of the country:

The suggestion is a good one, provided the work is done by the States, cooperating with the Federal authorities, instead of by land syndicates and colonization companies acting under the sanction, either full or qualified, of Government officials.

He said further:

Kentucky needs not artisans and mechanics so much as agriculturists, fruit growers, etc., although the first-named classes are also desired in many of the counties. Families to settle the more rugged parts of the State, especially what is known (to a large extent incorrectly) as the mountainous part, and who will come expecting to acquire permanent homes, are particularly desired. There are already colonies of Swiss, Germans, and Scandinavians planted in the State. More are wanted.

But in Kentucky there is less disposition just now to secure immigrants direct from foreign countries than from other States. It is believed, in the main, such immigration is best for this State at present, though there is ever a welcome for the better class of immigrants coming direct from foreign homes.

At that time a bureau of information and immigration (not a State office) had just been organized and the manager stated to the Immigration Investigating Commission that the State desired immigration in all parts, but had made no organized efforts to induce it beyond a geological survey, with publication of the results. The object of the bureau above named was to collect and publish information about the

¹ Report Immigration Investigating Commission, 1895, p. 136.

State for the purpose of bringing in a good class of immigrants and investors, both native and foreign. The nationalities preferred were British, Germans, Swiss, and Scandinavians. Poles, Huns, and the Latin races were not desired, except individuals who came of their own volition.

With regard to present conditions the State commissioner of agriculture writes (January 4, 1901):

First. I do not think the opportunities for immigrants are measurably greater than they were a few years ago unless it be in coal mining. The prices of this product are higher now, and I think the miners and other employees share in the advance.

Second. I think the German farmers are more effective as farm laborers and as farmers, particularly around larger cities and towns where market gardening is practiced.

Third. I think the success of foreign farmers is greater upon the whole and due to intensive methods.

Fourth. Our farmers do not oppose, but favor, the influx of the right kind of foreigners into the State.

Fifth. The Louisville and Nashville Railroad, the Illinois Central Railroad, the Southern Railroad in a general way are encouraging immigrants to settle along their lines. The Commercial Club of Louisville is endeavoring to do the same. There are also private parties and corporations who either own land or are interested in inducing immigration.

Sixth. There is a Swiss colony established at Bernstadt, Laurel County, which seems to have been very satisfactory after some 12 years' experience. The German farmers mentioned in second paragraph above mostly come as individuals and not in colonies.

Very truly, yours,

I. B. NALL, Commissioner.

The representative farmers heard from (see table) are unanimous in saying that there are no openings for non-English-speaking immigrants in this State. There are no foreign farmers in the counties heard from, except some Swiss in Adair County (not far from Laurel County, where is situated the Swiss colony referred to by the commissioner of agriculture), and no foreign farm laborers. All are negroes or native whites. Out of 9 farmers heard from 3 expressed a decided preference for negroes as laborers, 2 for native whites, and 1 stated there was "no prejudice against foreign labor."

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

CHRISTIAN COUNTY.—Good opportunities for tenant if he has energy and pluck. If tenant furnishes team and tools, gets two-thirds of crop; if owner furnishes team and tools, gets one-half of crop. Chances are good for purchase on easy terms.

BAIREN COUNTY.—Good chances for tenant. He gets one-third to one-half crop. Good for purchase if tenant can make one payment on land.

ADAIR COUNTY.—Fair opportunity for tenancy, but not much for purchase on easy terms.

CLAY COUNTY.—Very good opportunities to rent. Stock and implements furnished for one-half of crop. If tenant furnishes stock and implements, he gives one-third.

KNOTT COUNTY.—Good opportunity for tenant. He gets one-third of crop. Tolerably easy to purchase.

MADISON COUNTY.—No opportunity for tenancy or purchase; land too expensive.

ANDERSON COUNTY.—Tenant gets one-half crops, house rent free, wood, and stock to work crops. Good chance for purchase if man is economical.

OWEN COUNTY.—There are many tenant farmers, receiving usually one-half crop ready for market, with teams furnished, or grass furnished if tenant furnishes teams. For purchase, best plan is to work on tenant system until enough is accumulated to make payments on land.

ROWAN COUNTY.—Opportunities for renting or for purchase are not good.

TENNESSEE.

(See table, p. 627.)

The Nashville, Chattanooga and St. Louis Railway is interested in securing immigration to the State, and maintains an immigration department for that purpose. The agent of that department writes as follows with regard to opportunities for settlers, and general conditions:

This company has no land for sale, but it has secured a large amount on its lines suitable for colonization. There is no outlay for the maintenance of the agents except myself and one or two assistants. I should think that I have at present some 40 000 acres of land at my disposal. It is suitable for the greatest variety of crops, among others, wheat, corn, oats, barley, rye, buckwheat, tobacco, Irish and sweet potatoes, about 50 kinds of grasses, sorghum, cotton, peanuts, broom corn, cowpeas, beans, tomatoes, strawberries, celery, castor beans, asparagus, Kafir corn, melons, turnips, onions, fruit and vegetables of every character, including grapes, apples, peaches, pears, quinces, plums, and berries of various kinds. Besides these the land is well adapted to the growing of live stock, poultry and hogs.

These lands are worth from \$4 to \$10 per acre. We do not care about special classes of purchasers, but would be glad to have good Germans who will enter upon fruit and vegetable culture for the Northern markets. This special branch of agriculture has proved immensely popular. From one section was shipped in a single day 153 carloads of strawberries that caused to be distributed in that locality \$40,000 for a single day's shipment.

There are 1 or 2 colonies of foreign immigrants. The Swiss have a very flourishing settlement at Hohenwald, in Lewis County, Tenn. Another colony that has been long settled is at Belvidere, in Franklin County. These were also German-Swiss, and they are accounted the best farmers in the State of Tennessee, making the largest yield of produce and noted for the high character of their farms. Most of the immigrants that come to the State, however, come from the Northwest. Tennessee offers excellent opportunities for industrious farmers. A good deal of manufacturing is also now being carried on which requires a higher class of immigrants.

Yours, truly,

J. B. KILLBREW,
Industrial and Immigration Agent.

In addition to the colonies noted above may be mentioned the colony of Finns in Hickman County, established by Mr. Hornborg, general agent of the Finland Steam Navigation Company, an account of which, with other colonies planted or proposed by him, will be found on page 510 of this report.

There are, besides, some Italians in the State. Quite a number are engaged in truck farming in the outskirts of Memphis, and are very successful.¹

A certain "farm company" is now interesting itself in securing immigrants from crowded city districts to cultivate land in northwestern Tennessee. The following circular gives an idea of conditions in a part of the State to which immigration is invited, and of the advantages offered:

We have here a farm of 1,500 acres of cleared land on a tract of 3,000 acres, the same being located in the extreme northeastern corner of this (—) county, and is distant from 2 to 3 miles from ——. This land was cleared from a virgin forest since 1891, since which time all stumps have been removed from 800 acres of land, allowing the use of modern up-to-date farming machinery. This land is as good as can be found in the State, is rolling enough to insure good drainage. The land lies nearly in a square, being intersected by a creek diagonally across its entire length. All of this land is above an overflow from the Mississippi River, and is not subject to its backwater. The principal crops raised are wheat, corn, and hay. Cattle, sheep, hogs, and mules are also raised.

We do not rent, lease, or share crop any of this land, experience teaching us that our best interests require that we have all this work done by daily labor, and for that reason we will not consider any proposition to work any of the land in any other manner.

To this end we seek to settle upon this farm a number of families who are seeking steady employment the year round at a fair price, and we will do all in our power to surround them with a good and comfortable home after they have shown us that they are satisfied to remain, and providing, of course, that they give us satisfaction.

We pay the following prices for able-bodied male labor: 75 cents per day for January to April and October to December; 85 cents per day for May and September, \$1 per day for June, July, and August, with a prospect of better wages to the right parties. House and garden spot are free. Wood can be had in abundance, and costs you nothing but the trouble to cut and haul, teams are furnished free of charge for hauling. Settlements in full are made once each month in cash.

We will require references for character and working qualities, and will advance transportation to those furnishing satisfactory references, the amount of same to be refunded in easy monthly payments. We are willing also that you satisfy yourself that you will be fairly treated and that you will work for a responsible concern. This you can do by writing us your religious faith and we will give you the name of our local minister of the same faith, to whom you are at liberty to write.

We are anxious to place on this farm an honest, industrious, and thrifty people, those who know what farm life is and are willing and contented to follow it.

Those to whom this does not apply we say do not come, you will be wasting your time.

Yours, truly,

— FARM COMPANY.

Of 11 representative farmers heard from in 10 counties (see table, p. 627) 4 were of the opinion that non-English-speaking immigrants could find employment; 3 thought there would be little if any opportunity for them, and 4 thought there would be none. These opinions seem independent of the question whether foreigners had already found their way into the localities mentioned. In 3 of the 4 counties where there were said to be openings for immigrants, there were neither foreign farmers nor farm laborers. In 2 out of the 3 counties where Germans, Irish, and Swiss were found, there was said to be not much chance for immigrants.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

HAMBLÉN COUNTY.—There are good opportunities to become tenants. There is always land to rent on a variety of terms. Sometimes renter furnishes everything and gives one-third, or owner may supply seed and stock and take one-half. Land may be bought anywhere in this county on easy terms, but wages are low when it comes to paying for land while hiring out.

GILES COUNTY.—(1) Improvement in methods of farming and in farm implements is calling for a better class of tenants. Those could get land at a reasonable rental. There are good opportunities to purchase for good, honest men who will work.

¹ See p. 510 of this report.

(2) There are good opportunities for rental. The tenant can get one-half of the proceeds of the farm if he furnishes his own tools and farming implements. The prices for produce are very good.

MARSHALL COUNTY.—There is not much chance of renting desirable farms, and no opportunities for purchase on easy terms while purchaser hired out, as wages are very low.

MAURY COUNTY.—Most farms are small, and few are for rent. Where they are leased on shares one-half is usually given to the owner, and in some cases where the tenant stands the expense one third is given to the owner. There is probably no opportunity for a poor man to purchase a farm while earning a living hiring out. A man must have some capital to get started here. Land is high and profits in farming are not large.

WILLIAMSON COUNTY.—There are a few farms to let here. Tenant gives one-third to one-half the crop, according to agreement. The landlord furnishes land, seed, teams, and stock. In portions of our county land can be purchased cheap on yearly payments, near schools and churches. If a man is industrious he can rise right away.

HICKMAN COUNTY.—Land is leased to tenants for one-third of the crop, tenant furnishing stock. Land can be bought at from \$5 to \$30 an acre.

DAVIDSON COUNTY.—Farms can be had for \$10 an acre.

SUMNER COUNTY.—There are no opportunities for tenant farming and none for purchase on easy terms.

LAUDERDALE COUNTY.—Farms can be rented on easy terms provided the intending tenant has small capital. There are very good opportunities for purchase.

ORION COUNTY.—The tenant gets half the crop when furnishing team and tools, and feed for team. If landlord furnishes these in addition to rent, the tenant receives only one-third of the crop. There are good opportunities for good, industrious tenants. Land can be bought unimproved in this county at \$5 an acre; one-third cash, the balance in 1 and 2 years.

ALABAMA.

(See table, p. 629.)

The Louisville and Nashville Railroad Company maintains a general immigration and industrial department for the purpose of settling up land in Kentucky, Tennessee, Alabama, Florida, and Mississippi. The general immigration agent writes:

This company has made no special efforts toward inducing foreign immigration (by which I presume you mean newly-landed immigrants) into its territory, and it is only within the last few years that the Scandinavians and other northern Europeans have shown a disposition to locate in the district south of the Tennessee River. However, there is now such a disposition, but mostly on the part of those who have been residents of the United States for some years, and particularly in the Northwestern States. A good Scandinavian settlement has been started at Thoraby, Ala., which is on our main line about halfway between Birmingham and Montgomery. This colony is constantly in receipt of Scandinavian settlers. At Cullman, which is about halfway between Decatur and Birmingham, is a large and prosperous settlement of Germans. Germans, however, are found more or less throughout our territory.

Until the last few years the labor conditions in most parts of the South were such as to not encourage the migration of the great mass of foreign immigrants, who, even while taking up land, must depend largely on the sale of their surplus labor, at least, to insure their living for at least a few years while their lands were being made productive. But the last 2 years has shown a most remarkable advance in the demand for, and in the prices paid for labor, especially in the great coal and iron district of which Birmingham is the center; so that now that district especially presents a most inviting field for that class of people, especially those who are familiar with working in coal mines, coking plants, and iron and steel works. Land can be had very cheap in that district, as the surface is so broken by hills that it is not attractive to the general farmer, though it is productive enough, and can be used profitably in small farms of 20 to 40 acres. All the field, garden, and fruit crops can be grown there most successfully, and over a long season, as also poultry, etc. I think I do not exaggerate when I say that 50,000 families could find advantageous locations in that Birmingham district, where they could get their small tracts of land and where they could find most remunerative employment for their surplus labor, and it seems to me that the various Slavonic peoples would be best adapted to that situation.

As the company itself does not handle lands I would be unable to give specific information on the subject of prices and terms, though I know that in a general way such land can be bought in large lots as low as \$2 to \$3 per acre, there being one tract in particular of about 140,000 acres which can be bought, I understand, at \$2.

This mining and manufacturing district, then, which embraces probably 500 square miles and upward, would be best adapted to the foreigners I have indicated who are more or less familiar with working in mines, coking plants, and iron and steel works; and farther south the Gulf coast district presents a field of vast possibilities for the agricultural immigrants from southern Europe, Italy in particular. The land is cheap and all the conditions most highly favorable for the growing of fruits and garden crops of all sorts; in fact, in normal seasons garden crops can be made throughout the winter, and there is always a remunerative demand for such products.

A few Italians are to be found in our Gulf coast district, but no particular colonies of them.

In brief, it seems to have been the general consensus of opinion of Southern people generally that it was not worth while to make any great effort to attract foreign immigration to that section of the country. This, in my opinion, was a great mistake, as the millions of highly desirable Italian agriculturists who have gone to Argentina in the last 20 years should have been diverted to the Southern

States, where probably they would have succeeded better than they have done in Argentina. I do not know that there will be any decided disposition on the part of any railroad or other interests to make any particular effort to attract foreign immigration to the Southern States, the general belief being that it does not naturally incline in that direction, and much effort and expenditure of money would be necessary to accomplish any substantial results.

Yours, truly,

R. J. WENYSS,
General Immigration and Industrial Agent.

The "few Italians" spoken of in the above letter are probably certain colonies described in preceding pages of this report. They were located at Daphne, Baldwin County, and at Lamberth, Baldwin County. They are apparently very successful.

Representative farmers from 7 counties in this State report no foreign farm laborers in their neighborhoods, and very few foreign farmers. A few Germans and Irish are spoken of in Hale County, and a desire is expressed for Germans, Poles, and Irish to come in as farm laborers. Three of the 7 correspondents are of the opinion that there would be openings for immigrants.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

HENRY COUNTY.—There are good opportunities for renting. Stock is furnished, and house, and the produce is divided. There are fair opportunities for purchase. There are plenty of opportunities to rent farms for the sort of tenants wanted. Terms, one-half the proceeds. A poor man has a good chance to purchase. Land is reasonable, crops plentiful, and the country healthful. The soil is sandy, suitable for white labor, and a workman can always get help.

BUTLER COUNTY.—There are good opportunities to rent on shares or for cash. In this neighborhood opportunities for purchase are excellent. There are as many as 10,000 to 15,000 acres to be had at from \$4 to \$10 an acre.

LEE COUNTY.—Good opportunities to rent if tenant is willing to work and will not go too heavily in debt the first year. As for purchase while hiring out, it simply depends on the man.

HALE COUNTY.—In one instance, 3 brothers, Irishmen, took jobs of ditching and well digging, then rented land, a little at a time, saving their money and keeping to their work. They are now merchants and landowners, selling 400 to 500 bales of cotton a year, and are good citizens.

PICKENS COUNTY.—This county has fine opportunities for white tenants. There are good opportunities for purchase. Land is plentiful and can be had at from \$1 to \$10 an acre.

TALLADEGA COUNTY.—There are good opportunities for renting. A good white man can make satisfactory arrangements by which he can make money. He can find employment for his whole family. Land can be bought on payments.

MISSISSIPPI.

(See table, p. 630.)

The governor of the State wrote, in 1894,¹ that he was doubtful whether foreign immigrants were desired as laborers in Mississippi; but if any came, he thought Germans would be preferred to all others; second, Swedish; then, Italian. As there were no mining interests, and more artisans and skilled labor than could find employment, wages of unskilled labor for ordinary farm work were from \$8 to \$12 per month.

From reports received from representative farmers in 12 counties of the State, it appears that by this time quite a number of foreign farmers have made their way into the State. These are mainly Germans and Swedes, with a few Irish. In one southern county Germans and Swedes are mentioned as farm laborers; but throughout the State negro farm labor prevails. And there appears to be a decided preference for this class of labor, partly due to the preponderance of cotton farming in the State; partly to unfamiliarity with any other class of labor. One correspondent writes: "Negroes are preferred because no others have been tried; white labor on the large plantations would not be advisable. But on the smaller truck and stock farms a great many could find employment, both men and women." Another writes: "Yes, there are chances for immigrants, but they, as a general rule, do not take to our styles of farming, knowing nothing of cotton work, and no small grains in quantities are sown here except oats."

Another, however, complains of negro labor, saying: "The negro is employed here, but is getting to be worthless. We should like to have some good Germans or

¹ Page 504.

² Report Ind. Inv. Com. p. 141.

Swedes. The Germans and Swedes soon learn English and can be employed as carpenters, blacksmiths, brick masons and housebuilders." Another writes that the chances for immigrants are probably good, "although there are none of this class here." In fact, notwithstanding the prevalence of negro labor and the preferences expressed for that class, 6 of the 15 farmers heard from report opportunities for non-English speaking immigrants in their neighborhoods.

A few Italians seem to have made their way into the Delta country.¹ In testimony taken before the Industrial Commission an instance was given where a large plantation was rented out and subrented in small plots to negroes and Italians. There were about half a dozen families of the Italians. These Italian families made successful cotton farmers, being more energetic than the negroes. They do not stay long, however, as they soon make enough to engage in some other kind of business. On account of their very success in farming, then, they are considered less desirable as renters than the colored people, who stay on the farm. Italians are also found on sugar-cane plantations in the State.²

Not many farm hands in the State are hired by the month or day. The tenant system largely prevails. The lands in the State are still owned in large tracts, although not so large as before the war, and the system now prevailing is to let them out in small tracts (especially cotton land) to be worked on shares of the crop, or for a cotton rent.

The Illinois Central Railroad Company is making efforts to induce immigration to the Delta district. The land commissioner writes as follows, under date of June 20, 1901:

We have about 200,000 acres on the Yazoo and Mississippi Valley Railroad in the Yazoo Valley, Mississippi. We have just disposed of 50,000 acres of land grant in southern Illinois. The lands are suitable for all crops, but are specially used for cotton and corn. We have never had any success with foreign immigrants and have no agents for that purpose. All attempts to locate colonies from cities have proven abortive. Greatest success has been in locating individual farmers and sales to local residents.

Yours, truly,

EDWARD P. SKENE,
Land Commissioner

The Yazoo Valley, to which the Illinois Central is trying to bring settlers, was originally a great forest of hard wood timber, and up to 1881, when the Yazoo and Mississippi Valley Railroad was completed, there were not over 500,000 acres in cultivation. Since then nearly 1,500,000 acres have been put into cultivation. What the country now needs is thrifty, industrious immigrants with some capital. Cotton is the great staple product in this valley, where a bale to the acre may be grown, an ordinary yield being one-third of a bale to the acre. No fertilizing is needed, the soil being very deep and rich. Diversified farming is recommended, notwithstanding the large yield of cotton, to make cotton raising itself more profitable. Settlers who want to work for cash while improving their land will find abundant opportunity in the many sawmills along the line of the railroad.

A large proportion of the land owned by the railroad is in large tracts, suitable for colonies. One hundred or more families can be located on tracts of 80 or more acres of land which adjoin each other. These lands are sold at from \$7 to \$9 upward per acre, according to location and number of acres cleared. Terms of sale are, one-fifth cash, the balance payable in 1, 2, 3, 4, and 5 years, with interest at 6 per cent, payable annually.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

WILKINSON COUNTY.—(1) There are the best of opportunities for renting—better than in any other agricultural county in the United States. Land rents from \$1.50 to \$2.50 an acre, with house, wood, water, garden, and truck patch free, and often pasturage. There are good opportunities for purchase 4 or 5 miles from the railroad. Lands are cheap there—say from \$3 to \$7 an acre. These lands will frequently earn their purchase price the first year. (2) There are very good opportunities for tenants. Fair rentals are charged for lands. The share system is used by some. The landlord furnishes team, tools, land, and seed; also, half the fertilizer when used. Tenant furnishes half of all labor and gets half of all crops.

LINCOLN COUNTY.—Land can be bought cheap for cash or on credit or it can be rented.

COPIAH COUNTY.—There are good opportunities for purchase. Land is usually bought and paid for. This section is pine-ridge land and very healthy.

¹ Reports of Ind. Com., vol. x, p. 464-468.

² See page 503 of this report. See also some account of them under the heading "Alabama."

³ Reports of Ind. Com., vol. x, p. 471.

HINDS COUNTY.—(1) There are unusually favorable opportunities for tenant farmers, either on a lease or as a share worker for the landowner. Tenants that are sober and industrious are needed—as many as can be had. As to purchase, a tenant, if thrifty, can soon own land on very favorable terms. (2) Opportunities for tenant farmers are good. The tenant furnishes nothing but work and his own food and is allowed half the crop.

MADISON COUNTY.—There are plenty of farms to rent at low figures. Some can be had on long lease at \$2 an acre annually and some are worked on the share system. The landlord provides the land, teams, and farm implements and the tenant does the work. A great many have purchased land while earning their living by hiring out.

NEWTON COUNTY.—Opportunities for renting are very poor. As to purchase, land is cheap and there is no demand.

LAUDERDALE COUNTY.—(1) There are excellent opportunities for renting. Many a landowner would sell land to a tenant on time, to be paid for in farm labor. Opportunities for purchase are as good as anywhere. (2) In renting, lands can be worked on the share system, the landlord furnishing all the implements, teams, house, and feed for teams. The produce is divided equally. Land may be bought for from \$6 to \$15 an acre, according to quality of land, and can be paid for on the installment plan.

LOWNDES COUNTY.—Land may be rented for a money rent or a portion of the crop.

OKTIBBEHA COUNTY.—There is plenty of land to rent for \$2 an acre, the landlord furnishing house, fuel, and water. The tenant gets half the cotton, one-third of the corn, and one-half of other produce, the landlord furnishing everything. There are unsurpassed opportunities for purchase.

CARROLL COUNTY.—There are good opportunities for tenant farmers. At present there is a scarcity of labor. The prevailing rate on the share plan is one-fourth of the cotton or one-third of the corn, or a stated rent of so much cotton or so much money—from \$2 to \$5 an acre, according to the quality of the land. There are good opportunities for purchase—none better anywhere.

PRENTISS COUNTY.—There are good opportunities for renting. Landowner furnishes land, team, seed, and implements for half the crop, or lets the land for one-third of all grain crops and one-fourth of the cotton crop. There are good opportunities for purchase. Land is cheap and any man here who wants employment can get it at any time.

MARSHALL COUNTY.—The best opportunities that there are, perhaps, in any country, as the labor of women and children is almost as valuable as that of men in the cotton fields. Most of the farming is done on shares. The owner furnishes the land, plows, stock and feed for stock, all tools, wagons, house, and garden spot, receiving one-half of the crop. The laborer puts in his labor only and feeds himself and family, supplies being furnished by the proprietor and paid for when crop is gathered and sold. Garden, potato patch, and melon ground is furnished for laborer's family without rent or cost to them.

As to purchase while the purchaser is hiring out, many negroes are now getting homes for themselves in just this way, and any industrious family could soon have a home. I sold off land to some of my ex-slaves's children, who never left the place when freed, and they have almost finished paying for their land. They will get it paid for in four annual payments.

LOUISIANA.

(See table, p. 632.)

The State maintains an immigration department in connection with the bureau of agriculture. The commissioner of agriculture and immigration writes as follows (December 19, 1900), with regard to opportunities for immigrants at the present time:

First. It is my opinion that there is a greater opportunity for immigrants in our State at this time than has previously existed. The great opportunities are in the manufacturing lines and in farming operations.

Second. From foreign countries, Swedes, Germans, Scandinavians, and Hollanders are preferable. From our own country, farmers from the North and West are desirable.

Third. The foreign farmers, after they become familiar with the soil crops, make equally as good farmers as do the natives. It is through the new and special lines of farming to which they are adapted, more than it is with the native population.

Fourth. Our farmers, as a class, do not oppose the influx of foreigners if they are honest and industrious. On the contrary we welcome them.

Fifth. Efforts are being made through this department to encourage immigration by supplying literature and other information relating to the State's resources. In addition, there are many private corporations, land companies, and real estate agencies.

Very truly, yours,

J. G. LEE, Commissioner.

The representative of one of the private corporations referred to writes as follows with regard to the methods employed and opportunities offered by his company in the northern part of the State:

Your favor of the 11th instant was received and contents noted carefully. In reply we beg to state that you will please find inclosed under separate cover, of this date, two of our latest pamphlets, which were prepared for the purpose of reaching parties living at a distance. This pamphlet explains fully the conditions of the country surrounding Shreveport, La., and the country along the west shore of the Mississippi River in Louisiana, consisting of the parishes of East Carroll, Madison, Tensas, and Concordia. We were successful in interesting a great many people from the Northwest in diversified farming in a small way around Shreveport, but during the past 2 years we have been giving our entire attention to the development of the country in the parishes of East Carroll, Madison, Tensas, and Concordia, on the west shore of the Mississippi River. This is virtually an undeveloped country, these parishes being practically without railway transportation, and about one tenth of the land being in cultivation. There is as fine hard-wood timber on these lands as there is to be found in the United States. After the timber is removed they are particularly desirable for farming purposes, for the cultivation of fruits of all kinds, cotton, corn and rice. At this time we have our surveyors in the field and are having arrangements made to build a railroad from Lake Providence—the parish seat of East Carroll Parish—to Vidalia, La., the parish seat of Concordia. This road will run through the center of four parishes and will be the cause of development, in a short time, of this entire country. We control about 300,000 acres of these fine hard-wood and alluvial lands, and are making a specialty of interesting the investor and farmer in this section. We are very anxious to encourage immigration to this country, and nowhere in the South are there such opportunities as there are right here.

Very truly, yours,

REALTY CO., LTD.

In the southwestern part of the State there is, besides the usual cane, cotton, and corn raised, a considerable production of rice. It is interesting to note, in connection with an inquiry that is dealing with agriculture especially in relation to foreign immigration, that, while rice had been raised for many years in Louisiana in small patches for home consumption, the idea of raising it for market originated with a little band of German farmers who had settled in what is now the northern part of Acadia Parish.¹ This was in 1885. Irrigation was introduced in this district in 1890, to the great improvement of the rice industry.

A private land company operating in this district writes as follows with regard to foreign settlers, prices of land, etc.:

First. We have very few foreigners in southwest Louisiana, the oldest settlers being descendants of Acadians who were driven out of Nova Scotia. They are of French descent. The later arrivals are coming from all of the Northern and Western States, largely from Illinois, Michigan, Indiana, Iowa, Kansas, and Nebraska. We suppose that in the three or four parishes constituting what is known as southwest Louisiana 25,000 Northern and Western people have located during the past 10 or 12 years. With reference to our lists of land we will say, including our own individual lands, we have listed for sale about 1,000 acres. These lands are usually sold on terms of one-third cash, balance in 1 and 2 years. Rice lands located along the irrigating canals, where they are sure of water every year, have a range in price of from \$20 to \$50 per acre, according to location, nearness to churches, markets, schools, etc. Excellent cotton and corn lands may still be purchased at from \$10 to \$15 per acre. Twelve years ago these lands were worth from 50 cents to \$1.25 an acre.

Yours, very truly,

W. W. LUSON & BRO.

Another correspondent interested in the sale of land in this district writes:

We have a very thrifty and rapidly increasing colony of Dunkards between this town and Jennings along the Southern Pacific Railroad. They are engaged principally in raising rice, which is the best money crop for this locality. In nearly every case they own their own land; some of them are entirely out of debt, others owe a balance because they have only purchased recently and have had but one or two crops on their land, but the land is increasing rapidly in value since they purchased and is now worth two or three times what they paid for it.

We still have for sale something like 650,000 acres of land, and of course in such a large body the quality varies. We have good rice land, very fine pasture land, and we have other lands that are too low and wet for agricultural purposes until considerable sums have been expended for drainage, etc. We also have quite a large area that geologists pronounce very promising in the matter of petroleum, but we are not at present engaged in making any investigations or borings for oil.

Very truly, yours,

Manager.

Reports were received from representative farmers in seven parishes of the State, two in the southern portion and five in the northern (see table, p. 632). From one of the southern parishes it is reported that Germans, Italians, and Swedes are found as farmers; Italians as farm laborers (on large sugar plantations only²), and that there are good chances for foreign immigrants. From the other parish (Acadia, the rice district) few foreign farmers, no foreign laborers, and few openings for foreigners are reported.

In the northern parishes three correspondents state that there are good chances for foreign immigrants, and at the same time report no foreign farmers already there except Germans in one parish, and no foreign laborers, while, curiously enough, the two correspondents who state that there are no chances for immigrants report foreign farmers (Germans, Irish, Swedes, and Mexicans) already established in their neighborhood.

¹ Crowley Signal, October 6, 1900.

² But see statement of Sr. Mastro-Valerio, page 495 of this report.

As in most of the Southern States, there is now more or less effort made to diversify farming, especially in the northern part. This will naturally create opportunities for European immigrant families with dairy work and fruit and vegetable farming.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

IBERIA PARISH.—The opportunities for renting are very good. The tenant may furnish his team and implements and receive half of the crop, or simply furnish his labor and receive one-third of the produce. A poor man who is willing to work can easily buy a small farm on payments of 1, 2, or 3 years, or he can rent the land at a moderate figure, say \$2 or \$3 an acre.

ACADIA PARISH.—There are good opportunities for renting if a tenant has means to furnish his teams and seed. Lands are on a basis of one-third cash, balance in 1 and 2 years.

WINN PARISH.—There are good opportunities for renting and purchase.

TENNES PARISH.—There are plenty of opportunities to rent on easy terms and good opportunities to purchase. Land is comparatively cheap, but is rising.

RICHLAND PARISH.—Tenant farmers are what the community needs. The tenant gets one-half. The landlord furnishes stock, implements, etc.; or the tenant furnishes everything and gets three-fourths. There are good opportunities for purchase.

CLAIBORNE PARISH.—There is a first-class chance for renting on very good terms. As to purchasing while purchaser earns a living by hiring out, no better place can be found to do this very thing.

CADDO PARISH.—There are good opportunities for renting on almost any terms. Usually the tenant gets one-half the crop, the owner furnishing tools and farming implements. There are good opportunities for purchase.

TEXAS.

(See table, p. 633.)

The acting commissioner of agriculture wrote, in 1894:¹

Texas desires immigrants who are sober, industrious, and worthy— who will make good citizens and add to the wealth and prosperity of the State. * * * Unskilled labor is needed in every pursuit in which labor performs the principal agent for developing the resources of the State. But to all of this a word of great caution should be impressed upon each immigrant. None should come into the State without some definite agreement with those who may need and desire their labor, for they can not get employment everywhere in so large an area and might suffer before an employer could be found.

As to present conditions, representative farmers were heard from in the Brazos River region, but in that region only. There was a general agreement among them (with one exception) that chances for foreign immigrants were good. No foreign farm laborers were reported in these counties, but foreign farmers were found in all but one—Germans, Swedes, Danes, Bohemians, Poles, and Italians. One correspondent, indeed, stated that negroes were preferred as laborers in the Brazos River bottoms, on account of their ability to withstand the malarial influences prevalent there, and another seems to think negro labor preferable, as more docile than white. "We do not want any strikers," he says, "and we find the whites are more apt to strike than the negroes."

Several railroads are interested in bringing settlers to Texas.

The land commissioner for the Southern Pacific and Houston and Texas Central writes:

The quantity of land at our disposal is approximately 4,000,000 acres. This land is distributed over 120 counties in the State of Texas, and is therefore adapted to the growth of corn, cotton, wheat, oats, sorghum, rice, and all manner of fruits, vegetables, and melons indigenous to this climate. We have no special preference for purchasers so long as they have sufficient means to make a part payment on the land and work the same after they have bought it. We of course prefer the actual settler to any other class of purchasers.

We reach foreign immigrants through our European agent, who has offices at Hamburg, Antwerp, Rotterdam, London, and Liverpool. We have never established any colonies of foreigners in this State, but there are colonies which have been established in years past which have been remarkably successful, notably the German colonists in the vicinity of New Braunfels and a Scandinavian colony in Travis and Williamson counties. There is a very large German population scattered over the country between Houston and San Antonio, the majority of whom are engaged in agricultural pursuits and are all in a prosperous condition.

¹ Report Immigration Investigating Commission, p. 150.

We maintain agents in the counties in Texas where the lands are upon the market for sale, and advertise throughout the United States and Europe, setting forth the advantages of Texas as an agricultural and grazing country. Our prices range all the way from \$2 to \$7 per acre, according to the character of the soil, proximity to railroad transportation, water facilities, etc. Our terms on grazing and agricultural lands are one fifth cash, balance in four equal annual payments at 6 per cent interest per annum deferred payments secured by a lien upon the land.

Yours, truly,

C. C. Gibbs,
Land Commissioner.

The land and tax commissioner of the Gulf, Colorado and Santa Fe writes:

This company having disposed of nearly all their lands are not maintaining agents for the purpose of locating immigrants except what is being done by our general passenger department and in a general way by advising people as to the inducements in this great State for settlers.

Yours, truly,

F. M. GILBOUGH.

The International and Great Northern, the Texas and Pacific, and the Missouri Pacific railways jointly maintain a land and immigration department, and are bringing to the State people of all nationalities, but reach only those who have located somewhere in the United States.

Texas was one of the objective points of the earlier Bohemian immigration, and many of this nationality are now found there. The first settlements here were made in 1855. This is the only Southern State where Bohemian settlers are engaged in agriculture to any appreciable extent. Bohemians are found in the following towns and villages of the State: Ammansville, Antioch, Bartons Creek, Bluff, Bryan, Caldwell, Cistern, Corn Hill, Dubina, Ellinger, Fayetteville, Frelsburg, Freestat, Granger, Halletsville, Industry, Montlon, Plains, Praha, Sealy, Sedan, Shiner, St. John, Schulenburg, St. Mary, Settlement, Sweet Home, Taylor, Nada, Waller, Wallis, Warrenton, Weimar, West, Yaakum, Yueton, and Zee Wee. There are said to be about 57,000 Bohemians in the State, all told.

An account of the Italian settlers in the State will be found on page 500 of this report.

These Italians are engaged in rice culture, in cotton planting, in grape culture, and especially in truck farming near large cities. There is a colony at Bryan, Brazos County, one near Dickinson, and another near Gunnison.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

BRAZORIA COUNTY.—There are good openings for tenants and good opportunities for purchase on payments while earning a living hiring out. The writer started in this way and there are many others.

HARRIS COUNTY.—There are good opportunities for renting, but northern Texas is more desirable. As to purchase on time while hiring out, this is being done here every year. Judgment and industry coupled with economy will succeed here.

BRAZOS COUNTY.—There is plenty of opportunity for tenant farming on shares. The owner furnishes team, tools, etc., and feed for team and receives one-half the product. The landowner will furnish supplies to the tenant to be paid back when the crop is made. There are good opportunities for purchase for an economical, sober, and industrious man. Plenty of them come here without a penny and some of them now own their own little homes.

LIMESTONE COUNTY.—There is a good portion of land worked by tenant farmers. Team and tools are furnished for half the crop, or one-third grain and one-fourth cotton if tenant furnishes team and tools. Opportunities for purchase are good. Lands are reasonable in price and usually can be had on easy terms.

HOOD COUNTY.—There are good opportunities for renting for from one-third to one-fourth of the crop and fine opportunities for purchase.

ARKANSAS.

(See table p. 634.)

In 1894 the governor of the State wrote with regard to immigration and the natural resources of the State as follows:¹

All portions of our State desire home-seeking immigration. * * * We produce everything in the agricultural line which is produced in this zone. * * * We prefer American, German, and English immigrants (farmers), but welcome all desirable immigrants.

With regard to present conditions and needs, the commissioner of mines, manufactures, and agriculture writes, under date of December 22, 1900:

First. In my judgment there have never been offered opportunities in this State to immigrants equal to those offered at present. The steady increase in the avenues of labor furnish thousands of men

¹Report Immigration Investigating Commission, p. 127.

employment who were a few years ago entirely cut off from such advantages. Those advantages have come principally through the vast increase in mining, manufacturing, and improved methods of agriculture. Not until the last few years have our people interested themselves in cotton mills, while now we have several in operation, and a large number in course of construction. The same is true in our mining districts. The mines that were lying idle a few years ago, principally from a lack of proper railroad facilities, are now in active operation. Cotton pickers have for many years been in demand in Arkansas, but it has only been within the past few years that apple and berry pickers are in the greatest demand during that season of the year. There is still another element, which is especially to the advantage of the permanent homeseeker, and that is the fact that our heretofore unsettled portions of the country are being rapidly taken up, and a man now that wishes to take advantage of the United States homestead law and enter a tract of land is not compelled to isolate himself from all advantages of schools and churches, but may enter the land within a neighborhood already started. We still have about 5,000,000 acres of Government lands subject to entry.

Second. It is my opinion that as a rule the German people are the most effective farmers in this State. However, I have taken notice of the fact that Northern stockmen outgeneral our people in realizing the great advantages offered here for stock raising. Of the gardeners and truck farmers, the German people far surpass all other classes of farmers.

Third. Their success in my opinion is due to their more intense methods of cultivation. They seem to appreciate what our people have had lying at their door for years, and have never realized the greatness of the opportunities offered. As a general rule, a first class German farmer will make more truck on 5 acres of good ground than an ordinary American farmer will make on 20 acres. This, however, is being rapidly overcome by the farmers organizing and informing themselves upon questions pertaining to diversified farming. Too many of our American, or I may say in this State, Arkansas farmers, have been taught to depend too much on cotton for everything, but they are fast getting over this idea, and grain, stock, fruits of most all kinds, vegetables, both farm and garden, are now grown and shipped in large quantities.

Fourth. Our farmers favor the influx of foreigners into this State. We claim that no State in the Union will meet the foreigner with a warmer welcome than the State of Arkansas.

Fifth. We have several organizations in this State, organized for the express purpose of inviting immigration to our State. Among these may be classed this department of the State. We keep a large amount of immigration literature on hand and at all times take pleasure in answering all inquiries from parties seeking to know more of the advantages this State offers immigrants. There are also other organizations that may be addressed for like information.

Sixth. Many agricultural colonies have organized in this State, especially of the German race, as this is a great grape and truck farming place. In Johnson County alone there are some four or five colonies. In Prairie Lonoke, Arkansas, and White counties there are numbers of colonies of Northern people located, and in Drew County there are also colonies of Northern people engaged principally in the raising of stock.

Very truly, yours,

FRANK HULL.

Near Searcy, White County, a tract of 24,000 acres was settled by 20 Hungarian families. The land was sold by the Iron Mountain Railroad. The colony failed, however, and removed to Alabama.

In Cleburne and Van Buren counties, in the neighborhood of Searcy, efforts are being made to bring settlers to the neighborhood. In these counties alone there are said to be more than 360,000 acres of Government and State lands, subject to homestead and donation, at a cost only of Government and State fees and locating the lands. For a quarter section, Government fees are \$14, State fees are \$10. These are timber lands, and are situated in the fruit belt of the State.

Italians were colonized at Sunnyside, in the southeastern part of the State, but were unsuccessful for reasons that were out of their control. Some of the colonists removed to Tontitown, near Springdale, where they now are.¹

Returns from representative farmers were too few in number to afford information as to general conditions. Three of the four heard from, however, agree with the commissioner that there are opportunities for immigrants. Few foreigners are noted either as farmers or laborers. In Arkansas County Germans and Swedes are mentioned and a colony of Slovaks.

Another colony of Slovaks was established near Little Rock, in a settlement called Slovaktown, but it was not successful. The people were disappointed, colonization ceased, and only about 60 families remained.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

OUACHITA COUNTY.—Good opportunities to rent on halves, thirds, or fourths. Very good chances for a poor man with energy to establish himself in independent farming.

ARKANSAS COUNTY.—There are good opportunities for renting. Farms can be had at from 50 cents to \$1 per acre. A man can sometimes get land where the owner furnishes everything. Opportunities could not be better anywhere for a poor man to get a home on long payments or for work. Land sells for from \$5 to \$10 an acre for farming land; timber land is cheaper.

CLEBURNE COUNTY.—In renting the tenant gets two-thirds of the corn, three-fourths of the cotton, one-half of the oats and peas. As to purchase, this is a timber country. A man can buy land on time here and find plenty of work to do.

BENTON COUNTY.—(1) There are good opportunities for renting. Tenants can either rent land for one-third of the crop and furnish everything, or work on halves

¹ Page 565 of this report.

with everything furnished. There are fine opportunities for purchase. A man who is of any account can start flat-footed and in 3 or 4 years own his farm. (2) Very poor opportunities for renting. Everyone owns a small farm and does the work himself. There are no chances for a poor man to purchase. A man has no business here unless he has a few thousand dollars to start with.

WESTERN STATES.

GENERAL.

A representative of the Southern Pacific Company writes as follows with regard to the general question of the distribution of foreign immigrants on the Pacific coast:

Permit me to say that our country is much too far from the Atlantic seaboard to attract many European immigrants. Cost and time constitute obstacles to the immediate receipt of immigrants from Europe. Besides, our country is not well known to the common people of Europe; hence people must reside in the United States some time before they become apprised of the desirability of the territory lying west of the Rocky Mountains as a place of residence. Common labor is in very great demand in the Pacific States and Territories in mining, agriculture, horticulture, in lumber enterprises, in commerce, in railroad, and in fact in all industrial and commercial pursuits. If immigrants proceed immediately to the Pacific coast, it is because of some special reason, some friend or some relative who resides there having induced that course, and only the more thrifty and those in better circumstances will ever attempt the trip.

What we do receive, therefore, is of a special class. We have made no special appeal to foreign immigrants, and will not do so because, as a rule, the foreign immigrant is simply capable of common labor, and nearly all the labor of our country is skilled. Horticulture, mining, railroading, and the lumber business are in a measure skilled occupations.

We have projected no colonies upon railroad lands in the Western States because in a very large measure the lands were unsuitable for colonization. The lands were granted in alternate sections, not in solid bodies. Nearly all of the better agricultural land belonging to the companies I represent was disposed of some time ago.

Our country offers inducements to intelligent people, and we are receiving accessions of population, but largely of the class of foreigners who have resided in the country some years, or their children who were born here, or native Americans. We prefer the latter class, and our country, by reason of its remoteness, is receiving perhaps the best class of immigration of any portion of the United States.

I can furnish you no statistics relating to numbers.

Yours, very truly,

WILLIAM H. MILLS.

The Northern Pacific Railway has land to dispose of and has done something in the way of attracting settlers, but not especially among foreigners. The land commissioner writes as follows:

The land grant of this company undisposed of amounts to about 20,000,000 acres, but a very large portion of it is unsurveyed and in mountainous districts, and is consequently not suitable for settlement. The lands acquired by this company in eastern North Dakota and Minnesota were chiefly suitable for agriculture, but are all disposed of and are now in the hands of settlers and land companies. The bulk of the lands owned by this company now, aside from lands valuable for their timber, are mostly only suitable for grazing except limited areas in the States of Washington and Montana, which can be utilized for agricultural purposes by irrigation. The cost, however, of putting water upon them is more than the present value of the lands would warrant. This company has an emigration department, but the duties of the head of that department have been mostly confined to furnishing information and advertising the territory tributary to our road. We have done no work among foreign immigrants, chiefly for the reason that we have no lands of suitable character in sufficient quantities to warrant the expenditure.

Yours, truly,

WM. H. PHIPPS, *Land Commissioner.*

The general emigration agent writes in further detail as follows:

This company, during recent years at any rate, has not done any work at all among foreigners abroad, except to send publications in a few cases where persons in Europe or other parts of the world have written requesting the same. We have not, however, had any agents in other countries working up emigration, nor have we any foreign agents especially at work among foreigners in this country. There are colonies of different nationalities at various points along our line, and their fellow-countrymen are joining them all the time. It is also true that persons who have come over from the old country frequently send back for other members of their family to come over to this country to them.

The nearest we have come to the kind of work that I take it you have in mind is our colonizing of Hollanders in the Gallatin Valley in Montana and the Yakima Valley in Washington, but even here our labors have been confined principally to those who were already located in other States, principally Michigan, Iowa, and South Dakota. Some have gone from the cities, but the most part were already engaged in farming.

Yours, truly,

C. W. MOTT, *General Emigration Agent.*

MONTANA.

(See table, p. 635.)

The secretary of the State and land grant commission writes as follows with regard to opportunities for immigration in the State:

Until there is more done in the way of building irrigation ditches, Montana can not invite immigration. There are no efforts being made to attract the immigrant for the reason that all the land capable of inexpensive irrigation has been taken. With Government aid in the storage of water and construction of the main canals from 8 to 10 million acres of land could be reclaimed, when an immigration bureau would be useful. The majority of the farmers in Montana are Americans, but the Germans and Scandinavians would be encouraged to come when we have irrigated lands to offer them.

Truly, yours,

D. A. CORY, *Secretary.*

Reports from representative farmers show (see table, p. 635) that even now there are thought to be openings for non-English-speaking immigrants. In 6 out of 14 counties heard from there are said to be such openings; in 9 of the 14 foreign farmers are said to have already established themselves, and in 11 counties foreign farm laborers are found. The report of persons naturalized in the State in 1898¹ gives some idea of the different nationalities now there. The number and nationality of persons naturalized was as follows:

Persons born in		Persons born in—	
Ireland	572	Switzerland	29
Austria	354	Denmark	24
Canada	352	France	22
England	239	Russia	22
Sweden	194	Wales	21
Germany	162	Belgium	9
Italy	127	Bohemia	3
Norway	119	All other	54
Finland	112		
Scotland	84	Total	2,490

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

DAWSON COUNTY.—No farming is done here.

PARKER COUNTY.—Opportunities for renting are fair. Usually tenant receives one-half the crop, landlord furnishing everything. Land can be purchased on 5 to 10 years' time.

SWEET GRASS COUNTY.—There is a good chance to establish oneself in independent farming. Government land may be taken up as a homestead.

MEAGHER COUNTY.—Opportunities for renting are not numerous, and the chances for a poor man to establish himself are not good.

PERCIE COUNTY.—There are good chances for renting on all kinds of terms, cash or on shares. Opportunities for purchase are not good in this section.

CASCADE COUNTY.—No renting is done in this county. There are good chances for purchase while the purchaser earns his living by hiring out. Industrious, energetic young men are doing it all the time here.

TETON COUNTY.—There are always opportunities to lease farms. There would be numerous opportunities for a man to purchase land while hiring out, but probably a better plan would be to take up a homestead on Government land and work for wages upon which to improve it. There is plenty of good Government land open for sale here yet.

CHOTEAU COUNTY.—There are very few renters, or farms for rent. There are the best opportunities in the United States, and that is the best in the world, for a poor man to establish himself in independent farming.

MADISON COUNTY.—A man may become a tenant farmer on almost any terms he may want if he is a good man. There are fairly good opportunities for purchase.

JEFFERSON COUNTY.—There are quite good opportunities to rent either for a cash rent or on shares, everything furnished except seed; and there are good opportunities for purchase, especially by a part payment.

SILVERBOW COUNTY.—There are good opportunities for renting; terms, one-half of the produce; and also good opportunities for purchase.

GRANITE COUNTY.—There are not very good opportunities for renting, and none for purchase on easy terms.

MISSOULA COUNTY.—There are good opportunities for renting and purchase.

FLATHEAD COUNTY.—Little farming done here.

COLORADO.

(See table, p. 637.)

The immigration commissioner wrote in 1894 that Colorado then desired first-class immigrants in nearly every portion of the State. Agricultural and horticultural resources needed development, and for horticulture and agriculture Germans and Swedes were preferred.

With regard to present conditions the secretary of the Denver Chamber of Commerce writes as follows:

First. There are better opportunities in Colorado for immigrants than ever before. Farm laborers, ranch hands, miners, smelters, and common laborers are always in demand.

Second. As general farmers or farm laborers Germans or those of German extraction are more effective. For truck gardening in the vicinity of cities Italians seem to take the lead.

Third. Foreign farmers, by reason of their old-country habits of thrift and economy, and by reason of their being accustomed to more intensive methods of cultivation, succeed in many cases where native-born agriculturists fail.

¹Seventh annual report of State bureau of agriculture, labor, and industry, p. 434.

Fourth. Farmers as a class do not oppose the influx of foreigners into this State.

Fifth. Railways and corporations engaged in the production of beet sugar are making efforts to attract immigrants to various portions of this State.

Sixth. I know of no agricultural colonies or settlements of foreigners in Colorado.

Yours, respectfully,

ARTHUR WILLIAMS, *Secretary.*

The representative of one important beet-sugar company writes as follows with regard to the opportunities open to foreign immigrants in this industry and to inducements offered:

It seems that a solution of the beet-sugar industry in the United States is dependent upon a class of foreign laborers which are at this time only too scarce. Our company is using every endeavor to encourage such immigrants to come here, either from abroad or from some other part of the United States.

This location is a very fortunate one, in that we are, because of our isolated position, enabled to pay such high prices for beets that are grown here. This great valley is surrounded by a still greater mining region which must be supplied with farm products and with sugar, for all of which we receive the very highest prices. Our plans change with our needs, and our procedure of to-day may change for to-morrow, even as the one of to-day is vastly different from those of a few weeks past.

We have been offering our houses, land, and water, free of rent, to people who would grow beets for us. This land, however, will soon be gone, yet we have not reached the capacity of our large factory, and for the coming year we may be in a position to make offers similar to that which we made this spring, but we can not say to-day that we will. Therefore we can only outline in a general way what we can and will do for immigrants.

We have not made an organized effort to bring foreigners to this place.

It would seem to us that in order to formulate and carry out successfully some plan of this sort, it would be necessary for us to purchase a large body of land and hold intact until some definite movement be made to bring here as a whole a great colony. In this respect we would have to determine definitely whence these people would come, what their wishes would be, and their financial ability.

Last year Mr. _____, who was then secretary of this company, went to Germany, his old home, and, so it is understood, attempted to secure a colony. None, however, was brought to this country, and as he has become heavily interested in another plant in this State, and as we have not heard of the German colony coming, the inference is that he did not succeed. Such a plan is far-reaching and hard to work out.

This company started in a small way this year by purchasing about 2,000 acres of the best land in the country and is offering it as per the inclosed circular letter. In a very few days we were flooded with applications from people without means, and it became necessary for us to issue our circular letter of April 6 and to adhere to its terms.

The only people that we have secured are those from Utah and various parts of Colorado and her border States.

We would think that a good plan would be to go into sugar-beet districts of Germany and try to secure settlers.

From the writer's experience of a few months in the business, it is very apparent that the people who grow beets must be taken care of from the very first, and this paternalism is, in all probability, more necessary with foreigners than with our people.

One thing to be considered is that of the wishes of these people relative to the purchase of homes. Abroad they are tenants and the descendants of tenants.

It is observed that after people acquire a small competence growing beets, they leave the arduous work for something lighter, and unless the company owns the land, thereby being able to put upon it other people who must come and start in life, it finds itself without a supply of beets for its factory, and without ground upon which to place people who are willing to grow this supply.

It is not to be assumed that it is our desire that these people should always remain our tenants, for, after being on our land a while, we would expect that they would be free and independent to buy some of the cheap land which is offered for sale, and thereby own their own homes. That is desirable for the general good of the community, and there are splendid opportunities for immigrants in this manner to acquire homes for themselves in a few years. The action of our company would be to bridge over for these people that period of necessity in which they must live, and in which they will doubtless be able to accumulate a little money, and eventually become landowners themselves. We would not be afraid of these few, for, with a colony started, others from the same locality in the old country would be coming continually, and filling the places of the first arrivals who might go upon their own holdings.

The above letter, it will be noted, brings into view very clearly the following points of especial interest with regard to the foreigner in sugar-beet culture: First, the evident necessity of more or less control by the factory of individual growers, to which foreigners are more likely to submit kindly than American farmers; second, the tendency of growers to leave this industry as soon as they have earned a little money at it; third, the consequent dependence by the factory upon a class of tenant laborers, who, like the newly arrived foreign immigrants, are without much money and are making a start in life.

The representative of another company writes that they have not tried to get foreign immigrants as settlers, but have endeavored to induce Eastern farmers to settle on their land and have succeeded fairly well. At least enough families were secured to care for the beets during the present season, and no encouragement could be given to intending settlers until the coming year.

Still another beet-sugar concern heard from reports that, as their factory is located in a well-settled district, it is not their intention to do any colonizing. The representative of the company says:

The only labor we have made any effort to secure thus far has been Russian families who are more or less familiar with beet culture, whom we expect to draw from the western portion of Nebraska in limited numbers.

These families on their arrival here contract with the growers in various localities for doing the hand work on the beet crop. Many of them engage at a stipulated price per acre to do this work, while others hire by the day.

As our company is not planting any considerable acreage of its own, we are only able to bring in this labor to assist the growers in the handling of their crop.

Not directly for the purpose of colonizing foreigners in the rural districts, but indirectly doing so, are the land colonies of the Salvation Army, in Amity, Prowers County, Colo., and Monterey County, Cal. These colonies were founded to make homes for "the worthy poor of our great cities," according to the circular issued by the army, and as many foreigners fall within that class, the colonies will naturally be of considerable assistance to them.

The colony at Amity is established on 1,338 acres of irrigated land, not far from a large beet-sugar factory, which contracts to purchase from the colonists at remunerative prices all the sugar beets they can grow. About 160 colonists are now settled here.

Most of the colonists understand farming. Those who do not are skilled artisans. Schoolhouses, a large orphanage, and a "Workingmen's Sanitarium" are built, or about to be. The colonists are assisted with loans, etc., to purchase implements, stock, etc., and are given time to pay for their land. The enterprise is supported by interest-bearing bonds secured by mortgage on the lands.

Reports from representative farmers in this State are few in numbers (see table, p. 637), but represent the different parts of the State. They show the presence of the sugar-beet industry, and abundant opportunity for married men and their wives and children on the farms. Foreign farmers and farm laborers are noted in all of the counties but 1, and in 3 Swedes or Germans are said to be preferred as laborers.¹ In 3 there are said to be opportunities for immigrants who do not speak English.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP

(Reported by representative farmers.)

PROWERS COUNTY.—Farms may be rented on shares. Tenant pays half crop if landlord furnishes seed; one-third of crop if he furnishes seed himself.

OTERO COUNTY.—There are good opportunities for renting. Farms are usually rented on shares. Alfalfa crop, one-half goes to owner; other crops, one-third to owner. As to purchasing land while hiring out, any man has a chance. I started in that way myself.

ARAPAHOE COUNTY.—There are many good opportunities for tenants if they are good, industrious people. They get one-third to one-half of the crop. The opportunity for purchase while hiring out is good. I got my start in that way.

JEFFERSON COUNTY.—(Opportunities for renting are good for practical farmers. The tenant gets one-half the crop with seed furnished, or two-thirds of the crop if he furnishes the seed himself. Good opportunities for purchase for an energetic, practical man; none for drones.

LARIMER COUNTY.—Good opportunities for tenants who are able to furnish their own tools. Terms are usually a share of the crops as rent, one-half to two-thirds. There are reasonably good opportunities for purchase.

ARIZONA.

(See table, p. 638.)

Representative farmers in only 3 counties reported as to agricultural conditions—Cochise, Maricopa, and Yuma. Farming in the 2 latter counties is done with the aid of irrigation. Maricopa County contains the Salt River Valley, where some 200,000 acres are now under cultivation, reclaimed from the desert by means of irrigation. The settlement is about 10 years old. Labor is in great demand, especially in hay and fruit harvest.

In Maricopa County are said to be many Scandinavian farmers, some quite wealthy. In Yuma are a few German farmers. In none of the 3 counties are European farm laborers spoken of, but 2 of the 4 farmers reporting thought there were good openings for immigrants.

Under the desert-land act, land may be entered for \$1.25 an acre by citizens of the United States, who also are or intend to become citizens of the State or Territory in which land is entered, on condition that they intend to reclaim the tract of land applied for by conducting water thereon.

¹ Groups of Italian truck farmers are found near Denver and Pueblo. See p. — of this report.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

COCHISE COUNTY.—Very good opportunities for a few to rent for a money rent or on shares. If he is a practical farmer, a poor man would probably do well in trying to purchase.

MARICOPA COUNTY.—There are plenty of good opportunities for renting, but some capital is needed, and there are good opportunities for purchase. A good many Scandinavians and Mexicans have bought lands. Other nationalities are fairly well represented. (2) There are good opportunities for renting and good land can be had at all times. This is an irrigated country. Land with water is worth \$20 an acre.

YUMA COUNTY.—There is good opportunity for renting. There is plenty of vacant land, with water. As to purchase, there are good chances. Land is worth about \$25 an acre, with a water right.

UTAH.

(See table, p. 639.)

Farming in this State is carried on mostly on small farms, worked by the owners and their families. Few laborers are hired. Many of these small farmers are of foreign birth—English, German, Scandinavian, Swiss, and Dutch; and there are also some farm laborers of these nationalities. Italian truck farmers are found near Salt Lake City.¹

The representative farmers heard from seem to be pretty well agreed that there is little or no opportunity for foreign immigrants who do not speak English.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

WASHINGTON COUNTY.—There is but little, if any, opportunity for renting in this county and few opportunities for purchase on easy terms. (2) Chances for renting are limited. There is a fair opportunity for starting in independent farming for intelligent, active workers by locating on good upland.

GARFIELD COUNTY.—There are opportunities to rent on a variety of terms and good chances for starting independent farming.

WAYNE COUNTY.—Farms are rented on shares from year to year, rarely for any lengthened time.

SEVIER COUNTY.—There are no opportunities for renting here, but the chances for starting independent farming are fairly good.

SANPETE COUNTY.—There are no opportunities for renting and not very good chances for setting up in independent farming. A man would have better facilities in Oregon or Idaho. Some have gone to Idaho from here and others would go if they could sell for any reasonable figure.

MILLARD COUNTY.—There is very little chance to rent. Terms, on shares. There is little opportunity for starting in independent farming.

JUAB COUNTY.—There would be a few opportunities to rent. Each man usually does his own work. There would be no opportunity for starting in independent farming for a man without money.

CARBON COUNTY.—The chances for a poor man to establish himself in independent farming are good.

SALT LAKE COUNTY.—There are very few opportunities for renting in Salt Lake County, as many of our own children have to go to Idaho and Wyoming and other places.

WEBER COUNTY.—There are few opportunities for renting, and terms are about one-half the produce, with seed and team furnished. There are very good opportunities for purchase, however, on easy terms.

BOXELDER COUNTY.—Little opportunity for strangers to rent farms. If tenant furnishes team, tools, and seed he gets two-thirds of the crop. If all is furnished he gets one-third of the crop. The chances for an immigrant to establish himself in independent farming are not very encouraging. Old residents take all the opportunities.

WASHINGTON.

(See table, p. 641.)

The wonderful development of this State has been a work shared in by many foreign settlers. Reports from representative farmers on both sides of the Cascade Mountains show foreign farmers and farm laborers in every county heard from.

¹ See p. 503 of this report.

These are English, Irish, Scotch, Germans, Scandinavians, Finns, Russians, Italians, and French. The Russians are German-Russians, from the Valley of the Volga mainly. Many of these people are to be found in the Northwest. In one county heard from in this State German-Russians make up 25 to 30 per cent of the population. All of the farmers but one say that there are chances for newly arrived immigrants. Labor is scarce in the State and wages high. Mills and camps draw labor from the farms, so that farm labor is always in great demand.

The State is as yet sparsely settled. Population density is as yet only 7.7 to the square mile, and there is Government land to be had.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

Klickitat County.—Grain farms, giving one-third of grain at the thrasher, or one-half when owner furnishes seed and team. Good opportunities to purchase on payments while hiring out. Several have done so. Can take up land and chop and sell cord wood for a start.

Walla Walla County.—Good opportunities to rent, giving one-third of the crop. Good for purchase for man of energy and sound judgment.

Adams County.—Few opportunities for renting. Country is new and persons with means sufficient to own tenant's outfit can do better by taking up new lands for themselves. Easy to purchase. This section of the country has been settled under more adverse conditions than exist to-day.

Spokane County.—Good opportunities for either crop or cash rental. A man who wants to work and farm can do so if he will work at whatever comes up, such as cutting wood.

Douglas County.—Can rent land for one-third crop, tenant furnishing everything; owner furnishing teams and seed, one-half crop. Land is cheap, \$5 to \$8 an acre. Can be purchased while purchaser is hiring out if he is energetic.

Kittitas County.—Not very good opportunities for renting. Writer knows of no case where a man has purchased a farm while hiring out.

Clarke County.—Fairly good for tenancy at one-half crop. Fair for purchase.

Thurston County.—What are called "brush ranches" (partly cleared) can be had for a trifle over cost of taxes and repairs. Good farms on halves or at 3 to 5 per cent of value. As to purchase on easy terms, a man of energy and good sense, with a thrifty family, will soon own a good home clear.

OREGON.

(See table, p. 643.)

Oregon is less densely populated than Washington and is growing less rapidly; but representative farmers report good chances for immigrants. Many foreign farmers are settled in the State. From one neighborhood it is reported that about two-thirds of the farmers are Germans. This people seems to predominate; but there are also Scandinavians, Swiss, Dutch, English, Scotch, and Irish. Many of these, now independent farmers, started as very poor men.¹ There are also many foreign farm laborers, although one farmer states that most foreigners in his neighborhood are independent farmers. It is natural to suppose, where land is so cheap, that the foreign immigrant will try rather to work land of his own than hire out, or will hire out only until he has saved enough money to buy land.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

Douglas County.—Land can be rented for a grain or cash rent. Grain rent, one-third of the product; cash, about \$2.50 an acre. There are very favorable opportunities for purchase. A man can find a piece of vacant land and work out enough to make a living while improving and getting started with stock.

Marion County.—(1) There are good opportunities for renting. Tenant gives one-third of the grain received in the sack, he furnishing all of the seed and doing all of the work. Opportunities are not good for anyone paying for a farm unless he can make a payment of at least one-third down. (2) There are many farms to let. The tenant furnishes seed and team, giving one-third of the crop in bushel or hay in stack or barn, and gets house and garden free. There are many farms for sale on time payments, but one-fourth or one-third must be paid down. The purchaser

¹ See note 5, table.

can not depend on hiring out. In fruit neighborhoods a few men can get work with teams.

CLACKAMAS COUNTY.—In renting, if the tenant furnishes team and seed he gives one-third of the crop for rent; if the landlord furnishes everything the tenant pays one-half of the crop or its estimated cash value. As to purchasing land while hiring out, a great many do that. I did myself to begin with. I now have 300 acres adjoining the city of Portland.

YAMHILL COUNTY.—There are not many chances for renting at present. Well-known and good tenants can always get farms to rent at one-third of the crop in field or delivered. Any man of steady, decent habits who can and will work and knows how can always get a start as an independent farmer, as there is much cheap land awaiting improvement. If prices of crops were right, the owners would give a man a show to live. He ought not to come, however, without some ready money.

TILLAMOOK COUNTY.—There are good opportunities to become a tenant farmer at one-third of the crops as rent. As to purchasing land on payments while hiring out, this has not been done here; but I see no reason why a man endeavoring to do this would not have every opportunity now, as farm lands are for sale on time payments.

WASHINGTON COUNTY.—The supply of tenant farmers is small. When grain farming is practiced the owner receives one-third of the grain. Tenants on dairy farms receive one-half of the product and one-half of the increase in stock, the owner furnishing the cows and half of the feed. As to success in establishing one's self in independent farming, it all depends on management, as improved land within 20 miles of Portland is valued at from \$30 to \$50 an acre.

CALIFORNIA.

(See table, p. 645.)

Representative farmers from 4 southern and 5 northern counties speak of foreign farmers as found in all. There are, as everywhere, Germans and Swedes. There are also English, Scotch, Swiss, and Danes. Mexicans are mentioned in 1 southern county. Portuguese are found in 2 northern counties. In Alameda County (in which Alameda and Oakland are situated) the foreign farmers are mostly Portuguese. There are said to be 35,000 of them in the county. All are independent farmers and fruit growers.

Italians are noted in Santa Barbara County (southern) and Sonoma County (northern). It is said of the Italians in the former location that they select cheap lands on the canyons and foothills. In preceding pages of this report¹ will be found a full description of the wine-making colony of Italians in Sonoma County and an account of Italian agriculture in the State in general.

Farmers in the southern part of the State (see table, p. —) are evenly divided as to chances for immigrants; 2 think there are few or none, 2 think the chances good. Farmers in the northern counties, however, are almost unanimous in claiming that there is at present no room for immigrants.

Some interesting data from the Twelfth Census have been recently presented by advocates of irrigation that may indicate why immigrants are wanted in the south rather more than in the north. It was shown² from the census figures that while the State as a whole had increased 22.7 per cent during the last ten years, the thirteen coast counties had gained 25 per cent, the Sacramento Valley 4 per cent, the San Joaquin Valley 25½ per cent, the mountain districts 9 per cent, and the southern counties 47 per cent. The claim is made that agricultural development is at a standstill except in irrigated regions. The growth of the coast counties, such as it is, is attributed to the growth of cities. The Sacramento Valley, a large farming region, shows only 9 per cent increase, and the increase of the San Joaquin Valley, a fine agricultural region, is unsatisfactorily small. The mountain counties are largely mining and pastoral, which fact accounts for their slow growth. The only high rate of increase is in the seven southern counties, and in the four well-irrigated counties of Los Angeles, Orange, San Bernardino, and Riverside the gain is 67½ per cent.

On irrigated lands, in fruit farming and other sorts of farming, there would evidently be an opening for thrifty foreign farmers and laborers.

The Salvation Army has started a colony at Romie, Monterey County, in the valley of the Salinas, where they own 519 acres of land and have settled 70 colonists. For an account of their plans and methods and the connection of their colonization scheme with foreign immigrants see under "Colorado" in this report. This colony, like the one in Colorado, is situated in the neighborhood of a large sugar-beet factory. The land is irrigated. About \$30,000 has already been expended on improvements here.

¹ Page 500 following.

² Imperial Farmer, Los Angeles, Cal., Vol. I, No. 4, p. 3.

OPPORTUNITIES FOR TENANCY AND OWNERSHIP.

(Reported by representative farmers.)

SAN DIEGO COUNTY.—There are ranches for rent, but a man must understand the fruit business in order to succeed. Managers of ranches get \$40 a month. There is plenty of opportunity to purchase land on easy terms and payments.

RIVERSIDE COUNTY.—Many men now own valuable property who commenced with nothing a few years ago, by saving wages, paying on installments, and improving gradually while yet earning wages.

SAN BERNARDINO COUNTY.—Not very good opportunities for renting. Poor men of thrifty and industrious habits can establish themselves in independent farming.

VENTURA COUNTY.—(1) Opportunities for renting and purchase are very poor. (2) Opportunities for renting are not good, but opportunities for purchase are good.

SANTA BARBARA COUNTY.—Very few tenants. Farms are nearly all managed by the owners, whether the farms are large or small. As regards purchase, occasionally a small place can be found at a reasonable price, but all the best land is held at such a high figure that a man can not make the interest by daily labor on the farm.

STANISLAUS COUNTY.—Anyone knowing how to raise sweet potatoes or such crops can rent land with water, giving as rent one-fifth to one-seventh of the crop. Wheat tenants give one-third of the crop. There will be plenty of land for sale, at moderate prices, for several years here and in the adjacent Modesto district. Land here sells for \$30 to \$40 an acre; half down, usually.

ALAMEDA COUNTY.—There are few opportunities for renting land in this vicinity. It would not be advisable, although many small 4 to 10 acre places are ranches by Portuguese. Opportunities for purchase are good, for farmers can always find work away from their places in the orchards and fields. This is the way the Portuguese have filled up the country here.

SONOMA COUNTY.—Opportunities for renting are good, but no stated terms. Opportunities for purchase are good also.

ELDORADO COUNTY.—There is a little tenant farming done here. Considerable deeded land can be bought cheap and on the installment plan. As to living by hiring out, that is uncertain.

SHASTA COUNTY.—There are no opportunities for renting, and the chances for purchase are not good.

TABLE SHOWING CONDITIONS OF AGRICULTURAL LABOR AND DEMAND FOR IMMIGRANTS.

The matter in these tables referring to density and increase of population was compiled from the Twelfth Census: the remaining matter was compiled from replies received from representative farmers to a circular letter addressed to them. Each line in the tables represents the reply of one farmer. No attempt has been made either to average figures given or to harmonize their statements. The tables, then, can not be taken as giving a strictly statistical exhibit of the matters they deal with, but simply as giving a view of representative opinions in the localities named. The names in brackets following the names of counties in the tables are of the cities of 8,000 inhabitants or over which are situated in those counties.

MAINE.

[Density of population: 1890. 22.1; 1900. 23.2; increase, 5 per cent. Six counties, southwestern part of State.]

1 Without board.

2 Men.

3 Women and children.

4 Good men get steady work. remainder do not want steady work

5 Board and house furnished free to married. Garden and wood free in country.

6 And most of the time we are short of laborers.

7 A week.

8 Board, wood, and house furnished. Turpentine farms and sawmills pay \$1 a day and up.

FLORIDA—Continued.

Counties.	Changes in rate of wages, recent years.	Foreign farmers.	Nationality of farm laborers.	Nationality preferred as farm laborers.	Are there chances for im- migrants who do not speak English?
Polk	Increase.	Very few	Native whites, negroes.	Germans and Swedes wanted.	Yes: on farms and in phos- phate mines.
Hillaboro (Tampa)	No increase.	English, Swedes, Germans, Spanish.	Native whites, some foreigners.	No preference	Poor.
Palco	Decrease.	Germans, French, Russians, English.	English, Germans, negroes.		Yes; Germans.
Volusia	Expected increase.	Germans, Swedes, French, Irish.	Germans, Swedes.		No.
Putnam	Decrease.	Germans (a few).	Negroes mostly, native whites.	Whites	Germans might get along.
St. John	No increase.	None.	English, Germans	Negroes	Very few.
Alachua	Before orange freeze \$1 a day.	do	Negroes, native whites.	do	Not on farms, but in phos- phate or tur- pentine work.
Columbia	15 to 20 per cent increase.	Very few	Negroes, native whites (a few)		None.
Madison	No increase.	None	Negroes	Negroes	Yes; but they can not com- pete with ne- gro labor.
Gadsden	Increase.	Germans, Scotch.	do	do	A few at full wages.
Jackson	20 per cent increase.	None ⁴	do	do	None.
Calhoun	Increase.	Germans, Swedes	Few foreigners		
Walton	No increase.	Swedes	Negroes	White labor if could be had.	

¹ Owing to freeze of 6 years ago.

² The negro suits this section best because we do not have to provide houses or food for him. If there is no house convenient, he sleeps under a tree, works about half of his time, and is the happiest creature living.

³ Most new settlers re from southern States and make good citizens. We want more of this class. We do not want foreigners.

⁴ We could turn d locations for 25 to 50 families. Norwegians, Swedes, or Germans preferred.

CHAPTER XI.

IMMIGRATION LEGISLATION AND ITS WORKINGS.

A. THE ALIEN CONTRACT-LABOR LAW.

The Federal legislation restricting immigration is not a single consistent act of legislation, but it is a series of acts added one to another during the past 25 years. It is therefore ambiguous and conflicting at many points, since portions of the earlier laws, without being repealed, have been given a new construction by later laws. This makes the enforcement of the law often a difficult matter. The law, especially as applied to contract laborers, does not accomplish the ends expected by the public and the laboring classes of the country.

It is impossible to understand the weakness of the contract-labor law without understanding first that at the basis of the immigration laws there lies a curious contradiction. The earlier laws enacted by Congress—those of 1875 and 1882—were designed to exclude the vicious, the criminal, and the pauper, those who would not or could not support themselves. The next laws, the anti-contract labor laws of 1885, 1887, and 1888, practically sought to exclude those who had the forethought to provide that on landing here they would find a sure means of supporting themselves. The earlier laws exclude the worst, the later laws exclude the best. The consequence is that the immigrant must summon all his ingenuity and subterfuge to dodge the two extremes. He strives to show that he can support himself, and he strives to show that he does not know of any job by which he can support himself. If he can not support himself he is sent back as liable to become a public charge. If he has provided beforehand for self-support he is sent back as liable to displace American workmen. The immigration inspectors are therefore reduced to a queer predicament. They must discover, first, whether the immigrant is sound in body and mind—that is, whether he can compete successfully for a living with American workmen. If so, they admit him. They must discover, secondly, whether he really has a prospect of finding work, and thereby of competing with American workmen. If so, they exclude him. They exclude him if he can not or will not compete with American workmen, and they exclude him if he gives the best of all evidence that he will compete successfully with American workmen. On the face of the law the contradiction seems inexplicable. But if we look into its history and the conditions surrounding its adoption, we can see a sane explanation. The alien contract-labor law was enacted almost solely at the demand of organized labor. Organized labor meets its test at the critical point of a strike or a lockout. At such a crisis the issue turns solely on the ability of the employer to find workmen who will take the places of his former employees. While the unions may have fortified themselves by controlling the American labor market, they often saw themselves attacked in the rear and utterly routed by a block of immigrants suddenly imported by the employer from abroad or by his agent from Ellis Island. With wages in Europe only one-half or one-third of the corresponding grades in America a foreign solicitor would be overrun by applicants on the promise of prepaid transportation and immediate employment. To meet this unfair competition the labor unions, and especially the Knights of Labor, secured through Congress specific legislation known as the alien contract-labor law of 1885, with the amendments of 1886 and 1888. There had already been established by the Chinese exclusion act of 1882 a precedent for the exclusion of immigrants whose amazingly low standard of living and equally amazing industriousness had enabled them wholly to displace American workmen whenever they entered in competition. But in the case of the Chinese there were other considerations not found in dealing with European immigrants. The Chinese were of a distinct race and religion, unacquainted with representative institutions, not bringing their families, expecting to return to their native land, and while temporarily here resorting to low practices and filthy abodes. The excitement and determination of practically the entire population of the Pacific coast left no alternative except absolute exclusion. The case of the Europeans was not so unmitigated. The great majority at that time were coming from countries closely related to our own in ancestry, language, literature, religion, and representative government. Those countries were indeed the fatherland of America. It could not for a moment be considered that, against our own races coming from the lands of our origin, any sweeping exclusion could be adopted. Any restriction which could hope for adoption must be a specific protection against a definite recognized evil. This evil existed and came prominently to view. It was the artificial immigration induced by employers for the purpose of breaking labor organizations. Immigrants of our own race who came here on their own motive or on the representation of friends and relatives were especially exempted from the operation of the law. The first law, that of 1885,

applied only to those American employers who induced alien immigration. Section 1 reads as follows:

It shall be unlawful for any person, company, partnership, or corporation, in any manner whatsoever, to prepay the transportation, or in any way assist or encourage the importation or migration of any alien or aliens, any foreigner or foreigners, into the United States, its Territories, or the District of Columbia, under contract or agreement, partial or special, express or implied, made previous to the importation or migration of such alien or aliens, foreigner or foreigners, to perform labor or service of any kind in the United States, its Territories, or the District of Columbia.

Section 2 declared that such contracts should be "utterly void and of no effect."

Section 3 imposed a heavy fine upon the importer or solicitor of immigrants. It declared that—

every person, partnership, company, or corporation violating the provisions of section 1 shall forfeit and pay for every such offense the sum of one thousand dollars, which may be sued for and recovered by the United States or by any person who shall first bring his action therefor, including any such alien or foreigner who may be a party to any such contract or agreement, as debts of like amount are now recovered in the circuit courts of the United States, the proceeds to be paid into the Treasury of the United States; and separate suits may be brought for each alien or foreigner being a party to such contract or agreement aforesaid.

Section 5 imposed a fine of \$500 and imprisonment of six months on the master of any vessel who should knowingly bring to this country a prohibited alien contract laborer.

By an amendment adopted October 19, 1888, it was provided that the "Secretary of the Treasury (should) pay to an informer who furnishes original information that the law has been violated such a share of the penalties recovered as he may deem reasonable and just, not exceeding 50 per centum, where it appears that the recovery was had in consequence of the information thus furnished."

The law as enacted in 1885 was seriously defective. In the first place, it applied only to the importer of contract laborers and not to the immigrant. This defect was attempted to be amended in 1887 by a clause which, liberally interpreted, strikes also at contract laborers, and commanded that they should "be sent back to the nation to which they belong and from whence they came."

In so far as the law has been effective it has been due to this clause which gives power to deport the immigrants. Owing to the strict construction of the law there have been very few cases in which the importer was fined. But there have been over 8,000 deemed contract laborers sent back by the immigrant inspectors. The reasons for the difference are plain. The prosecution and conviction of the importer depends upon district attorneys and judges, who must necessarily follow the strict rules of evidence and must hold themselves to exact definitions of a contract. But the deportation of an immigrant turns upon the circumstantial evidence presented to administrative authorities and the inferences which may be drawn therefrom.

By the law of 1894 (which appeared as a section in the sundry civil appropriation act) the "decision of the appropriate immigration or customs officers," if adverse to the admission of an alien of the excluded classes "shall be final, unless reversed on appeal to the Secretary of the Treasury." Prior to the enactment of this law in 1894 the authority of the Secretary of the Treasury in ordering deportations was not specific. It was only implied in the amendment of 1887, above mentioned, prohibiting the landing of alien contract laborers. Upon the strength of this implied power the courts held that the action of Congress in giving discretionary power to an administrative officer is constitutional.

We have, then, two broad divisions to a discussion of the alien contract-labor law: First, the interpretation placed upon the law by the courts, affecting mainly the importer; second, the administration of the law by the Treasury Department, affecting mainly the exclusion and deportation of alleged contract laborers.

Preliminary to such a discussion we shall find it necessary to discover exactly the classes of aliens who, in the contemplation of the law, are to be excluded, and such other classes as are excepted and are therefore permitted to land and go to work, even though coming under contract.

B. EXCEPTED CLASSES OF ALIEN CONTRACT LABORERS.

In the first place, the courts have interpreted the terms of the laws so as to give to the importer of alien contract labor the benefit of every doubt. By this rule of interpretation the law is not to be construed literally.

The statute in question is highly penal, and must be so construed as to bring within its condemnation only those who are shown by the direct and positive averments in the declaration to be embraced within the terms of the law. It will not be so construed as to include cases which, although within the letter, are not within the spirit of the law. (*U. S. v. Gay*, 80 F., 254; 85 F., 227.)

Holding, as the courts have done in certain cases, to what they consider to be the spirit of the law even though contrary to its letter when the contract laborer is involved, and also holding in other cases to the letter of the law when the importer is concerned, we find that the original acts and amendments of Congress are subject to the following exceptions and exemptions:

1. **Aliens not immigrants.**—The general law on immigration applied in terms only to "alien immigrants," and consequently prior to 1894 the courts held that other classes of aliens who enter the country, not being immigrants, did not come under the excluding sections. As regards contract laborers, this covers the following classes:

(a) **CANADIANS.**—All persons who come across the border from Canada to perform daily labor and return at night, even though they be under contract. In *United States v. Michigan Central Railroad Company* (49 F., 365, Dec. 10, 1891) it was held by Justice Wallace that a clerk of the railroad company living in Canada but working in the company's office at Suspension Bridge "was not an immigrant because he did not come here intending to acquire a permanent or temporary home. As he did not migrate here the defendant did not encourage his 'migration.' He was not imported, nor did the defendant assist in his 'importation' any more than he was exported and assisted in his 'exportation,' when he went home at night."

While the court acknowledged the case in question might be "within the mischief which the promoters of the law intended to remedy," yet it held that it was "not within the ordinary import of the words of the statute."

It was to meet the alleged mischief occasioned by the foregoing interpretation of the law that the workmen in border towns, like Detroit and Suspension Bridge, secured the adoption by Congress of the so-called "Corliss Amendment," as attached to the "Lodge Immigration Bill" of the Fifty-fourth Congress, vetoed by President Cleveland. This amendment aimed to suppress all day labor by persons retaining their residence in a foreign country, whether under contract or not. The amendment was as follows:

SEC. 4. That it shall hereafter be unlawful for any male alien who has not in good faith made his declaration before the proper court of his intention to become a citizen of the United States to be employed on any public work of the United States, or to come regularly or habitually into the United States by land or water for the purpose of engaging in any mechanical trade or manual labor, for wages or salary, returning from time to time to a foreign country.

SEC. 5. That it shall be unlawful for any person, partnership, company, or corporation knowingly to employ any alien coming into the United States in violation of the next preceding section of this act: *Provided*, That the provisions of this act shall not apply to the employment of sailors, deck hands or other employees of vessels, or railroad train hands, such as conductors, engineers, brakemen, firemen, or baggage-men, whose duties require them to pass over the frontier to reach the termini of their runs, or to boatmen or guides on the lakes and rivers on the northern border of the United States.

SEC. 6. That any violation of the provisions of sections 4 and 5 of this act by any alien or citizen shall be deemed a misdemeanor, punishable by a fine not exceeding \$500, or by both such fine and imprisonment, in the discretion of the court: *Provided*, That all persons convicted of a violation of section 4 of this act shall be deported to the country from whence they came.

(b) **ALIEN RESIDENTS.**—The general immigration laws originally did not apply, as interpreted by the courts, to aliens already resident here, who temporarily depart and return. The terms of the law indicated "alien immigrants," and the courts held that aliens who had formerly resided in this country, though they were unnaturalized, were residents and not immigrants. (In *re Martorelli*, 63 F., 437, Oct. 13, 1894; in *re Maiola*, 67 F., 114, Feb. 2, 1895.)

The contract labor law forbids the assisting, encouraging, or soliciting the migration or importation of any alien, making the migration a necessary element on which to ground the deportation of the contract laborer and the penalty on the importer, so that an alien who has resided here did not come under the prohibition.

This defect of the law was amended by act of August 18, 1894 (28 Stat., 390), in so far as the deportation of an alien found to be of the excluded classes was concerned, by making the decision of the Secretary of the Treasury final in the case of all aliens and not merely alien immigrants, but this amendment probably does not affect the importer of alien laborers under contract who might continue to be exempt from penalty in case the imported alien were a former resident of the United States. This is on the assumption that the courts may continue to insist that the element of migration must still form the basis of the liability of the importer, "migration" being interpreted as the first migration to the country.

(c) **ALIEN SEAMEN.**—The master of a vessel is required by the act of 1891, section 10, to return to the country from whence he came any alien immigrants who have come to this country contrary to the prohibitions of the act. The court held in the case of an alien seaman who had deserted his ship in an American port that the inability of the master to secure his arrest and return to the ship exempted the master from the penalty of the act (*U. S., ex rel. Anderson v. Burke*, 99 F., 895). The court maintained that—

Immigration laws of the United States must be given a sensible construction having reference to their purpose, and as so construed they apply only to such aliens as enter or are brought to this country with the intention that they shall become residents thereof.

These laws have no application to alien seamen who constitute the bona fide crew of a vessel trading in the ports of the United States and who enter such ports with their ship in the discharge of the duties of their employment, and without any intention of becoming residents of the country, and the master of a vessel can not be subjected to the fine or refusal of his clearance papers provided by the act of March 3, 1891, as a penalty for refusing to return upon his vessel immigrants of the prohibited

applied only to those American employers who induced alien immigration. Section 1 reads as follows:

It shall be unlawful for any person, company, partnership, or corporation, in any manner whatsoever, to prepay the transportation, or in any way assist or encourage the importation or migration of any alien or aliens, any foreigner or foreigners, into the United States, its Territories, or the District of Columbia, under contract or agreement, partial or special, express or implied, made previous to the importation or migration of such alien or aliens, foreigner or foreigners, to perform labor or service of any kind in the United States, its Territories, or the District of Columbia.

Section 2 declared that such contracts should be "utterly void and of no effect."

Section 3 imposed a heavy fine upon the importer or solicitor of immigrants. It declared that—

every person, partnership, company, or corporation violating the provisions of section 1 shall forfeit and pay for every such offense the sum of one thousand dollars, which may be sued for and recovered by the United States or by any person who shall first bring his action therefor, including any such alien or foreigner who may be a party to any such contract or agreement, as debts of like amount are now recovered in the circuit courts of the United States, the proceeds to be paid into the Treasury of the United States; and separate suits may be brought for each alien or foreigner being a party to such contract or agreement aforesaid.

Section 5 imposed a fine of \$500 and imprisonment of six months on the master of any vessel who should knowingly bring to this country a prohibited alien contract laborer.

By an amendment adopted October 19, 1888, it was provided that the "Secretary of the Treasury (should) pay to an informer who furnishes original information that the law has been violated such a share of the penalties recovered as he may deem reasonable and just, not exceeding 50 per centum, where it appears that the recovery was had in consequence of the information thus furnished."

The law as enacted in 1885 was seriously defective. In the first place, it applied only to the importer of contract laborers and not to the immigrant. This defect was attempted to be amended in 1887 by a clause which, liberally interpreted, strikes also at contract laborers, and commanded that they should "be sent back to the nation to which they belong and from whence they came."

In so far as the law has been effective it has been due to this clause which gives power to deport the immigrants. Owing to the strict construction of the law there have been very few cases in which the importer was fined. But there have been over 8,000 deemed contract laborers sent back by the immigrant inspectors. The reasons for the difference are plain. The prosecution and conviction of the importer depends upon district attorneys and judges, who must necessarily follow the strict rules of evidence and must hold themselves to exact definitions of a contract. But the deportation of an immigrant turns upon the circumstantial evidence presented to administrative authorities and the inferences which may be drawn therefrom.

By the law of 1894 (which appeared as a section in the sundry civil appropriation act) the "decision of the appropriate immigration or customs officers," if adverse to the admission of an alien of the excluded classes "shall be final, unless reversed on appeal to the Secretary of the Treasury." Prior to the enactment of this law in 1894 the authority of the Secretary of the Treasury in ordering deportations was not specific. It was only implied in the amendment of 1887, above mentioned, prohibiting the landing of alien contract laborers. Upon the strength of this implied power the courts held that the action of Congress in giving discretionary power to an administrative officer is constitutional.

We have, then, two broad divisions to a discussion of the alien contract-labor law: First, the interpretation placed upon the law by the courts, affecting mainly the importer; second, the administration of the law by the Treasury Department, affecting mainly the exclusion and deportation of alleged contract laborers.

Preliminary to such a discussion we shall find it necessary to discover exactly the classes of aliens who, in the contemplation of the law, are to be excluded, and such other classes as are excepted and are therefore permitted to land and go to work, even though coming under contract.

B. EXCEPTED CLASSES OF ALIEN CONTRACT LABORERS.

In the first place, the courts have interpreted the terms of the laws so as to give to the importer of alien contract labor the benefit of every doubt. By this rule of interpretation the law is not to be construed literally.

The statute in question is highly penal, and must be so construed as to bring within its condemnation only those who are shown by the direct and positive averments in the declaration to be embraced within the terms of the law. It will not be so construed as to include cases which, although within the letter, are not within the spirit of the law. (*U. S. v. Gay*, 80 F., 254; 85 F., 227.)

Holding, as the courts have done in certain cases, to what they consider to be the spirit of the law even though contrary to its letter when the contract laborer is involved, and also holding in other cases to the letter of the law when the importer is concerned, we find that the original acts and amendments of Congress are subject to the following exceptions and exemptions:

members of Congress in debate to find reasons to control or modify the statute." (Cited *U. S. v. Railroad Co.* 91 U. S., 72.) Judge Wallace took this ground even though he admitted that—

it was no doubt primarily the object of the act to prohibit the introduction of assisted immigrants, brought here under contracts previously made by corporations and capitalists to prepay their passage and obtain their services at low wages for limited periods of time. It was a measure introduced and advocated by the trades unions and labor associations, designed to shield the interests represented by such organizations from the effects of the competition in the labor market of foreigners brought here under contracts, having a tendency to stimulate immigration and reduce the rates of wages. Except from the language of the statute there is no reason to suppose a contract like the present to be within the evils which the law was designed to suppress; and it would not be indulging a violent supposition to assume that no legislative body in this country would have advisedly enacted a law framed so as to cover a case like the present.

After laying down the rule above stated relative to the interpretation of the will of Congress, Judge Wallace continued:

The encouragement of migration prohibited by the first section is of aliens under contract or agreement previously made "to perform labor or service of any kind in the United States." The contracts which are declared to be void by the second section are contracts "having reference to the performance of labor or service by any person" in the United States previous to the migration of the alien. The penalty imposed by the third section is imposed on the person or corporation encouraging the migration of the alien under a contract or agreement previously made "to perform labor or service of any kind." No more comprehensive terms could have been employed to include every conceivable kind of labor or avocation, whether of the hand or brain, in the class of prohibited contracts; and as if to emphasize and make more explicit the intention that the words "labor or service" should not be taken in any restricted sense, they are followed by the words "of any kind." Every kind of industry and every employment, manual or intellectual, is embraced within the language used. If it were possible to import the narrower meaning than the natural and ordinary one to the language of these sections, the terms of the fifth section would forbid the attempt. That section has a proviso withdrawing from the operation of the act several classes of persons and contracts. Foreigners residing here temporarily who may engage private secretaries, persons desiring to establish a new industry not then existing in the United States who employ skilled workmen therein, domestic servants, and a limited professional class are thereby exempted from its provisions. The last clause of the proviso is: "Nor shall the provisions of this act apply to professional actors, artists, lecturers, or singers, nor to persons employed strictly as personal or domestic servants." If without this exception the act would apply to this class of persons, because such persons come here under contracts for labor or service, then clearly it must apply to ministers, lawyers, surgeons, architects, and all others who labor in any professional calling. Unless Congress expected the act to apply to the excepted classes, there was no necessity for the proviso. The office of a proviso is generally to restrain an enacting clause and to except something which would otherwise have been within it.

The decision of Judge Wallace, had it been sustained by the higher court, could have been remedied by Congressional action, and this was indeed intended to be done by the act adopted March 3, 1891, where it was provided that in addition to "artists, actors, lecturers," etc., the excluded contract laborers should not include "ministers of any religious denomination, nor persons belonging to any recognized profession, nor professors of college and seminaries."

Whether it is preferable to remedy a defective statute by legislative amendment or by judicial interpretation is a question of importance in the enforcement of the alien contract labor law. By successive decisions of the courts the operations of the law have been restricted until its efficiency has been almost extinguished.

The road for this line of judicial restriction was opened by the Supreme Court of the United States in reviewing the foregoing decision of Judge Wallace (148 U. S., 457). While conceding the strength of Judge Wallace's reasoning that the act of the Trinity corporation was "within the letter" of the law of 1885; that "not only are the general words 'labor and service' both used, but also, as it were, to guard against any narrow interpretation and emphasize a breadth of meaning, to them is added 'of any kind';" and that the "specific exceptions, among them the professional actors, artists, lecturers, singers, and domestic servants, strengthens the idea that every other kind of labor and service was intended to be reached by the first section;" yet the court laid down certain rules for interpretation which have made it possible for the courts in later decisions to greatly restrict the scope of the law.

First, the intention of the lawmakers: The Supreme Court held that "a thing may be within the letter of the statute and yet not within the statute, because not within its spirit, nor within the intention of its makers. * * * Frequently words of general meaning are used in a statute, words broad enough to include an act in question, and yet a consideration of the whole legislation or of the circumstances surrounding its enactment or of the absurd results which follow from giving such broad meaning to the words, makes it unreasonable to believe that the legislators intended to include the particular act."

In its effort to ascertain the intention of Congress the Supreme Court referred to the reports of the Senate and House Committees on Education and Labor recommending the passage of the bill. In the Senate report it was said (Congressional Record, Forty-eighth Congress, p. 6059):

The general facts and considerations which induce the committee to recommend the passage of this bill are set forth in the report of the committee of the House. The committee report the bill back without amendment, although there are certain features thereof which might well be changed or modified in the hope that the bill may not fall of passage during the present session. Especially would the committee have otherwise recommended amendments substituting for the expression "labor

and service" wherever it occurs in the body of the bill, the words "manual labor or manual service" as sufficiently broad to accomplish the purpose of the bill, and that such amendment would remove objections which a sharp and perhaps unfriendly criticism may urge to the proposed legislation. The committee, however, believe that the bill in its present form will be construed as including only those whose labor or service is manual in character, and being very desirous that the bill become a law before the adjournment, have reported the bill without change.

In the report of the committee of the House it was said (Congressional Record, Forty-eighth Congress, p. 5359):

It seeks to restrain and prohibit the immigration or importation of laborers who would never have seen our shores but for the inducements and allurements of the men whose only object is to obtain labor at the lowest possible rate, regardless of the social and material well being of our own citizens and regardless of the evil consequences which result to American laborers from such immigration. This class of immigrants care nothing about our institutions, and in many instances never even heard of them. They are men whose passage is paid by the importers. They come here under contract to labor for a certain number of years. They are ignorant of our social condition, and, that they may remain so, they are isolated and prevented from coming into contact with Americans. They are generally from the lowest social stratum, and live upon the coarsest food and in hovels of a character before unknown to the American workman. They, as a rule, do not become citizens and are certainly not a desirable acquisition to the body politic. The inevitable tendency of their presence among us is to degrade American labor and to remove it to the level of the imported pauper labor.

Another test which the court imposed was the circumstances surrounding the enactment of the statute, i. e., the evil which it was designed to remedy. Herein the court indorsed the statement of Justice Brown (U. S. v. Craig, 28 Fed. Rep., 795, 798), who said:

The evil here was "the practice of all large capitalists in this country to contract with their agents abroad for the shipment of great numbers of an ignorant and a servile class of foreign laborers under contracts, by which the employer agreed, on the one hand, to prepay their passage, while, upon the other, the laborers agreed to work after their arrival for a certain time at a low rate of wages. The effect of this was to break down the labor market and reduce other laborers engaged in like occupations to the level of the assisted immigrants, and to discountenance the migration of those who had not sufficient means in their own hands or those of their friends to pay their passage."

The Supreme Court also relied upon the title of the act of 1885, which reads: "An act to prohibit the importation and migration of foreigners and aliens under contract or agreement to perform labor in the United States, or Territories, and the District of Columbia."

The absurdity and inconsistency of enforcing the exclusion of ministers of the gospel under cover of a law designed to benefit American labor appealed strongly to the court. It said:

It appears also from the petitions and in the testimony presented before the committee of Congress that it was this cheap, unskilled labor which was making the trouble, and the influx of which Congress sought to prevent. It was never suggested that we had in this country a surplus of brain toilers, and, least of all, that the market for the service of Christian ministers was depressed by foreign competition. Those were matters to which the attention of Congress or of the people was not directed. So far, then, as the evil which was sought to be remedied interprets the statute, it also guides to an exclusion of this contract from the penalties of the act.

But beyond all these matters no purpose of action against religion can be imputed to any legislation, State or national, because this is a religious people.

SKILLED LABOR (d).—Unquestionably the most sweeping legal decisions affecting the scope of the alien contract labor law is that of United States v. Gay, first decided in the circuit court of the district of Indiana, April 30, 1897 (80 F., 254), and then on appeal in the circuit court of appeals, seventh circuit, June 6, 1899 (95 F., 226). These decisions, following the rule adopted in the Trinity Church case, of inquiry into the intentions of Congress in the discussion of the law, but going far beyond that case, affirmed that the intention of Congress was merely "to stay the influx of cheap, unskilled manual labor;" that Congress wished to shut out only "the cheaper, grosser sort of unskilled and unhusbanded manual labor;" that the law does not exclude either such professional classes as surgeons, architects, and physicians, or such skilled occupations as those of engineer, bookkeeper, stenographer, typewriter, clerk, saleswoman, draper, or window dresser;" and, indeed, that "Congress never intended to include in the act skilled labor of any kind."

The leading arguments of the appellate court are given herewith:

Several questions were discussed at the hearing, but there is only one that we think it necessary to consider. The opinion of the court below, printed in the record, shows that the principal ground on which the action was dismissed was that a draper, window dresser, and dry-goods clerk did not come within the prohibition of the statute. The court says in its opinion:

"The statute in question is highly penal and must be so construed as to bring within its condemnation only those who are shown by the direct and positive averments in the declaration to be embraced within the terms of the law. It will not be so construed as to include cases which, although within the letter, are not within the spirit of the law. It must be considered in the light of the evil which it was intended to remedy, which, as is well known, was the importation of manual laborers under contract previously entered into, at rates of wages with which our own laboring classes could not compete without compelling them to submit to conditions of life to which they were unaccustomed. (Citing authorities.) It is well settled by these and other cases that the statute must be construed as

limited to cases where an assisted immigrant was brought into the country under a contract to perform manual labor or service." (U. S. v. Gay, 80 F., 254.)

We are of the opinion that this ruling is correct, in view of the previous construction placed upon the statute by the Supreme Court in *Church of the Holy Trinity v. United States*.

Referring to the Trinity case the court continues:

The history of its passage through Congress is given, which shows clearly that Congress never intended to include in the act skilled labor of any kind. The conclusion of the court is that the title of the act, the evil which was intended to be remedied, the circumstances surrounding the appeal to Congress, the reports of the committees of the House and Senate, all concur in affirming that the intent of Congress was simply to stay the influx of cheap, unskilled labor.

Referring to the reports of the Senate and House committees, quoted above in the Trinity case, the court says:

These reports throw strong light upon the intention of Congress and the construction which they expected the courts to place upon the act, notwithstanding the very general terms "labor and service of any kind" employed in the act. To give the act a construction so strict as to include a minister of the gospel or other professional man would exclude any person employed in any calling or service requiring superior skill and intelligence, which would constitute a mischief quite as great as the one intended to be remedied by Congress. At the circuit in the same case Judge Wallace had felt compelled to follow the plain letter of the law and had given judgment for the plaintiff, especially in view of the exceptions which Congress had made of professional actors, artists, lecturers, singers, and persons employed as personal and domestic servants. The reasoning was this: That if, without this exception, the act would apply to this class of persons, because such persons come under contracts for labor or service, then clearly it must apply to ministers, lawyers, surgeons, and architects, and all others who labor in any professional calling. But for these exceptions and the plain language of the statute the circuit court would have reached the same conclusion as to the proper construction of the law as the Supreme Court did, as it says in the opinion:

"The act is entitled 'An act to prohibit the importation and migration of foreigners and aliens under contract to perform labor in the United States.' It was no doubt primarily the object of the act to prohibit the introduction of assisted immigrants, brought here under contracts previously made, by corporations and capitalists, to prepay their passage and obtain their services at low wages for limited periods of time. It was a measure introduced and advocated by the trades unions and labor associations, designed to shield the interests represented by such organizations from the effect of competition in the labor market of foreigners brought here under contracts, having a tendency to stimulate immigration and reduce the rates of wages. Except from the language of the statute, there is no reason to suppose a contract like the present to be within the evils which the law was designed to suppress; and, indeed, it would not be indulging a violent supposition to assume that no legislative body in this country would have advisedly enacted a law framed so as to cover a case like the present."

The statute was again before the Supreme Court, in *United States v. Laws* (165 U. S., 258, 16 Sup. Ct., 998), and the same liberal construction followed. In this case it was held that a contract made with an alien to come to this country as a chemist on a sugar plantation in Louisiana is not a contract to perform labor and service within the meaning of the act. It is shown by Mr. Justice Peckham, announcing the opinion in that case, that a similar construction had been adopted by the courts in New York in regard to statutes for claims of laborers. (See *Eriesson v. Brown*, 38 Barb., 390; *Aiken v. Watson*, 23 N. Y., 482; *Coffin v. Reynolds*, 37 N. Y., 640; *Wakefield v. Fargo*, 90 N. Y., 213.) If construed strictly the act would include every person employed to perform any sort of labor or service except those among the exempted class by Congress. It would include lecturers, lawyers, physicians, surgeons, architects, engineers, bookkeepers, stenographers, typewriters, clerks, salesmen, drapers, and window dressers. But when we once break away from the letter of the law and seek for its true meaning and intent, which was to stay the influx of cheap, unskilled manual labor, then the liberal construction adopted by the Supreme Court furnishes the only safe resting place. Under such a construction it seems quite clear that the employment of a single person to come to this country and engage for a dry-goods house as a draper, window dresser, and clerk does not come within the true intent and meaning of the prohibition. There was no such mischief as that ever complained of, and none such to be remedied. It is not that cheap, uncultivated, unintelligent labor from competition with which our institutions stood in danger. The main purpose of the law, no doubt, was to prevent great corporations and business firms from contracting abroad for common, cheap, unskilled laborers to work in our mines, our mills, our factories, in our lumber woods, in grading canals and railroads, and to work upon other public improvements where a great many manual laborers are required. The practice of employing such laborers and importing them to this country and paying their passage under contracts to work for a stated time at low rates of wages, with which our better-fed and better-housed workmen could not compete, was the mischief Congress had in mind. A silk draper or linen draper is not a common laborer. He may do work with his hands, as does a minister, a lawyer, a surgeon, but to designate him as a common manual laborer would be a misuse of the English language. The habit of working with the hands is not by any means the criterion. All men work with their hands. But in some occupations, like that of working with the spade or shovel or wheelbarrow, or as a common hand in a sawmill, or in the lumber woods with a peavey or crowsaw, the value of the labor consists principally in the physical results.

The surgeon also works with his hands, but the beneficial results in his case come from the skilled labor of the mind, guided by much study and experience in connection with that of the hand. The stenographer or typewriter works constantly with the hands, and yet the value of his work does not consist mainly in the manual labor done, and it would be a misuse of terms to call him a laborer. He is not such in the ordinary acceptation of the term, no more than is a draper or window dresser. The need of window dressers in large commercial centers like New York to dress out window fronts for the artistic display of silks and woollens is very well known. It has become a favorite way of advertising, and the tradesman who can present the most attractive window is apt to get the best trade. The occupation does not necessarily require any manual labor at all, as that may be done under the direction and superintendence of the one skilled in that trade or business. It evidently requires experience, with good taste and judgment. He must know the value of perspective, and must be able to arrange and combine light and shade and colors to the best advantage, something as an artist does in a painting. To do this with proper effect requires something more than muscle and a spinal cord. It calls for intelligent skill. So with a skillful salesman of silks and woollens, a mercer, or draper, though he performs the labor of his hands to a certain extent, the principal value of his services comes from a different and more occult source. He must know his wares thoroughly and the best manner of exhibiting them, and have some knowledge and experience in the treatment and management of

customers. It was not service of this kind that Congress sought to shut out, but the cheaper, grosser sort of unskilled and unhouse manual labor which was coming from abroad in competition with the common labor in this country, which has ever been on a somewhat higher plane, and where it was the purpose of Congress in the enactment of the law to keep it. Countenance is lent to this construction also by the act of Congress amending the law passed February 23, 1887 (24 Stat., 414, c. 220). Section 8 of this act provides that all persons included in the prohibition of the act shall be sent back to the nations to which they belong and from whence they came. It would be absurd to suppose that Congress intended that persons employed in trade or in any business requiring intelligence and skill, or, indeed any except those from the lowest social stratum engaged in unintelligent and unskilled labor, should be sent back to the nations from whence they came. It has always been the policy of Congress, as well as the States, to encourage immigration of the better and more intelligent classes. To prohibit the introduction of these was not the purpose of Congress in the enactment of the present law.

(e) NEW INDUSTRIES.—An important exemption from the operation of the law is that of "skilled workmen" imported under contract "to perform labor in the United States in or upon any new industry not at present established in the United States: *Provided*, That skilled labor for that purpose can not be obtained otherwise."

Here are two conditions which in conjunction permit a skilled laborer to be imported under contract, namely, a new industry and the absence of skilled labor for that purpose in the United States. Both conditions are ambiguous. Does the first one mean "not established in 1885, the year when the law was enacted," or does it mean "not established at the time of the importation of the immigrant?" If it means the former, then any industry not established before 1885 would be open to alien contract laborers. If it means the latter, then "how far advanced must an industry be before it is established?" If the object of the alien contract-labor law is to maintain a high standard of wages in the United States through excluding aliens, and if the securing of skilled laborers is only a question of paying high enough wages, "how high must wages be advanced before it can be said that skilled labor can not be obtained?"

Upon the latter point, an early case was decided against the importer on the ground that he had not used "reasonable efforts to discover or to train workmen competent to do the desired work." (*U. S. v. McCallum*, 44 F., 745, Jan. 16, 1891.)

In this case it was decided that the industry in question was a "new" one, not because the kind of article manufactured—"French silk stockings"—had not been successfully produced in this country, but because the particular article, on the particular kind of machine, had not been manufactured. This definition of a "new industry" has been followed in other judicial cases and by the Secretary of the Treasury in the recent Dowie cases.

In the "lace curtain case," decided in 1893 (*U. S. v. Bromiley*, 58 F., 554, Nov. 23, 1893), the court held that prior to 1890 there was no evidence of any manufactory of fine lace in this country, except one establishment at Wilkesbarre, and that since 1890 there had been some eight or ten establishments manufacturing fine lace curtains, as a result of the McKinley tariff law of 1890. The court said:

I have no hesitancy in saying to you that in 1890, 1891, and 1892 it was a new industry. How successful it has been we do not know. It was a new industry, not established, and, according to the testimony, is not established at this date. * * * Even the witnesses called by the Government tell you that skilled menders, such as the defendant required and imported from England, could not have been employed in this country, unless, to use the expressive terms of the witness, they were "stolen from other mills."

The last clause just quoted indicates the second ambiguity above referred to, namely, the absence of skilled labor in the United States. The only way in which employees could be "stolen from other mills" would be through the payment of sufficiently high wages. And while to the employer this might seem like theft, yet to the workmen it would be the very fulfillment of the alien contract-labor law.

As a matter of fact both the courts and the Bureau of Immigration decide the issues solely on the question whether skilled labor can be found in the United States competent for the work desired. They pay little or no attention to the question whether the industry is a new one or an old one. (See "*Dowie*" case cited below, p. 668.)

(f) PROFESSIONAL ACTORS, ARTISTS, LECTURERS, AND SINGERS.—In a decision rendered by Justice Lacombe in 1899, prior to the decision of the Supreme Court in the Trinity case, the strict interpretation of the statute was insisted upon, and a penalty of \$1,000 was imposed upon the importer of a milliner from Paris, notwithstanding the plea that a "milliner" is a "professional artist." (*U. S. v. Thompson*, 41 F., 28, Nov. 26, 1889.) The judge said:

It is well settled by authority that the popular and received import of words furnishes the general rule for the interpretation of public laws. Under this rule the defendant's contention is not sound. Milliners, dressmakers, tailors, cooks, and barbers (some of them no doubt call themselves "artists") are not "artists" within the popular and received import of that word. In the excepting clause or proviso, therefore, there is nothing to relieve the defendant from the operation of this statute.

It will be inferred from later cases cited above that the rule excluding a milliner would probably not at the present time be sustained.

The question as to whether musicians are artists was decided by the Assistant Secretary of the Treasury in the case of the Straus orchestra in New York by a definition of the word artist.

As the accepted definition of the word artists includes musicians who combine science and taste in the manual execution of their art, such musicians of the Straus orchestra may be admitted as artists under the proviso of section 5 as by their skill, taste, and accomplishments as musicians evidently come within the definition. This is not to be interpreted that any combination of musicians would be admitted as artists. (Syn. Dec., 10429.)

(9) **RECOGNIZED PROFESSIONS.**—The amendment of March 3, 1891, while adding ministers and college professors to the list of exempted classes who are eligible for admission, even though coming under contract, also added the clause "persons belonging to any recognized profession." Under this exception chemists are admitted. In *United States v. Laws* (163 U. S., 258, May 18, 1896) it was held that a contract made with an alien in a foreign country to come to the United States as a chemist on a sugar plantation in Louisiana, in pursuance of which contract said alien did come to this country and was employed on the sugar plantation, his expenses being paid by the defendant, was not a contract to perform labor or service prohibited under the contract-labor law. The same, after adverting to the general purposes of the act as not to embrace skilled labor, called attention to the fact that by the amendment of 1891 persons belonging to any recognized profession were excepted from its provisions, and said:

We think a chemist would be included in that class. Although the study of chemistry is the study of a science, yet a chemist who occupies himself in the practical use of his knowledge of chemistry as his services may be demanded may certainly at this time be fairly regarded as in the practice of a profession. * * * The fact that the individual in question by this contract had agreed to sell his time, labor, and skill to one employer and in one prescribed branch of the science does not in the least militate against his being a professional chemist, nor does it follow as a bar to the claim that while so employed he is nevertheless practicing a recognized profession.

C. PROSECUTION OF THE IMPORTER.

In considering the enforcement of the law excluding alien contract laborers, there must be kept in mind clearly the distinction already noticed between the penalty imposed upon the importer and the penalty imposed upon the immigrant. The penalty upon the importer is imposed by the Federal courts, with an appeal to the Supreme Court of the United States. The penalty upon the immigrant is imposed by the immigration inspectors, with an appeal to the Secretary of the Treasury. We shall consider first the penalty imposed upon the importer. As stated above, the original law of 1885 applied only to the importer of aliens under contract to perform labor. The penalty section is as follows (sec. 3, act of 1885):

That for every violation of any of the provisions of section one of this act the person, partnership, company, or corporation violating the same, shall forfeit and pay for every such offense the sum of one thousand dollars, which may be sued for and recovered by the United States or by any person who shall first bring his action therefor, including any such alien or foreigner who may be a party to any such contract or agreement, as debts of like amount are now recovered in the circuit courts of the United States; the proceeds to be paid into the Treasury of the United States; and separate suits may be brought for each alien or foreigner being a party to such contract or agreement aforesaid.

1. **The proofs of the contract.**—The Supreme Court holds, in the first place, that the action to recover a penalty, herein provided for, though it is in the form of a civil contract, is unquestionably criminal in its nature, and the defendant—the importer—can not be compelled to be a witness against himself. (*Lees v. U. S.*, 150 U. S., 476.) The same ground has always been held by the lower courts. In *United States v. Mexican National Railway Company* (F. 40, 769), the court said:

It is useless to enter upon a critical analysis of the act of February 26, 1885, to demonstrate that the suits thereby authorized are not suits of a civil nature. Suffice it to say that the statute denounces the prohibited act of importation, etc., as an offense; the penalty attached to its commission is the forfeiture of \$1,000, and the proceeds are paid into the Treasury, less such share of the penalties, under the amendment of October 19, 1888, as the Secretary of the Treasury may, in his discretion, pay to the informer. It is apparent that the forfeiture does not arise from any contractual relation between the Government and the offender. It does not accrue from the violation of a private right, but grows out of the commission of an offense against the public. That the mere form of the action is civil is regarded as immaterial, as the courts look beyond that to inquire into the nature of the suit.

Since the importer can not be compelled to be a witness against himself, the prosecution must generally depend for witnesses upon residents of foreign countries, who either were present at the making of the contract in a foreign land, or who could give circumstantial evidence of the contract, or it must depend upon the immigrant himself. The court holds that, according to the terms of the law, the contract or agreement must have been made "previous to the importation or migration." Consequently the only contract that is contemplated is one made in a foreign country outside the jurisdiction of the United States courts. This being the case, the witnesses to the contract continue to be in most cases residents of the foreign country and can not be secured. If they do come to this country it is because they also are immigrants and associates of the alleged contract laborer, and are equally interested with him in concealing the fact of the contract. Consequently, it follows that the only witness to the contract on whom the Government prosecution can usually depend, is the alleged contract laborer himself.

But this witness knows that by confessing the contract he will be punished by deportation, and this threat of deportation is enough to make him conceal the fact that the contract exists. As a matter of experience, it has been found that the circumstance under which an imported laborer can be secured as a witness is usually that when he has had a falling out with his employer, the importer, and thinks that he may be able then both to get revenge and to win the informer's share of 50 per cent of the penalty recovered from the importer.

2. *Elements of violation of the alien contract labor law.*—While the courts have held to a liberal construction of the law as related to the exempted classes who may be admitted, they have held to a strict construction of the terms of the contract.

In one of the earliest decisions (*U. S. v. Craig*, 24 F. 795, Oct. 11, 1886), which has been followed by all subsequent decisions, the court said:

To give the right of action under this section, three things are essential: (1) The immigrant must first, previous to his becoming a resident of the United States, have entered into a contract to perform labor or service here; (2) he must have actually emigrated to enter into the United States in pursuance of such contract; (3) the defendant must have prepaid his passage, or otherwise assisted, encouraged, or solicited his migration, knowing that he had entered into this illegal contract.

(a) *TIME AND COMPENSATION.*—The first of the foregoing essentials named by the court covers the term of the contract. On this point the courts adhere strictly to the rule that a contract to be complete and enforceable, while it may be express or implied, written or parol, must in any case contain the elements of time and compensation—i. e., it must specify the period of time during which the proposed employment is to continue, and must specify the amount of wages to be paid. Says the court in another case (*U. S. v. Edgar*, 45 F., 44, Jan. 29, 1891):

It is not unlawful "to prepay the transportation" of an alien, unless at the time of such prepayment the alien is then "under contract or agreement to perform labor or service in the United States."

* * A contract that is not enforceable for the reason that it lacks some of the elements of a valid agreement, such as "mutual assent" or a consideration is not a contract. The words "contract or agreement" as used in the statute must be held to mean a complete contract; that is to say, an agreement entered into for a sufficient consideration to perform some kind of labor or service, the terms of which the parties have mutually assented. If an "implied contract" is counted upon, a state of facts must be alleged from which a court or jury might lawfully draw the inference, as a matter of fact, that the alien had agreed to perform labor or service of some kind and that some other person had agreed to accept such service.

In this case the court held that the letters exchanged between the two parties did not constitute an "express contract," and were insufficient to establish an implied contract, because they omitted to stipulate the amount of compensation to be paid, and the time during which employment was to continue. The letters referred to are as follows:

No. 16 AIKEN STREET,
Barton Hill, Bristol, April 11, 1890.

MR. GRAY, Manager.

DEAR SIR: I have heard that you are in want of men to work on the spelter furnaces. I and one of my fellow workmen would like to come out there as the works here is very slack. If it would be convenient for you to send us a pass each we would come out as soon as possible. We have both worked in the spelter works for many years. Would you oblige us by writing back to let us know, and oblige,

I. BOYCE,
No. 16 Aiken Street, Bristol, England.

The name of my fellow workman, Fred Dorosalski.

[S. C. Edgar, lessee Glendale Zinc Works, manufacturers and refiners of spelter.]
SOUTH ST. LOUIS, July 1, 1890.

I. BOYCE,
No. 16 Aiken Street, Barton Hill, Bristol, England.

DEAR SIR: Your letter of April 11 has just been handed me, and I have this day bought two tickets for you and Fred Dorosalski from St. Louis agent of American Line, and all you have to do is to take this letter to Richardson, Spence & Co., No. 17 Water street, Liverpool, and get tickets through to St. Louis. We can give you steady work, and a place for six or eight more smelters, if they want to come. I run fourteen Belgium furnaces. The tickets will not be good after July 18.

Yours, truly,

S. C. EDGAR.

This case was appealed from the eastern judicial district of Missouri to the circuit court of appeals (*U. S. v. Edgar*, 4 U. S. App., 41), which affirmed the judgment of the lower court for the defendant.

The significance of the strict interpretation of the contract is plainly seen in this case, wherein the counsel for the Government had contended that in construing a measure of public policy we ought not to be critical about the term of the contract for labor mentioned in the contract if there is reason to believe that the act complained of is in violation of the spirit, if not the letter of the law. The court replied:

We are not disposed to declare what shall be a sufficient contract under the law. The difficulty in supporting the complaint is, that there does not appear to have been any contract or agreement whatever between defendant and the Englishmen "made previous to importation or migration of such alien or aliens, foreigner or foreigners." The letter written by one of the Englishmen, and defend-

ant's answer, did not make a contract or agreement of any kind until something further should be done.

The act of the Englishmen in getting the tickets at Liverpool, and coming to Philadelphia, was necessary to complete the contract or agreement such as it was. In other words, when the defendant prepaid the Englishmen's passage, and thus assisted and encouraged them to come to the United States, there was no contract for labor which had been previously made by them; and so the case is not within the statute.

The foregoing decision makes quite plain the great difficulty imposed upon the Government in securing a conviction under the law, as long as the statute conditions the conviction upon the existence of an enforceable contract.

(b) ACTUAL MIGRATION.—The second essential element in violation of the labor contract law as laid down by the court in *United States v. Craig*, noted above, is "actual migration to the United States in pursuance to such contract."

Here arises a contradiction in the law. The courts have held from the time of the first cases on the subject, that, in order to make the contract binding, the immigrant must have actually entered into the United States in pursuance of such contract. "Admitting," says the court (*U. S. v. Craig*, 28 F., 795, decided Oct. 11, 1886), "that the words 'encouraging and soliciting' would seem to indicate an offense in itself, the word 'assisting' in the same connection implies that the immigration shall actually take place before the defendant can be held liable, for a person can not assist in doing that which is never done. In such case the person assisting or advising the immigration could no more be convicted than an accessory before the fact could be, if the crime advised were never committed."

This decision and the others which follow it require that the contract immigrant shall actually have landed, i. e., shall have completed the act of immigration before the contract can be enforced upon the importer. Otherwise the alleged assistance and promise of work given by the person in the United States is only an offer, and the proposition of the laborer is only an offer to come to the United States. There is no contract to employ or be employed.

Now other sections of the law prohibit the landing of contract laborers. Section 6, added to the law in 1887, says:

If in such examination made by immigration inspectors there shall be found among such passengers any person included in the prohibition in this act, they shall report the same in writing to the collector of the port, and such person shall not be permitted to land.

Also section 8 of the act of March 3, 1891, provides that inspection offices, where it is inconvenient to examine aliens on board incoming vessels,

may offer a temporary removal of such aliens for examination at a designated time and place, and then and there detain them until a thorough inspection is made. But such removal shall not be considered a landing during the pending of such examination.

Section 10 provides that—

All aliens who may unlawfully come to the United States shall, if practicable, be immediately sent back on the vessel by which they were brought in.

It is plain that these provisions require the immigration officials not only to send back their only witnesses to the contract but, also, as held by the courts, to prevent the completion of the illegal contract itself. If the immigrant who comes on an illegal contract escapes the vigilance of the inspectors and goes to work for the importer there is of course no punishment because the crime is not detected. But, on the other hand, if the inspectors discover the attempt to commit the crime they are required to step in and save the criminal from completing the last link in his offense. It is as though the law should declare that a man is not a thief who has been discovered by the policeman after he had broken into a house but just before he had actually laid his hands on his intended booty. Technically he is not a thief because he has not stolen anything. The law, therefore, to meet his case, does not charge him with theft but with the crime of burglary. A similar correction is needed in the alien contract labor law if it is to catch the importer.

It has been suggested that this defect of the law could be remedied by making it plain that "encouraging" or "soliciting" immigration is to be considered an offense in itself, apart from the existence of a contract. (Reports of the Industrial Commission, Vol. XV, Ullo, 143.) Judge Brown, in the *Craig* case, cited above, seems to suggest this view.

(c) ASSISTANCE AND SOLICITATION.—The third element essential to convict the importer is that, knowing the existence of the illegal contract, he should have prepaid the passage or otherwise assisted, encouraged, or solicited the migration of the alien. The contract is not the cause of action, and indeed the defendant need not necessarily have been a party to it. (*U. S. v. Craig*, 28 F., 795.) But if he assisted or solicited the immigration "in any manner whatsoever," knowing the contract to have been entered upon, he is liable. The law of 1891, which permits a person

to prepay the passage of a relative or friend, does not allow such relative or friend to come here under contract, but on the contrary requires that it should be affirmatively and satisfactorily shown that he is not under contract. At the same time, the making of a contract with an alien and his migration into the United States to perform it may of itself be an assistance and solicitation of the employer punishable under the contract-labor law.

In the act of 1891 (§ 3) it is expressly provided that advertisements printed and published in a foreign country promising employment to aliens who may come to the United States shall be deemed a violation of the act of 1885. In this case the actual migration of the alien need not have taken place. The advertisement itself is a violation of the law. The rule herein is different from that which applies to a contract, where, in addition to the contract, there must be actual migration.

D. DEPORTATION OF CONTRACT LABORERS—THE AUTHORITY OF THE TREASURY DEPARTMENT.

Having considered in the foregoing pages the difficulty of securing the conviction of the importer of contract labor, we have now come to consider the other side of the enforcement of the law, namely, the deportation of the immigrant himself.

The law of 1885, it will be remembered, applied solely to the importer. It was not until the act of February 3, 1887, that the immigrant of the excluded classes was prohibited from landing, and was required to be sent back to the nation to which he belonged and from whence he came.

In the act of October 19, 1888, the Secretary of the Treasury was authorized to deport the contract laborer at any time within a year after he had landed.

Again, in the act of 1893 the immigrant was required to state before embarkation whether he was under contract to perform labor in the United States. (Act of March 3, 1893, § 1.)

The question as to whether the authority of the Secretary of the Treasury in deporting immigrants was final in all cases or not was at first decided differently by different Federal judges. It was admitted that "final determination of those facts may be intrusted by Congress to executive officers, and in such a case in which the statute gives a discretionary power to an officer, to be exercised by him upon his own opinion of certain facts, he is made the sole and exclusive judge of the existence of those facts, and no other tribunal, unless expressly authorized by law to do so, is at liberty to reexamine or controvert the sufficiency of the evidence on which he acted." (142 U. S., 690.)

Yet notwithstanding the immigration officials have power to exclude or deport aliens who come within the definition of the excluded classes, the lower courts held, prior to 1894, that they had power to inquire into the fact whether the alien was an immigrant or a resident. If the latter, he did not come under the excluded classes. The discretion of the Secretary, it was held, pertained only to those aliens who were actual immigrants, and who had not previously resided in the country. The judges held that they are immigrants the first time they land, and after the first landing they are no longer immigrants, and are beyond the jurisdiction of the Bureau of Immigration. (In re Howard, 63 F., 263; in re Panzara, 51 F., 275; in re Martorelli, 63 F., 437; in re Maiola, 67 F., 114.)

This defect in the law was remedied in 1894 by the clause already mentioned in the civil appropriation act (28 Stats., p. 390), which made the decisions of the inspectors and Secretary final in the case of all aliens, and not making any distinction between alien immigrants and alien residents. Since that time the courts have recognized that all aliens are within the jurisdiction of the immigration bureau. The decisions fully sustain the right of the immigration officials to decide for the exclusion and deportation of immigrants whom they believe to be contract laborers. There is no appeal to the courts. The only appeal is to the Secretary of the Treasury, an executive official. The court, on habeas corpus proceedings in case of a contract laborer refused permit to land, will not review the action of the immigration official, on the ground that the Secretary of the Treasury is the person who is solely charged with the duty of executing the provisions of the immigration laws, and consequently his decision is final. The court, for the same reason, will also refuse on writ of habeas corpus to review a case of a deportation made within one year after immigration, as provided in the amendment of October 19, 1888, giving authority to the Secretary of the Treasury to arrest and deport aliens illegally landed under the immigration laws within one year. (In re Liferi, 52 F., 293, July 29, 1892.) The opinion in this case dismissed the writ of habeas corpus, and refused to review the action of the Secretary in deporting the immigrant whose violation of the law was only discovered a few days after he landed.

This recognition of executive discretion goes so far that the courts will refuse to interfere even when they see what they consider serious injustice is being done. In the case of *Ota* (96 F., 487) the court said:

It appears very clearly from these facts that *Ota* is not an alien immigrant, and the Commissioner of Immigration and the Secretary of the Treasury, if the same facts were laid before these officers, erred in ordering him to be returned to Japan as such. But, the court continued, under this statute (Aug. 18, 1894, 28 Stats., 390), when the executive officers of the Government upon a hearing such as is contemplated by the law have decided that an alien is not entitled to enter the United States, the courts are without jurisdiction to review that determination upon questions either of law or of fact.

In another case the court said that the decision of the Secretary of the Treasury can not be reviewed by courts even though in plain disregard of the statute. (In *re Lee Ping*, 678; in *re Tun Law*.)

Another decision affirms that "the statute does not require inspectors to take any testimony at all and allows them to decide on their own inspection and examination the question of the right of any alien immigrant to land." The court is without jurisdiction to discharge upon writ of habeas corpus where the collector undertakes to deport a petitioner without a hearing or pending a hearing." (In *re Lee Lung*, 102 F., 132, May 12, 1900.) Referring to the opinion in 100 F., 389, that "the power of the court might be properly exerted in such a case to arrest the consequence of the collector's illegal act, but that it could go no further," the court says:

It is not clear as to what is meant by jurisdiction of the courts to "arrest the consequence of the collector's illegal act." If the court is without jurisdiction to inquire, upon writ of habeas corpus, as to the legality of the petitioner's detention, under such circumstances it is without any jurisdiction whatever in the premises. So far as I am advised there is no power in the courts to control the action of the collector of customs, as suggested.

The case established the doctrine that "the collector of customs in determining the right of Chinese persons to land may act upon his own information and discretion, and that such action, however taken, is conclusive of the matter, subject to the right of appeal to the Secretary of the Treasury. That this decision, if he decided not to hear testimony or not to give effect to evidence, which the laws of Congress have provided, shall be sufficient to establish the right of landing in the first instance, or decides not to decide, is conclusive. Under the doctrines of this case it is immaterial, so far as the jurisdiction of this court is concerned, whether the petitioner appealing to the Secretary of the Treasury is heard by the Secretary in person or by a subordinate official in his Department or is heard at all."

It must be remembered, as already stated, that the decision of the Secretary of the Treasury in ordering a deportation is not binding upon the courts in the prosecution of an importer or the steamship company. In *United States v. Burke* (99 F., 895), it was held that the master of a ship from which a sailor had escaped in an American port should be relieved from the penalty imposed by the collector of customs, because the sailor in question was not an immigrant in the contemplation of the law. In a case of that kind the court held that—

The provisions of the act of August 18, 1894, making the decision of the appropriate immigrant or customs officer excluding an alien from admission to the United States under any law or treaty conclusive upon the courts, does not preclude a court from entertaining jurisdiction to determine the question whether such alien was in fact an immigrant within the meaning of such laws.

It should be added to the foregoing that a contract laborer once deported may, nevertheless, return to the United States without a contract, or even with another contract, provided the latter comes under the excepted classes, as, for example, a "personal or domestic servant." But should his work be supplemented by working at the occupation in which the former contract was alleged, he can, upon satisfactory evidence, be arrested and deported. (Syn. Dec. 17893.)

E. THE BUREAU OF IMMIGRATION.

1. *Legislation.*—It will be understood, of course, that the law of 1894 and the decisions thereunder place a large discretion in the hands of the Treasury Department, operating through the Bureau of Immigration. We have to do, here, with both the interpretation of the law by the Department and the administrative machinery of inspection.

The Department, in its interpretation, is, in effect, not bound by the precedents established by the courts. Undoubtedly it was the main object of this amendment to take the matter of enforcing the contract labor law, as far as possible, out of the strict interpretation of the courts and to place it under the informal decisions of officers, who might be able to act upon their impressions and convictions, and to take into account collateral indications not admissible in courts. This may appear to be an undemocratic grant of arbitrary power, in that a large class of people is placed under the pleasure of executive officers without protection in the courts.

This undoubtedly is true, unless within the administrative machinery of the Department is provided an effective substitute for a judicial investigation. Such an attempt has been made, but has not as yet been perfected, as will be shown below.

Acting under the power to inspect and deport immigrants the Secretary of the Treasury was authorized by the act of 1887 to enter into contract with State commissions in any State for the enforcement of the law under rules prescribed by himself. He was also given power to appoint contract-labor inspectors, whose duty it should be to attend to execution of the law of 1885 and 1887. It was not until 1891 that the complete enforcement of the law was taken out of the hands of the State commissioners at the port of New York and the other leading ports and placed under the control of commissioners appointed directly by the Secretary of the Treasury. This authority was included under section 8 of the act of 1891, in these words:

All duties imposed and powers conferred by the second section of the act of August 3, 1882, upon State commissioners, boards, or officers acting under contract with the Secretary of the Treasury shall be performed and exercised as occasion may arise by the inspection officials of the United States.

The law of 1893, from the standpoint of administration, is the most important legislation on this subject. It was the first to provide for the inspection of immigrants abroad before embarkation. This law requires that the steamship companies shall deliver to the inspector of immigration a list or manifest made out at the place of embarkation of all alien immigrants on board said steamer. These manifests are made in groups of 30 immigrants; the manifest itself, containing 30 names, is given a letter of the alphabet or a number in consecutive order. The questions required to be answered on the manifest are the following: Full name, age, and sex; whether married or single; the calling or occupation; whether able to read or write; the nationality; the last residence; the seaport for landing in the United States; final destination, if any, beyond the seaport of landing; whether having a ticket through to such final destination; whether immigrant has paid his own passage, or whether it has been paid by other persons, or by any corporation, society, or municipality, or government; whether in possession of money, and if so, whether upward of \$30, and how much, if \$30 or less; whether going to join a relative, and if so, what relative, and his name and address; whether ever before in the United States, and if so, when and where; whether from any prison or almshouse, or supported by charity; whether a polygamist; whether under contract, expressed or implied, to perform labor in the United States; and what is the immigrant's condition of health, mentally and physically, and whether deformed or crippled, and if so, from what cause?

These manifests, filled out, are required to be verified by the master of the vessel before the United States consul or consular agent at the point of departure before the sailing of the vessel. Under this proviso the owner of the vessel is made responsible for the deportation of the immigrant if, at the inspection on the American side, it turns out that he belongs to any of the excluded classes.

Sections 2 and 3 of the law of 1893, providing for verification by the master and surgeon, are as follows:

Each list or manifest shall be verified by the signature and the oath or affirmation of the master or commanding officer or of the officer first or second below him in command, taken before the United States consul or consular agent at the port of departure before the sailing of said vessel, to the effect that he has made a personal examination of each and all of the passengers named therein, and that he has caused the surgeon of said vessel sailing therewith to make a physical examination of each of said passengers, and that from his personal inspection and the report of said surgeon he believes that no one of said passengers is an idiot or insane person, or a pauper, or likely to become a public charge, or suffering from a loathsome or dangerous contagious disease, or a person who has been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, or a polygamist, or under a contract or agreement, express or implied, to perform labor in the United States, and that also, according to the best of his knowledge and belief, the information in said list or manifest concerning each of said passengers named therein is correct and true.

That the surgeon of said vessel sailing therewith shall also sign each of said lists or manifests before the departure of said vessel, and make oath or affirmation in like manner before said consul or consular agent, stating his professional experience and qualifications as a physician and surgeon, and that he has made a personal examination of each of the passengers named therein and that said list or manifest, according to the best of his knowledge and belief, is full, correct, and true in all particulars relative to the mental and physical condition of said passengers. If no surgeon sails with any vessel bringing alien immigrants, the mental and physical examinations and the verifications of the lists or manifests may be made by some competent surgeon employed by the owners of the vessel.

2. Immigration inspectors.—In the arrangement of floor space at the various ports it is arranged that the immigrants in their groups of 30 shall pass first before the medical inspectors who detain those whom they suspect of physical or mental defects. The others are passed along at once to the immigration inspectors, to be followed later by those who have been detained for medical examination. The immigration inspector has before him the manifest furnished by the master of the vessel, and as the immigrants file past he detains each one long enough to question the immi-

grant, to verify the entries on the manifest, and to make up his mind as to the immigrant's eligibility for entrance.

The position of the immigration inspector is the first in importance in the immigration service. These officers are intrusted with the greatest responsibility, and represent to the incoming alien the entire immigration force in so far as 85 per cent to 90 per cent of the incoming aliens are concerned. In other words, the officers in charge of this inspection determine that 8 out of every 10 aliens presenting themselves for admission to the United States shall be landed. These officers can, if they desire, allow undesirable and contract laborers to enter without further recourse. Their decision is final in all cases where they decide affirmatively for admission. The law of 1893 (sec. 5) requires each inspector to hold for special inquiry "every person who may not appear to him to be clearly and beyond doubt entitled to admission." But the law fails to provide for any review of his action or any appeal in case he should admit an immigrant about whom there might be reasonable doubt of his eligibility. This is a serious oversight, when it is considered that these officers are among the lowest paid in all the service, and that they were originally selected merely as interpreters. The question as to whether they were judicially minded and fully understood the principles underlying the immigration laws was not taken into account in their appointment. Men who were originally appointed only as interpreters or registry clerks have been placed on an equality with regular inspectors in their powers of inspection. It can not be expected that such men, themselves immigrants, shall understand the principles and objects which are desired by the American people in adopting exclusive legislation. As a matter of fact this class of inspectors are liberal in admitting people of their own race but captious in admitting other races.

There is at Ellis Island provision for 16 files of immigrants to pass continually before 16 immigration inspectors, and in this way it has been possible to examine 5,000 immigrants in 1 day of 7 hours. It may be observed in this connection, relative to the proposed educational test, that such a test would not at Ellis Island in any way increase the actual time required for passing the inspectors. The lines of immigrants are so long, and the head of the line is being so continually detained by the inspector, that it would be a simple matter to place as many educational inspectors as is necessary at lower points on the line. The educational inspection and the primary inspection could be conducted at the same time at different points along the same line. In this way the apprehension that an educational test would clog the machinery at Ellis Island on busy days, and would detain immigrants beyond the time now consumed, is groundless.

3. *Boards of special inquiry.*—An important innovation in the law of 1893 was the creation of the boards of special inquiry. Prior to the creation of these boards, under the act of 1891, the decision of the inspection officer or of the commissioner of immigration at the ports was final unless appeal was taken to the Superintendent of Immigration, whose action was subject to review by the Secretary of the Treasury. But the law of 1893 introduced the new feature of a jury, or an administrative court, the so-called board of special inquiry. Henceforth the immigration inspector does not pass final decision in case of exclusion, but merely holds the immigrant for a hearing before this new board. For this purpose it is the inspector's duty to detain for special inquiry "every person who may not appear to him to be clearly and beyond doubt entitled to admission."

The members of the board of special inquiry are taken from the existing list of inspectors, but in order that they may have high standing they are designated in writing by the Secretary of the Treasury or the Commissioner General of Immigration. They are 4 in number, and no immigrant is admitted on special inquiry except under a favorable decision made by at least 3 of said inspectors. Furthermore, the commissioner of immigration at the port is deprived of authority in the matter, and appeals are taken directly to the Superintendent of Immigration, whose action is subject to review by the Secretary of the Treasury, as originally provided in the law of 1891. This appeal may be taken either by the immigrant himself or by any dissenting member of the board of special inquiry.

It will be seen that in the board of special inquiry the law contemplates an administrative court, which shall be free, as much as possible, from the personal motives of the individual inspector, and shall be able to establish certain standards for the guidance of the inspection at each port.

On the average it is found that these boards of special inquiry admit 80 to 90 per cent of the immigrants detained for their examination by the primary inspectors. In this way the per cent of immigrants deported ranges from 0.11 of 1 per cent in 1890 to 1.45 per cent in 1898 of all the immigrants who pass before the primary inspectors. The number actually deported has increased from 3,229 in 1898 to 4,602 in 1900, although the ratio to total arrivals has decreased from 1.45 to 1.02 per cent.

This is shown by the following tables, giving for 9 years the deportations for each cause, the total deportations, and the per cent of total deportations to total arrivals.

TABLE 1.—*Number of immigrants arriving, the number excluded, and the percentage of excluded to arrivals, 1890 to 1900.*

Year.	Total number of immigrants.	Total number debarred.	Per cent debarred.
1890.....	455,802	535	0.11
1891.....	516,253	1,026	.19
1892.....	579,773	3,782	.64
1893.....	439,730	1,630	.36
1894.....	285,631	2,806	.98

4. *Contract labor inspectors.*—The method by which the special inspectors, appointed to enforce the contract labor law, perform their duties has been as follows: During the administration of the State commission the contract labor inspector was present at each examination made by the State inspector, and it was his duty, acting under orders of the collector of customs, following the examination made by the State inspectors, to make a separate examination of such cases as he had reason to believe were being imported in violation of the alien contract labor law. To do this, the immigrant was taken to one side with an interpreter and required to make an affidavit under the questioning of the inspector. This affidavit being sworn to was the legal evidence and record upon which his deportation was ordered. This method of examination was continued after 1890, although the Government had undertaken to displace the State inspectors altogether. Congress continued to make separate appropriation for the inspectors of contract labor, and for the other inspectors appointed to enforce the provisions excluding criminals, public charges, and those affected with loathsome and contagious diseases.

The contract labor inspectors were not placed upon the list of immigration inspectors, although they always had places upon the boards of special inquiry, but continued to act as a separate body. This dual system continued until June, 1900, when the commissioner at the port of New York transferred the contract inspectors from their separate and independent positions and placed them upon the list as primary inspectors, or gave them positions upon the board of special inquiry, exactly like other inspectors. Since that date the inspection of immigrants for all causes has been uniform.

Now, the peculiar and striking result of this change in administration has been a remarkable falling off at the port of New York in the number of contract laborers debarred. This is shown by the following table, wherein it appears that the deportations for June, 1900, the last month of the old system, were 38, and for July, 1900, the first month of the new system, were only 1, with an increase as high as 38 in March, 1901, but usually far below the number of the preceding record:

TABLE 3.—*Contract laborers debarred, port of New York.*

			May	67,038	22

The explanation of this falling off in deportation of contract laborers is found in the abandonment of the affidavit system formerly practiced by the contract labor inspectors. Upon this important change in method serious differences of opinion exist between the officials of the Bureau at Washington and the commissioner at New York. On the one side it is argued that "there are what may be regarded as two separate systems of legislation in this country relating to the control of alien immigration; the first system proscribing such aliens as are believed by Congress to be detrimental to the welfare of the citizens of the Union, as a whole, if permitted to land; the other class excluding aliens who, it may be confessed, are individually in a high degree acceptable in many instances, but who come under conditions which conflict with the interests and rights of certain classes of American citizens.

"In other words, viewed as to the persons whose well-being they are intended to protect, the "immigration laws" may be regarded as general, while the "contract-labor laws" are specific.

"The general laws provide the means for their own enforcement in what is known as the head tax, or immigration fund; the specific laws, on the other hand, contain no such self-sustaining provision, and Congress distinguishes them broadly from the former by making specific provision for cost of their enforcement in the annual appropriation bills.

"The officials appointed for the administration of the alien contract-labor laws have different duties to perform from those discharged by officials appointed to enforce the "immigration laws," and the distinction between them is emphasized by their payment, respectively, from different funds. As a consequence of the more specific duties of the contract-labor inspectors, more care was used, in their selection and appointment, to secure officers who, either by reason of some special familiarity with labor conditions in the United States or because of their superior intelligence, could detect and prevent attempted violations of the law, than seemed necessary in the appointment of immigrant inspectors, whose work is largely a matter of simple external observation of the individual alien.

"In actual practice at the ports the inspection was made as follows: The aliens arranged in groups filed one after another past an official designated formerly as registry clerk. This official compared the answers in reply to his interrogations of each alien with the description contained of such alien in the ship's manifest on the desk before him. If the answers were satisfactory in all respects, the alien was passed or admitted; if, on the other hand, the replies were contradictory or equivocal, the alien was detained by the registry clerk for an examination by an inspector. These registry clerks were appointed simply for their familiarity with the languages spoken by the aliens, and irrespective of their qualifications in other respects; but grew, in course of time, by a professed application of the principles of civil-service reform, to be "assistant immigrant inspectors," dependent for the removal of the prefix upon their ability to get the raise of pay that would put them a class higher. "To return to the mode of inspection, after an alien was passed by the registry clerk, a contract-labor inspector, one of whom was stationed at the head of each row or aisle, and in full sight and hearing of the examination, if he suspected the alien of being under a contract to work in this country, took him aside for further examination.

"In this examination, which was made separately and apart from the mass of the immigrants and officials, and before the alien's testimony could be biased by any

information as to its effect upon his admission, an interpreter was used. If no facts were elicited to justify the inspector's suspicion, the alien was dismissed without a hearing before a board of special inquiry, thus saving its time for the consideration of other cases. If, on the contrary, the facts disclosed the existence of an agreement to work in the United States as the inducement to the alien's migration, those facts, in the form of replies to the inspector's interrogations, were embodied in a written affidavit, which, upon completion, was read to him by the interpreter, and, if then affirmed by the alien to be true, was acknowledged by him under oath before the inspector. This course was pursued both as a reasonable precaution to prevent his retracting or denying what he had said, if, after the examination, the alien should be apprised by counsel or friends of the effect of his statement, and because the act of March 3, 1891, prior to the establishment of boards of special inquiry, provided that: "The inspection officers and their assistants shall have power to administer oaths, and to take and consider testimony touching the right of any such aliens to land, all of which shall be entered of record." And at that time there was no other means to enter such testimony of record.

"After the establishment of boards of special inquiry, as provided in section 5 of the act approved March 3, 1893, the alien was taken before the board after signing the affidavit and examined by it, the said affidavit being used as the basis of the board's reexamination of the said alien. In order that any injustice to him, arising from a misunderstanding on his part, might be avoided, the commissioner at the port of New York, where the above-described system was in force, was repeatedly directed by the Department to instruct the board that it should inform such alien that it was not necessary for him to prove he had work secured to obtain admission to the United States. If the alien still persisted in the statements contained in the affidavit, to the allegations contained in which the examination of the board was not confined, he was refused a landing, and at the same time notified of his right of appeal to the Department. This right he frequently exercised, the Department sometimes overruling the board, either solely upon the evidence considered by the board or upon that and such other evidence besides as might be submitted, together with argument of counsel in his behalf, and always giving due weight to the recommendation contained in the commissioner's letter transmitting the record to the Department. Sometimes the alien denied the statements contained in the affidavit, and in this case, unless evidence could be secured to dehorn the affidavit, corroborating it, the alien, if otherwise admissible, would be permitted to land.

"In its workings, as may be reasonably assumed from the above account of it, the affidavit system was entirely satisfactory, both in insuring detection of attempted violations of the law and in preventing injustice to the alien on account of any misapprehension of the law on his part. The agents of the transportation lines and the most experienced and intelligent officers at the New York station are on record as of opinion that a similar system applied in the administration of the immigration laws would expedite the landing of many needlessly detained aliens and avoid the waste of time by the boards of special inquiry in considering the cases of those held for its reexamination upon frivolous or insufficient grounds.

"As might have been anticipated, the existence at the New York station of a separate and more intelligent class of officers, paid on an average 50 per cent larger salaries than the immigrant inspectors, aroused the jealousy of the latter, and was productive of friction. The contract-labor inspectors, too, were men of sufficient good sense to know their duties under the law, and of sufficient strength of will to refuse to submit to any attempt to interfere with the faithful discharge thereof.

"These officers were placed under the immediate administrative management of a supervising inspector, just as the immigrant inspectors and registry clerks were under a chief, and both of these divisions were equally subordinate to the Commissioner of Immigration.

"As a consequence of their superiority, moreover, the contract-labor inspectors were and are specially useful as members of the boards of special inquiry, upon which they continue to serve. All officials who act as board members are empowered so to serve in writing by the Secretary of the Treasury or by the Commissioner-General of Immigration upon the recommendation of the commissioner of the port, who designates such of them from time to time for active duty thereon as he may see fit.

"In the spring of 1900, the commissioner at the port of New York, without authority of the Department so far as the Commissioner-General of Immigration is aware, and despite his orally expressed disapproval of such step, abolished the affidavit system. This placed the two classes of inspectors upon the same footing as far as possible, the distinction becoming one rather of pay than of character of work, so far as actual inspection is concerned. The practical results of the change may be seen by examination of the following table:

Total arrivals July, August, and September, 1899	73, 809
Rejected for same period as contract laborers	126
Total arrivals for same period, 1900	94, 444
Rejected for same period as contract laborers	18

"During the last-named period under the new system there were detained and sent before the boards of special inquiry for examination under the alien contract-labor laws, out of aggregate arrivals at New York of approximately 95,000, but 115 suspects, less than those rejected during the corresponding period of the next preceding year, out of 25 per cent less arrivals. While this showing may suggest to some minds the inference that the change is an improvement, as showing that the great majority of those formerly denied were entitled to land, the less agreeable but equally reasonable conclusion may be drawn therefrom that the purpose of the law has been practically defeated by the admission of many not entitled to land. In considering which of these two opposing views is correct it would seem but natural for Government officials to lean toward the latter, and thus avoid the damaging admission that they have been rejecting for years so many aliens entitled to admission—a wrong which, if committed, equally involves the officers at the port of New York and those at the Department in Washington, not excepting the Secretary of the Treasury, to whom all can appeal and without whose approval none can be finally refused permission to land."

The commissioner of the port of New York explains the change in administration in the following way:

The modus operandi of making contract labor cases under the affidavit system was simple and deceptive to the alien. In the first place, it must be borne in mind that the meaning of the contract labor law is beyond the comprehension of the ordinary alien coming to this country. On the other hand, the reason for refusing admission to an alien because he was likely to become a public charge is easily understood by the most obtuse. Under the old system the examination of the alien for all other cases except that of contract labor was performed by other immigration officers, and if the alien passed this examination he was turned over to a contract labor inspector, who interrogated him as to this point only. What more natural than that the alien, eager to escape the Scylla of a public charge exclusion, should run into the Charybdis of the contract labor law. Had the alien work promised him? Yes. Brother, cousin, or friend, already in the United States, had written him telling of their success, and, it may be, saying that if he came over here he might find work with them. With this basis of fact, the alien, eager to prove that he would not become a public charge, and the inspector, equally eager to secure a confession of a promise or assurance of work amounting to a contract to perform labor in the United States, were not long in coming to an agreement. The result was an affidavit, written by the inspector and signed by the alien, which generally appeared to be worthless upon its face as a legal document, for the reason that it showed a conclusion and not a statement of the facts necessary to arrive at that conclusion, and in a great many instances the conclusion was that of the writer of the affidavit and not of the alien. The alien and inspector were alone. The alien generally had a wrong conception of the reason why he was being asked these questions, and imagined that this was a part of the process which it was necessary for him to go through in order to obtain admission to the United States. In all cases except English speaking aliens (and these were so few as not to amount to any appreciable per cent) the affidavit was written, not in the language of the alien, but in English. Once this affidavit was obtained, the alien, accompanied by the inspector, proceeded to the board of special inquiry, where the affidavit was read to its members by the inspector. The board caused it to be interpreted back to the alien, and in a large majority of cases the alien confirmed his affidavit, being consequently excluded.

So far as the working of the board of special inquiry is concerned, the affidavit system did not produce satisfactory results. The affidavit of the immigrant, constituting as it did a prepared conclusion of the contract labor inspector, the examination before the board was naturally more or less restricted as to what was contained therein, and any attempt by any member of the board to differ from that conclusion was generally the cause of unpleasant attrition between its members and the then contract labor bureau. If the alien had stated falsely in his affidavit, believing that it would assist him to land, it was only natural that he should persist in corroborating it, especially with the inspector standing at his side, therefore, the full truth concerning such aliens coming to this country was scarcely ever developed under this system. Unless the person named in the alien's affidavit as being the one who had contracted, induced, or assisted him to come to the United States made an application for a rehearing, this was all the trial the alien received before being deported.

There is little doubt that the same percentage of the 115 cases that were tried by the board in the 3 months of July, August, and September, 1900, would, if they had been tried under the old affidavit system, have been excluded and deported, the difference being that in one case the immigrant was convicted on his affidavit only, and the other where all the facts were developed.

Under the present system all the facts connected with the case must, of necessity, be known to the board of special inquiry, while under the former system material facts might have been in the possession of the inspector, or some one in the contract labor bureau, but the board would have remained in total ignorance of them if not thought fit by the contract labor bureau to lay those facts before the board.

5. Deportation within one year after landing.—The act of October 19, 1888, added an important amendment to the law by providing that an immigrant who might escape the vigilance of the inspectors at the ports might nevertheless be arrested within 1 year after landing and then deported exactly as he would have been had the inspector debarred him before landing. The law as amended authorizes "the Secretary of the Treasury, in case that he shall be satisfied that an immigrant has been allowed to land contrary to the prohibition of the law, to cause such immigrant, within the period of 1 year after landing or entry, to be taken into custody and returned to the country whence he came, at the expense of the owner of the importing vessel; or, if he entered from an adjoining country, at the expense of the person previously contracting for the service."

The importance of this amendment can readily be understood, and its significance may be judged from the table (Table 2) on page —, where it appears that the immigrants returned within 1 year numbered 356 in 1900, out of a total number returned of 4,602.

It is still questionable whether the period of 1 year is long enough. In New York City there is a serious complaint on the part of the public authorities on account of the large number of aliens who bring their children or dependent relatives to the public institutions at the end of the first year of residence. Under State law 1 year's residence is required to gain legal domicile entitling to the benefits of public charity, and the immigration law of 1891 provides that "any alien who becomes a public charge within one year after his arrival in the United States from causes existing prior to his landing therein shall be deemed to have come in violation of law and shall be returned as aforesaid."

If, now, when alien applicants appear at the end of a year, and by their application for help formally concede that they are paupers, the immigration authorities were legally enabled to arrest and deport them, a large amount of undeserved expense would be saved to the public treasury.

Again, the 1-year period is peculiarly valuable in the case of contract laborers. This class of immigrants now comes to this country admirably "coached" in all the answers which they shall give to the inspectors. It is well known that the business of collecting peasants from the villages of Italy and Austria-Hungary and shipping them to importers in New York, Chicago, and other places has become so highly perfected and developed that it is practically impossible under existing law to discover their true character at the port of landing. The main safeguard, therefore, is in the power of the Bureau of Immigration, through its special agents and detectives, to follow these suspected immigrants to their places of employment where the evidence against them may be secured.

Doubtless, here again, it may seem to be placing a large amount of arbitrary power in the discretion of the Secretary of the Treasury, in that his warrant, without judicial hearing, should be the sole instrument on which aliens are arrested and sent out of the country. This power, however, has been found to be necessary, in order to remove the administration of the law from the delay and formalities of legal procedure.

Since a law of this kind depends for both its interpretation and its energetic enforcement upon executive officers, it may be of interest to trace its operation in a few leading instances where records are available. With this in view, the following recent typical cases have been selected:

F. CASES SHOWING THE OPERATION OF THE CONTRACT LABOR LAWS.

1. *Case of Croatian stove cutters.*—On September 15, 1899, the Bureau of Immigration received confidential information "to the effect that about 200 or 300 Austrian stove cutters are coming to work for the various stove camps in Mississippi, Louisiana, and Texas. These workmen are expected to come secretly in the near future via Baltimore, New Orleans, and Galveston."

One company of 9 Croatians arrived September 24 at New York. They brought with them various sums of money ranging from \$30 to \$50 each and were provided with railroad tickets to Cincinnati, Ohio, although they had no friends or addresses in that city. They declared that if they were unable to find work at Cincinnati they would go to Memphis, having noticed that place upon the map. They had also the address of one Kronberger, at Ruleville, Miss., said to be the agent of the Austro-American Stave and Lumber Company at that point.

Immigrant Inspector Milton Smiley, at Cincinnati, was ordered to meet these immigrants. On October 5 he reported that 5 Croatians had bought tickets at Columbus, Ohio, for St. Louis and 4 to Memphis, Tenn., all of the same party. They were accompanied by a man who could speak English, but who did not purchase the tickets directly. At Cincinnati he met the 9 people in question, asked where they were going, and they showed him their tickets for Birmingham, Ala., purchased at Washington, Pa., and Columbus, Ohio. He said: "It was at once conclusive in my mind that some one at Pittsburg or along the line was helping them along." Since Washington, Pa., is off the main line of the Pennsylvania Railroad, he inferred that some one had gone there from Pittsburg and gave the tickets to them at Pittsburg. He discovered later on inquiry of the ticket agent at Columbus, Ohio, that 5 tickets had been sold to these foreigners for St. Louis and 4 to Memphis, Tenn., all of the same party. They would give no information as to their work at Memphis, but were going to look for work. The interpreter told them they could get work at Cincinnati, but they preferred to go to Memphis because they had tickets. The leader of the party said that he had been in the United States before, but in Mr. Smiley's opinion he was the agent of the contractor.

In November, 1899, Inspector T. W. Levy was detailed as a detective to the stove-cutters' camp near Greenville, Miss., where he interviewed the boss of the stove-cutters' camp. He learned that there were 130 men, all Slavonians, in camp, being the largest single camp in the United States, under Leopold Kerne Stave Company, of Vienna, Austria, with American headquarters at Memphis, Tenn. Nearly all had been here less than a year. All but a few had landed at New York or Baltimore. Only

one had come through Galveston. That there was no trouble to get men, but the companies were now very careful, as the Government was watching them, and heavy penalties would follow if they were caught. But only a short time back 36 men destined to work for his company were sent back to New York. These men had foolishly brought axes and other tools from Austria in their baggage, and got caught in consequence. That over 100 who came at the same time were allowed to land, as they had been smarter and had brought no give-away tools. That the 36 sent back were a part of the others that landed. That there was contract with the men, but all knew and understood that they were to work for his company. That in almost every part of Austria in the stave-cutting districts there are steamship posters telling of the attractiveness of this country, of wages paid for stave cutting, and the stave districts in this country, and that stave men were wanted there. That he did not know for certain, but believed that there were special agents who worked up parties of stave cutters and gave a big discount in passage to the party. That the men who came over in these parties brought very little baggage under advice, and no telltale tools; and all know how to answer questions propounded by Government officers as to their being under contract. That 5 and 6 years ago the stave companies imported men, but there was no need for this now, as matters were "understood," and men who "understood" things could go to work at once on arrival. That men came to Memphis and other places, and from there were distributed to camps. That the foreman kept men's names, but usually "run them by numbers, like a lot of damned convicts." That "it would be no use to show me men's names, as I could not remember or pronounce a single one." That he did not know his men's antecedents, or how or when they came, and did not want to know.

Mr. Levy also says that the names of Karesch and Stolzky, ticket men at Bremen, "which have bobbed up in almost all my investigations, are either themselves or by their agents at the bottom of these importations and assist in them by advice and perhaps work. Certain it is that all men imported through Galveston said that Karesch and Stolzky had told them of localities to which they were going. They no doubt told them of contract laws, of axes and tools as give-aways in baggage and advised leaving them behind, etc. That practically all stave cutters 'understand things' before they leave Austria. That those who do pass inspectors because of lack of sufficient evidence can be followed, and will be found to go to Goebel's Hotel in Memphis, Yielsh Hotel in Shreveport, and a no-name hotel near union depot in Little Rock and from these places at once to the woods, and that once in the woods, unless followed, it is a difficult matter to locate them, as the forests are large in area and the canebrakes in parts almost impenetrable."

In a later communication Mr. Levy wrote that his investigations led him to believe that the contract labor laws have been systematically broken by people connected with the stave business. "In my travels recently I have located a dozen or more camps of stave cutters in which there are many men. I estimate the number at nearly, if not quite, 1,500, three-fourths of whom have been in this country less than 2 years, and the large majority of these less than 1 year, and nearly all of whom came exactly like those off *Köln* came—previously contracted for. * * * Shreveport and Little Rock are the great distributing points. There are dozens of stave factories throughout Arkansas, Louisiana, Mississippi, and Tennessee. The points named are the best for labor-distributing points. I do not believe that there are 2 per cent of the Austrians that go to the above-noted points that are not under contract as stave cutters. I have been painstaking and energetic in my labors, and gone into camps far from the railroad and walked to get into them; have talked with citizens and Slavs and am firmly convinced that the business of stave cutting is done by Austrians systematically imported by interested people and through every port of any consequence on the Atlantic and Gulf seaports, to avoid suspicion, and that positive evidence can never be had, and that the business of importing had reached very large proportions."

Later he wrote: "It appears to me that the importation of Austrians for stave cutting is above all big things of this kind in recent years. The staves these fellows cut are cut by no one in this section of the country, being of a peculiar kind intended for the French and Austrian markets exclusively. No one cuts these staves except Austrians anywhere in the South or Southwest. * * * It is impossible to have direct positive evidence against importers or men. They are too well versed in the laws, but the train of circumstantial evidence against men and importers is sufficiently strong to at least deport, as in the case of our 'farm laborers' off the *Köln*, and other ships."

After the stave cutters had been arrested for deportation, B. Kobler, manager of the Austro-American Stave and Lumber Company, headquarters Shreveport, La., appeared in their behalf and stated that owing to the exhaustion of the forests in Austro-Hungary and Slavonia the stave-cutting industry was compelled to remove to other countries, and was located at districts surrounding Memphis and Shreveport, and naturally the stave cutters, who knew nothing but farming and stave cutting, being thrown out of employment in Austria, came over in large numbers to

these American districts. That the 15 men on the steamship *Kula* now under arrest did not have any contract with him or anyone else. But that they had applied to him for work and he had wired to Antone Kronberger, the owner of a stove-cutting concern, asking if he could give employment to these men. They were competent workmen, and the affiant had no interest in them, except that they were countrymen of his in distress, to whom he would like to see justice done.

In January, 1900, Inspector Levy, at Galveston, made the formal and personal tender of the 15 Slavs for deportation by the steamship *Roland*, but the local agent refused to receive them, whereupon he swore out a warrant, upon which the agent was arrested and then released upon a \$3,000 bond.

The district attorney recommended dismissal of the agent on the ground that the law does not contemplate criminal prosecutions in cases after landing. The commissioner thereupon dismissed the prosecution. The district attorney thereupon recommended deportation, and the steamship company consented to receive the men, deport them to Germany on a steamship, and to pay the cost of maintenance while in Galveston.

7. **Dr. Dowie's lace makers.**—The lace curtain case reported on page — served as a precedent to the Secretary of the Treasury in the case of the lace makers imported by Dr. Dowie to establish a lace factory at Zion, Ill. Dr. Dowie, through his attorneys, had communicated with the Secretary of the Treasury under date of April 25, 1900, explaining the proposed importation of lace makers from England, and asking to be informed whether he would, in the opinion of the Secretary of the Treasury, be transgressing the law in any particular if he could carry out his plans as at present formulated. Dr. Dowie's attorneys argued that "skilled workmen from foreign countries may be engaged under a valid contract or agreement to perform labor or service in the United States in or upon any new industry, provided such workmen can not be obtained here." They also (*U. S. v. Bromily*, 58 F., 551) held that the alien contract labor law was designed to apply only to the importation in large numbers of foreign unskilled laborers under contract to perform labor or service in the United States.

The Amalgamated Lace Curtain Operatives of America, on May 19, had submitted to the commissioner-general, in reply to his inquiry, a list of the factories at that time established. They were: Tariffville Lace Making Company, established 9 years, 9 machines, 58 operatives, firm recognizes union; Scranton Lace Company, Scranton, Pa., established 9 years, 250 operatives, 17 machines, firm recognizes union; Patchogue Lace Manufacturing Company, Patchogue, L. I., established 9 years, 350 operatives, output 10,000 pairs lace curtains per week, 22 machines, does not recognize the union, but expected to do so in a very short time; Columbia Lace Mills, Campbell & Celand owners, established 8 years, about 60 operatives, does not recognize the union. Wages vary from \$10 to \$25 per week. The secretary of the union stated:

"I have enough applications already to fill the places of the men that Dr. Dowie wants to import except the last 3 which is mentioned in your letter of the 8th. Sorry that I can not give you any information about those 3, as they are trades that we know very little about at present. * * * Two hundred and twenty-nine machines in the country; 2 men to each machine. A lockout at the Wilkesbarre mill affected 14 men, 49 women, and 26 boys, who could supply Dr. Dowie's mills if needed. At some of the mills we only work three-fourths time."

Dr. Dowie advised the Department from Edinburgh, on November 3, that the first party of his lace makers and families would arrive about November 12 at Philadelphia. He said the party comprised only 3 lace makers, but included also their wives and families, and that the principal party would leave on the return voyage of the steamer in December. The number of actual lace makers, including "draftsmen," will not exceed 35 to 40, all of them going out as practically chiefs of departments, the object being not to import work people in numbers from Great Britain, "but to educate our own people in America, for whose benefit these industries are being established." Dr. Dowie had purchased outright the plant at Beeston, England, and had shipped or was about to ship to this country the machinery of the mill for use in the new establishment. The emigrants, who arrived at Philadelphia, while claiming not to be under contract with Dr. Dowie, all expected to secure employment with him. The board of special inquiry of Philadelphia debarred them on the ground that lace making is an industry fully established in this country and that skilled workmen could readily be obtained in this country at short notice to fully man the new mill about to be started by Dr. Dowie. Dowie's attorneys thereupon appealed to the Secretary of the Treasury, alleging that the manufacture of Lever's fancy lace upon the improved Lever machines is a new industry not established in the United States on February 26, 1885, and not now established here, and skilled labor for this purpose can not be obtained otherwise than from abroad.

The board of special inquiry unanimously voted to debar 5 of the immigrants as coming in violation of the alien contract labor law and the remainder as likely to become public charges.

The Secretary of the Treasury decided, on appeal, November 26, 1900, in favor of Dr. Dowie and the immigrants, both those charged with violation of the alien contract labor law, and also those as likely to become public charges. The ground of his decision is stated as follows: "Although lace making with some of its branches has been carried on in this country for some years, heretofore it seems to have been the practice to import the thread used in such establishment. The Department is of the opinion that said industry is a new one, not established, and is within the exception mentioned in the act of February 26, 1885, and as it is not claimed or shown by representatives of the lace makers' union that labor could have been obtained in this country to prosecute the industry, there is apparently no violation of the alien contract labor law."

The decision seemed to turn on the distinction between the old and the new form of the Lever machine. Affidavits were presented maintaining that the modern machine is a great improvement on the old type; that there are only from 7 to 9 of these modern machines in the country, all of them brought here within the last 15 months, and that the firm which brought them (The American Textile Company, of Pawtucket, R. I.) had made many efforts to obtain hands in this country, and that it would be a difficult matter, with the rush of machines now coming to this country, to find sufficient workmen here to handle all these modern Lever machines at once.

8. *Buffalo and Pittsburg tailor cases.*—The defects in the alien contract-labor law, as shown in the decisions cited in preceding pages, have their main effect in their influence upon the United States district attorneys whose business it is to prosecute the cases. This comes plainly to view in a recent Buffalo case: The immigrant inspector at that port, Mr. J. R. De Barry, reported on August 28, 1900, that a deputization from the tailors' union of Buffalo called on him and stated that Messrs. Fullaytar & Keen, tailors of Buffalo and Pittsburg, were for some time past importing tailors on pauper wages to work for them in Buffalo and Pittsburg at \$2 per week and board; that 10 had already arrived, others expected, and that citizens were being discharged and their places filled with this pauper labor; that in the offices of J. W. Klauke, steamship agent, the inspector himself saw stubs on which were the names of the contract laborers, showing that Joseph Keen, of 877 Main street, Buffalo, had paid their passage and sent for them. The inspector stated that copies of the statements of the contract laborers had been made for the district attorney, who had directed him to make complaint against Joseph Keen, under sections 1 and 6 of the laws of 1891. The statement of these tailors showed that they were natives of Hungary and tailors by occupation; that they came to the United States in January to August, 1900; that prior to coming one of them had received letters from a brother which said that he would get him work with Mr. Keen, of Buffalo, at \$2 a week. Mr. Keen sent him \$25 in a post-office order from Buffalo and is now paying \$2 per week and board. No written contract. Had letter from Mr. Keen about September 29. Another, whose son Joseph was working for Mr. Keen, received \$32 from his son, and Mr. Keen wrote him and sent him passage ticket from Hungary to Buffalo and 25 florins, to go to work for him. He did not say how much per week he would receive. Another received passage ticket from Mr. Keen through his cousin, who was acting foreman in the shop. Did not say how much per week he would get. Another received a letter from "a kind of foreman in the shop," who wrote and said Mr. Keen would settle the amount he was to receive per week when he came, after the first week. Received 25 florins by letter from Mr. Keen. Is now receiving \$10 per week. Another has written to one of the employees of Mr. Keen to get work. The latter spoke to Mr. Keen and then wrote that Mr. Keen would give him work if he came. The five aliens were arrested by the deputy marshal and brought before Commissioner Welman, who let them out on \$200 bail, each. So important was the case believed to be that the Attorney-General directed by telegraph United States Attorney Charles H. Brown, of Buffalo, to take charge of the case himself, without leaving it to his assistant. Mr. Brown did so, and then advised the Attorney-General as follows: "I personally examined each of the aliens alleged to have been imported by Joseph Keen in violation of the alien contract-labor law before the grand jury of the Lockport term of the United States district court last week. On such examination it clearly appeared that in no case did Joseph Keen aid or assist in the importation of any of these aliens from Hungary to the United States, who were under contract to perform labor in the United States made previous to such importation. Each of the aliens was examined fully through an interpreter, and no facts could be deduced upon which a charge of violating the statute could be based. A careful consideration revealed the fact that these aliens did not come to the United States under a contract to perform labor in the United States made previous to their importation. * * * The fact that this subject has been a matter of considerable correspondence, in which reference is made to the desire on the part of the Treasury Department that I should give this case my personal attention, inclines me to the opinion that some representative of the Treasury Department has labored under the impression that simple proof of the sending of means of transportation by the defendant to an alien in a foreign country is all that

is required to secure a conviction for violation of the alien contract-labor law. I was especially careful and designed to be extremely thorough in a full and complete examination to develop the essential facts upon which to base a prosecution, but no case could be made out and no indictment was found." And in a later communication he added, to enable them to indict the alleged contractors: "For the reason that such evidence did not exist. * * * If any fact can be called to my attention that will establish a contract made by the aliens and the defendant, Keen, prior to their importation, within the terms of the statute itself and as construed by the circuit court of appeals of the eighth circuit in 48 F. R., 91, and the circuit court of appeals for the fifth circuit, 57 F. R., 490, and the case of *The United States v. River Spinning Company*, 70 F. R., 978, and *The United States v. Gay*, 80 F. R., 254, I will be only too glad to present it to any future grand jury."

Another example of the hesitation of the law officers of the Government to undertake the prosecution of contract importation cases in view of the decisions of the courts, is that of the same firm of Fullaytar & Keen in the branch at Pittsburg, Pa. The immigrant inspector at that station, Mr. R. D. Layton, secured the affidavit of the alleged imported laborer and of the agent with whom the alleged contract was made, and of the importer himself. The statements are apparently so conclusive that they seem to give proof of a complete contract. They show that the importer advanced the passage money and agreed to the amount of compensation per week. The only link which can be said to have been omitted is that of the period during which employment was to continue. Nevertheless, the United States district attorney did not see his way clear to prosecute the case. The affidavits and correspondence are submitted herewith:

SWORN STATEMENT OF MARTIN HUSCKA.

I am 31 years old. Am a native of Hungary. This is the first time I ever was in this country. came here last March. Arrived in the steamship *Saale*. I am a ladies' tailor by trade. When I was at home I met John Clement, also a ladies' tailor, who told me I could do very much better in America, and that he could get me a job with the firm he worked for in that country. I have known Mr. Clement for about 8 years, and I told him "all right, I would go, but could not afford to pay the passage." He said, "I will fix that all right." He wrote to the firm of Fullaytar & Keen, No. 412 Penn avenue, Pittsburg, about me, and he answered and said all right, he would send the money, and he did send him \$50 money order. I signed the receipt to Mr. Clement and got the money and came over and went to work for Fullaytar & Keen. The letter said he would pay me from \$12 a week up, according to my ability. After I had worked a few months he began fussing with me about the \$50 which I refused to pay back. He then told the cashier to deduct the money from my pay. He did so, and I quit. After a while he coaxed me to go back, and I went back again and he again held some of my wages for the passage, and I then left for good, and have not worked any place since. I have a wife and children at home, and was doing very well. If I had known I had to repay the \$50 I would not have come. I will return as soon as I can earn the money. My friend, Mr. A. M. Bushek, who is acting as interpreter, has told me what you have written, and it is true, every word of it, and I so swear.

JOHN CLEMENT, sworn: Am 32 years old; am a native of Hungary; am a ladies' tailor by trade, and understand all you say to me. I first came to this country in 1894, then in 1898 I went back home to Hungary and stayed there until I returned on the 25th of June, 1900, on the steamship *Laquetaine*. I work for Fullaytar & Keen, at No. 412 Penn avenue, Pittsburg, Pa. I knew Mr. Fullaytar when I was here before, and when I was at home I often wrote to him. Our letters were mostly of a social nature. I wrote Mr. Fullaytar and asked him if he wanted a good man; that I knew one here who might go. He wrote me he did, and I spoke to Mr. Huscka, whom I know very well, and he said he would come out, but not unless his passage was paid. I wrote this to Mr. Fullaytar, who sent me a money order for \$50, and I gave it to Mr. Huscka, got his receipt for it, and he came out and went to work for the firm. After that he had some trouble with this firm and he stopped work. I am now working for Fullaytar & Keen. I paid my own passage.

MISS FLORENCE THORN, sworn: I am 17 years old; am cashier for the firm of Fullaytar & Keen; keep their books and assist in the business on this floor; have been there fifteen months. I know Mr. Martin Huscka; he worked here, but he has quit. He quit on the 31st of October, 1900. He worked here from the time he came to this country until he quit. I was ordered to take some money out of his wages and I did so—\$15 one time and \$15 another. As they talked in a foreign language, I don't know what it was for.

FERDINAND FULLAYTAR, sworn: I am one of the firm of Fullaytar & Keen, at No. 412 Penn avenue. I have been in business for two years and three months. I know John Clement. He is now in my employ as a ladies' tailor. I knew him when he was here before. While he was in Hungary we had a friendly correspondence. He wrote me how bad off they were in the old country and asked me if I wanted a good man. As I had trouble to get a good bratder here, I told him "yes." I needed a man, and I sent him \$50 money order to pay the passage out of Martin Huscka, who came here and I put him to work. We had trouble with him, for I thought he should pay me the \$50 back, but he refused and I ordered my cashier to hold back some of his wages, which she did—about \$30—and he stopped work, but after a time I got him to come back. He only worked a short time and he quit again, and I don't know where he is now. I thought I had a right to my money back again.

No. 24002.]

TREASURY DEPARTMENT,
OFFICE OF COMMISSIONER-GENERAL OF IMMIGRATION,
Washington, November 27, 1900.

R. D. LAYTON,
Immigrant Inspector, Pittsburg, Pa.

RE: From report contained in your communication of the 26th instant, it appears that the firm of Fullaytar & Keen, of No. 412 Penn avenue, Pittsburg, Pa., has violated the alien contract labor laws by the importation of one Martin Huscka to perform service for them in the United States under contract made prior to his immigration.

In view of this, you are directed to present all the evidence in your possession to the United States district attorney for an expression of his views; and if, in his opinion, action will lie, suit should be instituted to recover penalties prescribed by law.

Respectfully,

T. V. POWDERLY, *Commissioner-General.*

DEPARTMENT OF JUSTICE,
OFFICE OF THE UNITED STATES ATTORNEY, WESTERN DISTRICT OF PENNSYLVANIA,
Pittsburg, January 31, 1901.

R. D. LAYTON,
Immigrant Inspector, Pittsburg, Pa.

SIR: You have submitted evidence to our office of an alleged violation of the alien contract-labor law of February 26, 1885, and its supplements, by the firm of Fullaytar & Keen, of No. 412 Penn avenue, Pittsburg, Pa., by the importation and migration of a certain alien and foreigner into the United States, to wit, one Martin Huscka, then a native of Hungary and a subject of His Majesty the Emperor of Austria and Apostolic King of Hungary, for the purpose of performing labor as a ladies' tailor under agreement made prior to his migration.

After examining the evidence submitted and the law in the case, we are of the opinion that this does not come within the statute as interpreted by the court.

I herewith return all papers in the case.

Very sincerely,

DANIEL B. HEINER, *United States Attorney.*

G. CHINESE EXCLUSION LAWS AND TREATIES.

A COMPLETE LIST OF LAWS AND TREATIES RELATING TO THE EXCLUSION OF THE CHINESE.

- Treaty of November 17, 1880, between United States and China. (U. S. Stat. L., vol. 22, p. 826.)
- Act to suspend immigration of Chinese laborers to the United States. (Approved May 6, 1882, U. S. Stat. L., vol. 22, p. 58.)
- Act amending act of May 6, 1882. (Approved July 5, 1884, U. S. Stat. L., vol. 23, p. 115.)
- Act to prohibit coming of Chinese laborers into the United States. (Approved September 13, 1888, U. S. Stat. L., vol. 25, p. 476.)
- Act declaring certificates of return for Chinese laborers void. (Approved October 1, 1888, U. S. Stat. L., vol. 25, p. 504.)
- Act to prohibit coming of Chinese persons into the United States. (Approved May 5, 1892, U. S. Stat. L., vol. 27, p. 25.)
- Act to enforce immigration and contract labor laws of the United States. (Chinese are excepted by section 10 from effects of this law.) (Approved March 3, 1893, U. S. Stat. L., vol. 27, p. 569.)
- Act amending act of May 5, 1892. (Approved November 3, 1893, U. S. Stat. L., vol. 28, p. 7.)
- Convention between the United States and China of March 17, 1894. (U. S. Stat. L., vol. 28, p. 1210.)
- Joint resolution annexing Hawaiian Islands prohibits immigration of Chinese. (Approved July 7, 1898, U. S. Stat. L., vol. 30, p. 751.)
- Act providing government for Territory of Hawaii denies Chinese entrance into the United States from Hawaii. (Approved April 30, 1900, Statutes, Fifty-sixth Congress, first session, p. 141.)
- Sundry civil appropriation act puts administration of Chinese exclusion acts under Commissioner-General of Immigration. (Approved June 6, 1900, Statutes, Fifty-sixth Congress, first session, p. 588.)
- Act providing that United States commissioners may hear questions of illegal entry of Chinese. (Approved March 3, 1901, Statutes, Fifty-sixth Congress, second session, p. 1093.)

CONVENTION OF DECEMBER 8, 1894.

[28 Stat., p. 1210.]

ARTICLE I.

The high contracting parties agree that for a period of ten years, beginning with the date of the exchange of the ratifications of this convention, the coming, except under the conditions hereinafter specified, of Chinese laborers to the United States shall be absolutely prohibited.

ARTICLE II.

The preceding article shall not apply to the return to the United States of any registered Chinese laborer who has a lawful wife, child, or parent in the United States, or property therein of the value of one thousand dollars, or debts of like amount due him and pending settlement. Nevertheless, every such Chinese laborer shall, before leaving the United States, deposit, as a condition of his return, with the collector of customs of the district from which he departs, a full description in writing of his family, or property, or debts, as aforesaid, and shall be furnished by said collector with

such certificate of his right to return under this treaty as the laws of the United States may now or hereafter prescribe and not inconsistent with the provisions of this treaty; and should the written description aforesaid be proved to be false, the right of return thereunder, or of continued residence after return, shall in each case be forfeited. And such right of return to the United States shall be exercised within one year from the date of leaving the United States; but such right of return to the United States may be extended for an additional period, not to exceed one year, in cases where by reason of sickness or other cause of disability beyond his control, such Chinese laborer shall be rendered unable sooner to return—which facts shall be fully reported to the Chinese consul at the port of departure, and by him certified, to the satisfaction of the collector of the port at which such Chinese subject shall land in the United States. And no such Chinese laborer shall be permitted to enter the United States by land or sea without producing to the proper officer of the customs the return certificate herein required.

ARTICLE III.

The provisions of this convention shall not affect the right at present enjoyed of Chinese subjects, being officials, teachers, students, merchants, or travellers for curiosity or pleasure, but not laborers, of coming to the United States and residing therein. To entitle such Chinese subjects as are above described to admission into the United States, they may produce a certificate from their Government or the Government where they last resided viséd by the diplomatic or consular representative of the United States in the country or port whence they depart.

It is also agreed that Chinese laborers shall continue to enjoy the privilege of transit across the territory of the United States in the course of their journey to or from other countries, subject to such regulations by the Government of the United States as may be necessary to prevent said privilege of transit from being abused.

ARTICLE IV.

In pursuance of Article III of the immigration treaty between the United States and China, signed at Pekin on the 17th day of November, 1880 (the 15th day of the tenth month of Kwanghsu, sixth year), it is hereby understood and agreed that Chinese laborers or Chinese of any other class, either permanently or temporarily residing in the United States, shall have for the protection of their persons and property all rights that are given by the laws of the United States to citizens of the most favored nation, excepting the right to become naturalized citizens. And the Government of the United States reaffirms its obligation, as stated in said Article III, to exert all its power to secure protection to the persons and property of all Chinese subjects in the United States.

ARTICLE V.

The Government of the United States, having by an act of the Congress, approved May 5, 1892, as amended by an act approved November 3, 1893, required all Chinese laborers lawfully within the limits of the United States before the passage of the first-named act to be registered as in said acts provided, with a view of affording them better protection, the Chinese Government will not object to the enforcement of such acts, and reciprocally the Government of the United States recognizes the right of the Government of China to enact and enforce similar laws or regulations for the registration, free of charge, of all laborers, skilled or unskilled (not merchants as defined by said acts of Congress), citizens of the United States in China, whether residing within or without the treaty ports.

And the Government of the United States agrees that within twelve months from the date of the exchange of the ratifications of this convention, and annually thereafter, it will furnish to the Government of China registers or reports showing the full name, age, occupation, and number or place of residence of all other citizens of the United States, including missionaries, residing both within and without the treaty ports of China, not including, however, diplomatic and other officers of the United States residing or travelling in China upon official business, together with their body and household servants.

ARTICLE VI.

This convention shall remain in force for a period of ten years, beginning with the date of the exchange of ratifications, and, if six months before the expiration of the said period of ten years neither Government shall have formally given notice of its final termination to the other, it shall remain in full force for another like period of ten years.

In faith whereof we, the respective plenipotentiaries, have signed this convention and have hereunto affixed our seals.

Done, in duplicate, at Washington the 17th day of March, A. D. 1894.

WALTER Q. GRESHAM. [SEAL.]
(Chinese signature.) [SEAL.]

And whereas the said convention has been duly ratified on both parts, and the ratifications of the two Governments were exchanged in the city of Washington on the 7th day of December, one thousand eight hundred and ninety-four:

Now, therefore, be it known that I, GROVER CLEVELAND, President of the United States of America, have caused the said convention to be made public, to the end that the same, and every article and clause thereof, may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the City of Washington this 8th day of December, in the year of our Lord, one thousand eight hundred and ninety-four, and of the Independence of the United States the one hundred and nineteenth.

[SEAL.]

GROVER CLEVELAND.

By the President:

W. Q. GRESHAM,
Secretary of State.

EXCLUSION ACT OF 1882 CONTINUED UNTIL 1902.¹

[22 Stat., p. 58.]

AN ACT to execute certain treaty stipulations relating to Chinese.

Whereas, in the opinion of the Government of the United States, the coming of Chinese laborers to this country endangers the good order of certain localities within the territory thereof; Therefore, *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That from and after the expiration of ninety days next after the passage of this act, and until the expiration of ten years next after the passage of this act, the coming of Chinese laborers to the United States be, and the same is hereby, suspended; and during such suspension it shall not be lawful for any Chinese laborer to come, or, having so come after the expiration of said ninety days, to remain within the United States.

SEC. 2. That the master of any vessel who shall knowingly bring within the United States on such vessel, and land or permit to be landed, any Chinese laborer, from any foreign port or place, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not more than five hundred dollars for each and every such Chinese laborer so brought, and may be also imprisoned for a term not exceeding one year.

SEC. 3. That the two foregoing sections shall not apply to Chinese laborers who were in the United States on the seventeenth day of November, eighteen hundred and eighty, or who shall have come into the same before the expiration of ninety days next after the passage of this act, and who shall produce to such master before going on board such vessel, and shall produce to the collector of the port in the United States at which such vessel shall arrive, the evidence hereinafter in this act required of his being one of the laborers in this section mentioned; nor shall the two foregoing sections apply to the case of any master whose vessel, being bound to a port not within the United States, shall come within the jurisdiction of the United States by reason of being in distress or in stress of weather, or touching at any port of the United States on its voyage to any foreign port or place: *Provided*, That all Chinese laborers brought on such vessel shall depart with the vessel on leaving port.

SEC. 4. That for the purpose of properly identifying Chinese laborers who were in the United States on the seventeenth day of November, eighteen hundred and eighty, or who shall have come into the same before the expiration of ninety days next after the passage of this act, and in order to furnish them with the proper evidence of their right to go from and come to the United States of their free will and accord, as provided by the treaty between the United States and China, dated November seventeenth, eighteen hundred and eighty, the collector of customs of the district from which any such Chinese laborer shall depart from the United States shall, in person or by deputy, go on board each vessel having on board any such Chinese laborer and cleared or about to sail from his district for a foreign port, and on such vessel make a list of all such Chinese laborers, which shall be entered in registry books to be kept for that purpose, in which shall be stated the name, age, occupation, last place of residence, physical marks or peculiarities, and all facts necessary for the identification of each of such Chinese laborers, which books shall be safely kept in the custom-house; and every such Chinese laborer so departing from the United States shall be entitled to, and shall receive, free of any charge or cost upon application therefor from the collector or his deputy, at the time such list is taken, a certificate, signed by the collector or his deputy and attested by his seal of office, in such form as the Secretary of the Treasury shall prescribe, which certificate shall contain a statement of the name, age, occupation, last place of residence, personal description, and facts of identification of the Chinese laborer to whom this certificate is issued, corresponding with the said list and registry in all particulars. In case any Chinese laborer after having received such certificate shall leave such vessel before her departure he shall deliver his certificate to the master of the vessel, and if such Chinese laborer shall fail to return to such vessel before her departure from port the certificate shall be delivered by the master to the collector of customs for cancellation.

The certificate herein provided for shall entitle the Chinese laborer to whom the same is issued to return to and reenter the United States upon producing and delivering the same to the collector of customs of the district at which such Chinese laborer shall seek to reenter; and upon delivery of such certificate by such Chinese laborer to the collector of customs at the time of reentry in the United States, said collector shall cause the same to be filed in the custom-house and duly canceled.

SEC. 5. That any Chinese laborer mentioned in section four of this act being in the United States, and desiring to depart from the United States by land, shall have the right to demand and receive, free of charge or cost, a certificate of identification similar to that provided for in section four of this act to be issued to such Chinese laborers as may desire to leave the United States by water; and it is hereby made the duty of the collector of customs of the district next adjoining the foreign country to which said Chinese laborer desires to go to issue such certificate, free of charge or cost, upon application by such Chinese laborer, and to enter the same upon registry books to be kept by him for the purpose, as provided for in section four of this act.

SEC. 6. That in order to the faithful execution of articles one and two of the treaty in this act before mentioned, every Chinese person other than a laborer who may be entitled by said treaty and this act to come within the United States, and who shall be about to come to the United States, shall be identified as so entitled by the Chinese Government in each case, such identity to be evidenced by a certificate issued under the authority of said Government, which certificate shall be in the English language or (if not in the English language) accompanied by a translation into English, stating such right to come, and which certificate shall state the name, title, or official rank, if any, the age, height, and all physical peculiarities, former and present occupation or profession, and place of residence in China of the person to whom the certificate is issued and that such person is entitled conformably to the treaty in this act mentioned to come within the United States.

Such certificate shall be prima facie evidence of the fact set forth therein, and shall be produced to the collector of customs or his deputy, of the port in the district in the United States at which the person named therein shall arrive.

SEC. 7. That any person who shall knowingly and falsely alter or substitute any name for the name written in such certificate or forge any such certificate, or knowingly utter any forged or fraudulent

¹ Sections 2158-2163 of the Revised Statutes and the act of March 3, 1875 (1 Supp. R. S., 86, ch. 141), prohibit the importation of "coolies" and women for immoral purposes.

² See act approved October 1, 1888, which prohibits the issuance of certificates of identity of Chinese laborers and declares void such certificates issued.

certificate, or falsely personate any person named in any such certificate, shall be deemed guilty of a misdemeanor; and upon conviction thereof shall be fined in a sum not exceeding one thousand dollars, and imprisoned in a penitentiary for a term of not more than five years.

SEC. 8. That the master of any vessel arriving in the United States from any foreign port or place shall, at the same time he delivers a manifest of the cargo, and if there be no cargo, then at the time of making a report of the entry of the vessel pursuant to law, in addition to the other matter required to be reported, and before landing, or permitting to land, any Chinese passengers, deliver and report to the collector of customs of the district in which such vessels shall have arrived a separate list of all Chinese passengers taken on board his vessel at any foreign port or place, and all such passengers on board the vessel at that time.

Such lists shall show the names of such passengers (and if accredited officers of the Chinese Government traveling on the business of that Government, or their servants, with a note of such facts), and the names and other particulars, as shown by their respective certificates; and such list shall be sworn to by the master in the manner required by law in relation to the manifest of the cargo.

Any wilful refusal or neglect of any such master to comply with the provisions of this section shall incur the same penalties and forfeiture as are provided for a refusal or neglect to report and deliver a manifest of the cargo.

SEC. 9. That before any Chinese passengers are landed from any such vessel, the collector or his deputy shall proceed to examine such passengers, comparing the certificates with the list and with the passengers; and no passenger shall be allowed to land in the United States from such vessel in violation of law.

SEC. 10. That every vessel whose master shall knowingly violate any of the provisions of this act shall be deemed forfeited to the United States, and shall be liable to seizure and condemnation in any district of the United States into which such vessel may enter or in which she may be found.

SEC. 11. That any person who shall knowingly bring into or cause to be brought into the United States by land, or who shall knowingly aid or abet the same, or aid or abet the landing in the United States from any vessel of any Chinese person not lawfully entitled to enter the United States, shall be deemed guilty of a misdemeanor, and shall, on conviction thereof, be fined in a sum not exceeding one thousand dollars, and imprisoned for a term not exceeding one year.

SEC. 12. That no Chinese person shall be permitted to enter the United States by land without producing to the proper officer of customs the certificate in this act required of Chinese persons seeking to land from a vessel.

And any Chinese person found unlawfully within the United States shall be caused to be removed therefrom to the country from whence he came, by direction of the President of the United States, and at the cost of the United States, after being brought before some justice, judge, or commissioner of a court of the United States and found to be one not lawfully entitled to be or remain in the United States.

SEC. 13. That this act shall not apply to diplomatic and other officers of the Chinese Government traveling upon the business of that Government, whose credentials shall be taken as equivalent to the certificate in this act mentioned, and shall exempt them and their body and household servants from the provisions of this act as to other Chinese persons.

SEC. 14. That hereafter no State court or court of the United States shall admit Chinese to citizen ship; and all laws in conflict with this act are hereby repealed.

SEC. 15. That the words "Chinese laborers," wherever used in this act, shall be construed to mean both skilled and unskilled laborers and Chinese employed in mining.

Approved, May 6, 1882.

REGULATIONS BASED ON THE EFFECT OF LAWS.

The most complete view available of the operations of the Chinese exclusion laws is contained in the following regulations, issued by the Commissioner-General of Immigration in the form of instructions to inspectors of immigrants.

REGULATIONS.

1. The provisions of law permitting the admission of Chinese persons to the United States and prescribing the classes of Chinese persons entitled to such admission, and the conditions thereof, are as follows:

[Act of July 5, 1884.] The Chinese exclusion act approved July 5, 1884, provided "that from and after the passage of this act, and until the expiration of ten years after the passage of this act, the coming of Chinese laborers to the United States be, and the same is hereby, suspended; and during such suspension it shall not be lawful for any Chinese laborer to come from any foreign port or place, or having so come to remain in the United States."

[Certificate for exempt classes.] 2. Section 6 of said act provides the course to be pursued by Chinese persons, other than laborers, who by treaty or by said act are entitled to come within the United States, and requires that the certificates therein required "shall be produced to the collector of customs of the port in the district in the United States at which the person named thereon shall arrive, and afterwards produced to the proper authorities of the United States whenever lawfully demanded, and shall be the sole evidence permissible on the part of the person so producing the same to establish a right of entry into the United States; but said certificate may be controverted and the facts therein stated disproved by the United States authorities."

Section 12 of said act provides "that no Chinese person shall be permitted to enter the United States by land without producing to the proper officer of customs the certificate in this act required of Chinese persons seeking to land from a vessel."

[Deportation of Chinese.] And directs that any Chinese person found unlawfully in the United States shall be removed therefrom to the country from whence he came, and at the cost of the United States.

[Exclusion act continued until 1902.] Section 1 of "An act to prohibit the coming of Chinese persons into the United States," approved May 5, 1892, continued in force for the period of 10 years from the passage of that act all laws then in force prohibiting and regulating the coming of Chinese into this country.

[Chinese merchants.] 3. Section 2 of the amendatory act, approved November 3, 1893, requires a Chinaman making application for entrance into the United States on the ground that he was formerly engaged in this country as a merchant, to establish, by the testimony of two credible witnesses other than Chinese, the fact that he conducted business as a merchant for at least one year before his departure from the United States.

[Decision of immigrant officer final on deportation.] 4. In the act making appropriations for sundry civil expenses approved August 18, 1884, it is enacted "that in every case where an alien is excluded from admission into the United States under any law or treaty now existing or hereafter made the decision of the appropriate immigrant or customs officers, if adverse to the admission of such alien, shall be final, unless reversed on appeal to the Secretary of the Treasury."

[Treaty with China, 1894.] 5. Article 1 of our treaty of 1894 with China provides that for 10 years the coming of Chinese laborers to the United States shall be absolutely prohibited, except under the conditions specified under said treaty; and article 2 of said treaty provides that the preceding article shall not apply to the return to the United States of any registered Chinese laborer who has a lawful wife, child, or parent in the United States, or property therein of the value of \$1,000, or debts of like amount due him and pending settlement, and further provides that certain things shall be done by a Chinaman before leaving this country, and that he shall be furnished by the collector with such certificate of his right to return under the treaty as the laws of the United States may prescribe, and said article concludes as follows: "And no such Chinese laborer shall be permitted to enter the United States by land or sea without producing to the proper officer of the customs the return certificate herein required."

* * * * *

7. The chief controllers of Chinese immigration at Victoria, Vancouver, and New Westminster, British Columbia, have been authorized to issue to Chinese persons of the exempt class the certificates prescribed by section 6 of the act of July 5, 1884. (S. 20571.)

* * * * *

12. Chinese persons known as "traders" should not be allowed to land in this country, even though they submit the certificate prescribed by section 6 of the act of July 5, 1884. "The true theory is not that all Chinese persons may enter this country who are not forbidden, but that only those are entitled to enter who are expressly allowed." Collectors of customs are directed to admit only Chinese whose occupation or station clearly indicates that they are members of the exempt class of Chinese named in Article III of the treaty with China, viz: "Chinese subjects, being officials, teachers, students, merchants, or travelers for curiosity or pleasure," and to deny admission to Chinese persons described as salesmen, clerks, buyers, bookkeepers, accountants, managers, storekeepers, apprentices, agents, cashiers, physicians, proprietors of restaurants, etc. (Opinion of Attorney-General, July 15, 1898; S. 19677.)

[Wives and children of Chinese.] 13. The wives and minor children of Chinese persons of the exempt class are not required to present, as a condition precedent to landing, the certificate prescribed by section 6 of the act of July 5, 1884, when the fact is established to the satisfaction of the authorities that the person claiming to enter, either as wife or minor child, is in fact the wife or minor child of one of the members of a class mentioned in the treaty as entitled to enter. (Decision of the Supreme Court of the United States, No. 123, October term, 1899; S. 22056.)

* * * * *

[Students.] 15. A Chinese student in China desiring to enter the United States for purposes of study must first obtain the certificate from the Chinese Government, as required by section 6, act of July 5, 1884. (Letter to Mr. E. Van Rensselaer, September 6, 1892.)

* * * * *

17. Chinese who were admitted as students, but without the certificates prescribed by section 6 of the act of July 5, 1884, and on their arrival in this country become laborers, are not entitled to remain in the United States, and should be deported. (United States v. Chiu Chee, 87 Federal Rep., 312; S. 20868.)

[Merchants.] 18. If a Chinese person secures admission to this country as a merchant and soon ceases to be one and becomes a laborer, such fact ought to have a bearing on the intent with which he came here, and if from all the facts of the case it can be determined that he used the former mercantile occupation as a pretext to come here, with the real intent and purpose of laboring only when here, such former occupation would not shield him, even if his certificate of entry be correct in form and substance, and he is not lawfully entitled to be and remain in the United States. (United States v. Yong Yow, 83 Fed. Rep., 832; S. 18575.)

19. Omission from certificates of any of the statements enumerated in the law would seem to be fatal to the sufficiency of the certificate as evidence of the holder's right to enter the United States. (Letter to Attorney-General, September 6, 1892.)

* * * * *

22. A Chinaman claiming to be a merchant and a naturalized citizen of Canada sought admission into the United States without the production of the certificate required by section 6 of the act of July 5, 1884, presenting in lieu thereof, in support of his application for admission, the certificate of naturalization as a British subject and a passport issued by the governor-general of Canada. Upon reference of the subject to the Attorney-General, in an opinion dated January 30, 1895, that officer stated that the certificate before mentioned should be required whether the Chinaman comes direct from China or from some other foreign government of which he may be a subject. He states further that the restrictions and disabilities of the Chinese-exclusion laws are based on moral and racial objections, and not that the Chinese applying for admission to the United States are subjects of the Emperor of China. (Letter to collector at Burlington, February 2, 1895.)

23. A Chinaman, a naturalized citizen of Mexico, who sought admission to this country upon the ground of his affiliation with the Mexican Government was excluded in accordance with the opinion of the Attorney-General dated January 30, 1895. (Letter to Secretary of State, April 20, 1896.)

* * * * *

26. The treaty with China promulgated December 8, 1894, does not waive the requirement that Chinese merchants and others of the exempt class shall present at the port of first arrival the certificate provided by section 6 of the act approved July 5, 1884. (Letter of Secretary of State, September 24, 1894.)

* * * * *

31. Chinese merchants who desire to enter for the first time the United States must present the certificate required by law. The privilege of entry without certificate is accorded those merchants only who have been formerly merchants resident in the United States. (Letter to Mr. D. McCormick, December 8, 1892.)

32. Section 2 of the act of November 3, 1893, defines a merchant to be "a person engaged in buying and selling merchandise, at a fixed place of business, whose business is conducted in his name."

35. A Chinese person who has clandestinely entered this country can not acquire a right to remain here or to return to the United States by qualifying himself as a merchant. (Opinion of Solicitor of Treasury, March 30, 1896, 8, 29043.)

36. The practice of requiring Chinese merchants or other Chinese persons returning to this country to present evidence of their right to enter the United States to the collector or deputy collector of customs in the district to which admission is desired is based upon section 9 of the act of May 6, 1882, and the clause in the act of August 18, 1894, which makes final the decision of the appropriate customs or immigration officer if adverse to the admission of alien, etc., unless reversed on appeal to the Secretary of the Treasury. (Opinion of Solicitor of Treasury, February 6, 1896; letter to collector at Burlington, February 18, 1896.)

38. In view of the many cases of hardship due to delays in the investigation and consideration of cases of Chinese persons seeking admission to the United States as alleged returning merchants, and on account of the many fraudulent cases of this character, any Chinese person who may hereafter leave this country with the intention of seeking readmission as an alleged returning merchant under the provisions of section 2 of the act of November 3, 1893, should transmit to the collector of customs at the port from which such Chinese person intends to depart from the United States, at least 30 days before his departure from this country, duplicates of the affidavits of witnesses other than Chinese, setting forth the facts prescribed by the statute referred to upon which he intends to base his application for readmission. Upon the receipt of such duplicates the collector at such port of departure will promptly transmit them to the collector of customs, special agent, or other officer of this Department at or nearest to the place in which such Chinese person claims to have been engaged as merchant, for investigation and report. After the receipt of such report, and upon the personal application and proper identification of such Chinese person, the collector at the point of departure may indorse upon the original papers presented by such Chinese person a statement, over his official signature, to the effect that the right of such Chinese person to return to the United States has been *prima facie* determined, subject to his proper identification by and the presentation of such original papers to said collector upon his return to this country; and upon the return of such Chinese person to said port of departure, the collector may, in his discretion, admit him to this country without further delay.

While Chinese persons seeking admission as returning merchants can not be excluded upon the ground that they have failed to comply with the foregoing regulations, such failure on the part of those leaving the country after this date would be a fact exciting suspicion and discrediting to the application for readmission, and the regulation heretofore issued will govern the procedure in such cases. (Department Circular No. 28, March 3, 1900.)

[Registered Chinese laborers.]—41. A Chinese person claiming the right to be permitted to leave the United States and return thereto as a duly registered laborer shall apply in person to the collector of customs for the district in which he resides at least a month prior to the time of his departure; shall deposit with said collector a certificate of registration from the internal-revenue collector for the district in which he resided at the time of registration; and shall make an oath before the said collector, in writing, full statement descriptive of his family, or property, or debts, as the case may be, and fully describing himself, giving his name, age, height, local residence, occupation, color of eyes and complexion, and distinguishing marks, if any, and naming the port from which he expects to depart from the United States, which shall be one of those designated in paragraph 42. Such written description shall be filed in duplicate, and to each shall be permanently attached a photograph of the Chinese person referred to therein. The collector of customs, or his deputy, with whom such certificate of registration and written description are filed will make a thorough examination to ascertain whether the applicant is registered and as to the accuracy of the descriptive statement; that the photograph accompanying the latter for the purpose of identification is that of the person described in such certificate and statement, and that his height, weight, and descriptive physical marks are accurately given, and will then write his official signature in part across such photograph and in part upon the adjoining portion of the written descriptive statement to prevent substitution. The collector referred to will then transmit the certificate of registration to the internal-revenue collector by whom the same purports to have been issued for comparison with the record thereof in his office, in respect not only to name and date therein, but in all other particulars. At the same time the collector of customs will in person or through the special agent for the district make thorough investigation as to the facts stated therein. As soon as practicable thereafter the collector of customs referred to will transmit such registration certificate, one copy of the sworn statement, and the reports of investigation to the collector of customs for the district from which such Chinese laborer intends to depart from the United States, and at the same time will transmit to said Chinese laborer the duplicate copy of such sworn statement, with instructions to present the same in person to the collector of customs or his deputy at the port of departure. Upon the receipt of such certificate of registration, the duplicate copies of said sworn statement, and the reports of investigation, the collector of customs or his deputy at said port of departure, after one month from the date of the filing of the original application in the office of the collector of the district in which such Chinese laborer resides, if he finds that the person presenting such duplicate statement is the Chinese person therein described, and is entitled thereto, may sign and give to such person, on his departure from said port, a certificate containing the number of the description referred to in the following form:

CERTIFICATE ISSUED TO CHINESE LABORERS.

UNITED STATES OF AMERICA.

Certificate issued to Chinese laborer departing from the United States with the intention of returning thereto under the treaty between the United States of America and the Empire of China signed March 17, 1894, and proclaimed by the President of the United States December 8, 1894.

This is to certify that —, a Chinese laborer, described in identification paper numbered —, port of —, departed from this port for — on this — day of —, 19—, with the intention of returning to the United States via this port within twelve months from said date.

Given under my hand and seal this — day of —, 19—, at —, State of —.

[COLLECTOR'S SEAL.]

Collector of Customs, Port of —, District of —.

If the last-named certificate be transferred, it shall become void, and the person to whom it was given by the collector shall forfeit his right to return to the United States.

The certified description should be carefully preserved by the collector at the port of exit as a means of identification of the Chinese person therein mentioned, and who, in order to avail himself of the

privilege conferred by said article 2 of the treaty, must return via the port of departure within one year from the date of his leaving the United States, unless prevented by sickness or other disability beyond his control, in which event the facts shall be officially certified by the Chinese consul at said port of departure to the satisfaction of the collector of the port at which such Chinese subject shall land in the United States.

42. No Chinese person shall be permitted to enter the United States without producing to the collector of customs or his deputy at the port of such entry the return certificate herein required. A Chinese laborer, possessing a return certificate in the form prescribed above, shall be admitted to the United States only at the port from which he departed therefrom, and no Chinese person, except Chinese diplomatic or consular officers and their attendants, shall be permitted to enter the United States except at the ports of San Francisco, Portland, Oreg., Boston, New York, New Orleans, Port Townsend, Richford, St. Albans, Plattsburg, Niagara Falls, Buffalo, Key West, Tampa, Mobile, Eagle Pass, Laredo, El Paso, Nogales, San Diego, Astoria, Pembina, and Honolulu.

43. The collector at the port of departure shall send a copy of the certified description, with photograph of the person therein named attached, and also one of the stubs hereinafter referred to, to the Department; said stub and said copy of the certified description shall be filed together.

Certificates as above described, with a serial number attached, will be issued to collectors of customs at ports from which Chinese depart, upon application therefor to the Department. In all instances collectors will fill out the blanks on the stubs of the certificates. Collectors of customs will submit reports to the Department weekly of Chinese persons departing from and returning to their respective ports under the treaty herein referred to, debiting themselves with the number of certificates received from the Department, crediting themselves with the number used, and reporting the number remaining on hand. The collector shall cancel all certificates presented on admission of returning Chinese, and forward said certificates so canceled to the Department. Collectors will also make weekly report of Chinese persons seeking admission into the United States through their ports, giving the names, description, occupation, and places of destination in the United States of those admitted, including the names of firms to which alleged returning merchants claim to belong, and the evidence upon which such action is based, and also the names, description, and occupation of those to whom admission is refused, and the reason for such refusal, also the names, description, and occupation of such persons permitted to land for transit through the United States. (S. 14188.)

[Penalty on master of vessel].—45. If the master of any vessel shall knowingly bring within the United States on such vessel and land, or attempt to land, or permit to be landed, any Chinese laborer or other Chinese person, in contravention of law, the facts relating thereto shall be promptly reported to the proper United States attorney for the enforcement of the provisions of section 9 of the act of September 13, 1888. Chinese laborers or persons on board such vessel must depart with the vessel on leaving port.

46. Three registered Chinese laborers who left the United States for Bluefields, Nicaragua, but who, being shipwrecked on the voyage, decided to return to the United States, were refused the right to readmission for the reason that upon departing from this country they failed to comply with the provisions of article 2 of the treaty with China promulgated December 8, 1894, in that they did not deposit with the collector of customs at the port of departure the papers required by said treaty. (Letter to Representative Meyer, May 27, 1895.)

49. Upon the issuance of the prescribed certificate to a registered Chinese laborer who departs from the United States with the intention of returning thereto, the collector of customs at the place of residence of such laborer, or a special agent of the Department, may be requested to ascertain and report whether or not the statements made by such laborer are true, and if in any instance it should be found that such statements are false, the person to whom the certificate may be issued should be denied admission to this country upon his return. (S. 17532.)

54. Certificates of registration granted to Chinese laborers will not be regarded as sufficient evidence of the right of such persons to depart from the United States and return thereto. Such certificates are intended to be issued to Chinese laborers domiciled in the United States, in order that the holders thereof may be protected from arrest and deportation. (Letter to Mr. Hall, April 24, 1893, and to Miss Saunders, April 3, 1893.)

This Department has decided that laundrymen are laborers within the meaning of this act, and that the fact that a laundryman has accumulated capital and has become an employer of laborers in the same business does not change his status as a laborer.

60. A Chinese harbor domiciled in the United States is classified as a laborer. (Letter to Mr. John T. Dewees, November 6, 1893.)

62. Chinese laborers who go out of the country under the provisions of the recent treaty with China, promulgated December 8, 1894, can not be permitted upon return to bring their wives with them. The wife partakes of her husband's status as a laborer, and as such is barred admission by law. (Opinion Solicitor of Treasury, February 7, 1896; letter to collector, Burlington, February 11, 1896.)

63. Registered Chinese laborers who depart from the United States with the intention of returning, but who fail to obtain the certificate prescribed by Article II of the treaty with China for use in such cases, should not be allowed to return to this country. (Opinion of Attorney-General, October 11, 1896; S. 17458.)

Chinese persons should not be admitted upon the presentation of passports issued by the Secretary of State. (S. 21212; in re Gee Hop, 71 Federal Rep., 274.)

69. Under advice of the United States Attorney-General and the Solicitor of the Treasury, Chinese laborers may pass through the United States in transit to foreign countries under certain conditions, viz:

- (a) That they have through tickets across the whole territory of the United States;
- (b) That the collector of customs at port of arrival is satisfied of their good faith, and prepares and forwards to collector at port of exit descriptive lists; and
- (c) That the collector at first port takes a bond in a penal sum of not less than \$500 from each person, conditioned for his transit and departure from United States. (S. 21162.)
- (d) Bonds given for the transit of Chinese through the United States must require the sureties to produce to the collector of customs to whom such bonds may be given certificates from the collector at

the port of exit, showing that within twenty days from the dates of the arrival the Chinese persons named in the bonds have departed actually from the country. (S. 17201.)

(e) Chinese who apply for admission to the United States, but who are refused such admission, can not pass through the United States in transit under bond, but must be returned to the country whence they came. (Opinion of Solicitor of Treasury, September 21, 1900.)

The privilege of transit under bond of Chinese laborers through the United States is recognized and agreed to in Article III of the treaty with China promulgated December 8, 1894. (See Article III of treaty with China.)

71. In the preparation of descriptive lists of Chinese laborers in transit their height should be ascertained with accuracy, and for this purpose the shoes of Chinese should be removed while being measured. (Letter to collector, New York, March 25, 1896.)

74. Chinese servants employed in the United States Navy on board war vessels, the same having been enlisted at foreign ports, can not land in the United States. (Letter to the Secretary of the Navy, August 1, 1889; S. 9547.)

75. Chinese cooks and stewards shipped at foreign ports on American vessels can not land in the United States. (Letter to collector, Port Townsend, March 7, 1890; S. 8900.)

77. In the case of the United States *v. Wong Kim Ark* the Supreme Court has decided that children born in this country of Chinese parents are of right citizens of the United States. (S. 19180.)

81. State courts have no jurisdiction in the Chinese cases. A United States judge alone has the power, under section 6 of the act of May 5, 1892, to order the deportation to China of a Chinese laborer who has failed to register as required by the acts of May 5, 1892, and November 3, 1893.

A United States commissioner, *inter alia*, has the power, under section 12 of the act of July 5, 1884, and section 13 of the act of September 13, 1888, to order the deportation of a Chinese prisoner found to be unlawfully within the United States. (Letter to collector, El Paso, September 20, 1893.)

82. Upon refusal of the collector of customs at San Francisco to permit the landing at his port of one Lem Moon Sing, a returning merchant, application for a writ of habeas corpus was made to the Supreme Court. In an opinion of that court rendered May 27, 1895, the application was denied upon the ground that the act of August 18, 1894 (sundry civil appropriation), makes final the decision of the appropriate customs or immigration officer, if adverse to the admission of an alien, unless reversed on appeal to the Secretary of the Treasury. Under this law the right to review the action of collectors of customs in refusing the application of Chinese persons for permission to land is taken away from the court and vested in the Secretary of the Treasury. (Lem Moon Sing *v. United States*, opinion Supreme Court, May 27, 1895.)

83. The court has not authority, by writ of habeas corpus or otherwise, to review the decision of a collector of customs, sustained on appeal to the Secretary of the Treasury, denying admission to an alleged returning Chinese merchant, and has no jurisdiction to determine the question whether or not the petitioner offered to the collector the proof that he was a merchant. (In re Leong Yung Tong, 90 Federal Rep., 648; S. 20478. See also 143 U. S., 660; 149 U. S., 713.)

84. A decision of the collector, denying the right to enter, affirmed by the Secretary of the Treasury, will not be reviewed by the courts on writ of habeas corpus on the ground of irregularities in taking the testimony. (In re Jew Wong Loy, 91 Federal Rep., 240.)

85. It was held by the Supreme Court that the act of May 5, 1892, obliging all Chinese residents to register under penalty of arrest and deportation was constitutional. (Fong Yue Ting *v. United States*, 149 U. S., 698.)

87. When Chinese are found in this country who are unable to produce the certificate of registration prescribed by law for laborers, or evidence of their status as bona fide merchants engaged in business in this country, or certified by the form prescribed by section 6 of the act of July 5, 1884, indorsed by a collector of customs with the fact and date of their admission into the United States, they shall be reported to the proper legal authorities for the determination of the right of such persons to remain in the country. (S. 18286.)

90. Officers of railroads by which Chinese persons are illegally brought to places in the United States are liable to the penalties imposed by section 11 of the act of July 5, 1884, and should be reported to the United States attorney for prosecution.

Inspection of persons and papers should be made at the border of contiguous foreign territory, so as to prevent the entrance of Chinese persons excluded by law. (Letter to collector, Burlington, Vt., December 10, 1891, S. 12167.)

91. The importation of opium into the United States is forbidden to Chinese subjects under article 2 of the treaty with China, proclaimed October 5, 1881, and all opium so imported should be seized and forfeited. (Letter to collector, San Francisco, April 28, 1892; S. 12616.)

JAPANESE.

The following account is taken from a report issued by Special Agent W. M. Rice, who, under instructions from the Commissioner-General of Immigration, visited Japan in 1899 and reported upon the causes inducing emigration from that country. The following extracts from his report relate mainly to the Japanese emigration companies:

Inasmuch as the Government claims the perpetual allegiance of its subject, it grants a passport, limited to 3 years, and I was informed that a large part of the emigrants who thus go abroad return to their native land sooner or later, and consequently few Japanese, and indeed I may say none, come to the United States with a view to remaining or making homes, the theory of their emigration system being for the promotion of emigration as an educational process and money-making investment for a temporary period, the profits of which accrue jointly to the promoter and to the emigrant, the Japanese Empire being the recipient of what may be described as the unearned increment through its people that thus go abroad, through their contact with more enlightened people and by reason of the accumulated capital, which they return to their native land. It is through the tenacious allegiance which the subjects of Japan yield to their sovereign that the promotion of emigration becomes a reasonably safe business.

It is a feature of the construction of the Japanese law regulating emigration (see regulations, Exhibit No. 1) that in providing the same the Government has acted upon the theory that the character of the Japanese abroad will be taken as an index of the character of the nation at home. Hence these regulations provide for the careful inquiry into the character of those going abroad and also require that provision shall be made for the return of the emigrant, in the event that he becomes sick, or a public charge in a foreign country, before passports are granted. These features of the Japanese law regulating emigration and the granting of passports are very well in themselves, provided they were honestly enforced, and provided the Japanese people stood on an equal footing with the people of the United States in a moral, economical, and educational sense, especially as to the value of their labor. Making the act of emigration, in the nature of things, purely voluntary they would be highly commendable, but there is an abundance of evidence going to show that the average Japanese official and policeman, who practically pass upon the qualifications of emigrants, is but little superior, if any, in point of morals, to the average cooly farmer. Consequently the performance of their duties is at most perfunctory, while the possibility of gain through the emigration companies, of which I shall hereafter treat, renders their investigations and reports of little value.

Upon this point I was informed by various persons it is desirable for the emigrant to go under the auspices of the emigration companies, because these companies smooth the way with the officials and, in some say, are influential. The emigration companies seem to be attached to the system to which I have above alluded by the laws making provision for their organization. They are designated in Japanese "imin toriatokukin," and are authorized to make provision for the assisting of the emigrants abroad, provide security for the emigrants' care abroad required by the law, and return in case of sickness or indigence, and in the performance of these services they engage in furnishing contract labor to such countries as permit it, and otherwise contract with the emigrants for the services to be performed by them of a personal character. For such services they receive from the emigrant certain fees, ranging from 10 to 20 yen per capita.

These companies were first organized as ordinary partnerships, but later were brought under the control of the Government, and are now operating under the law described, enacted in the twentieth year of Meiji (1896). (See Exhibit No. 1.) In general these companies, of which there are 12 in all (one new one having been organized while I was in Japan, to wit, the Okayama Emigration Company) are required by the Government to deposit certain moneys as a guaranty that the business transacted shall be strictly in accordance with the provisions of the imperial ordinance, the agents located abroad being subject to the approval of the Government. They have an aggregate capital stock of 558,999 yen (\$280,000), distributed as follows:

Name of company.	Place of business.	Capital stock.
		Yen.
Kobe Toko Co	Kobe	30,000
Nippon Kissa Emigration Co	Tokyo	100,000
Kaigwai Toko Co	Hiroshima	60,000
Shin Morioka	Tokyo	8,000
Nippon Emigration Co	Kobe	50,000
Kyushu Emigration Co	Kumamoto	50,000
Tokyo Emigration Co	Yokohama	20,000
Do	Tokyo	100,000
Kosei Emigration Co	Wakayama	50,000
Kumamoto Emigration Co	Kumamoto	40,000
Imperial Colonial Co	Okayama	30,000
Okayama (new company; capital stock unknown)	do	

Six of these companies have agents in the United States and Canada, as follows:

Company.	Agent.	Residence.
Kobe Toko Co	Takijiro Shinobe	San Jose, Cal.
Nippon Emigration Co	Tamichi Takaya	San Francisco, Cal.
Kaigwai Toko Co	Kisuke Humano	Do.
Shin Morioka	Tamichi Takaya	Do.
Kosei Emigration Co	Tekichi Nishihata	Vancouver, British Columbia (Col. ave.).
Kaigwai Toko Co	do	Do.
Kosei Emigration Co	do	Do.
Kyushu Emigration Co	Kwanichi Kayashi	Vancouver, British Columbia.
Nippon Emigration Co	Masataro Mito	At or in the neighborhood of Victoria, British Columbia.
Hiroshima Emigration Co	Minama Jinnozu	San Francisco, Cal., 529½ Geary street.
Kosei Emigration Co	Y. Nishibata	San Francisco, Cal., 200½ Brannan street.

These companies have offices at all important emigration centers, but at the present time Hiroshima seems to be the chief center of operations, I having found 9 branches in that city. The character of the organization maintained by these emigration companies for business and political purposes may be inferred from the fact that in Tokyo they have an association of emigration companies located at Yamashiro cho (street or line) called Kyobashi, which is in the nature of an emigration board of trade. The offices of these companies are well equipped for business purposes, and have the appearance of being well supplied with employees and clerks. The managers and stockholders are among the leading business men and politicians of Japan, and are a formidable power when cooperating together. Among the capitalists and politicians thus interested is Mr. Suguwara, who is a member of the lower House of Parliament and editor of the Jimm, the leading vernacular newspaper of Japan, published at Tokyo. Mr. Suguwara spent several years in Idaho, where he had extensive connection with railway contractors, and, presumably, laid the foundation of his fortune. I met others connected with

these companies, whose appearance showed them to be men of position, and I was informed at Hiroshima that the gentlemen I met there were among the leading capitalists of that city.

I find that the emigration companies all advertise, more or less, in the newspapers for contract laborers, designating them to go to Hawaii, Peru, and Mexico, and that in a general way they advertise through circulars, pamphlets, and by means of traveling solicitors for emigrants going to the United States.

In fact, the evidence herewith presented, and all circumstances connected therewith and which fell under my observation, tend to show and, in my opinion, establish beyond a reasonable doubt that the capitalists interested in these companies have taken advantage of the law for the protection of emigrants to build thereon a system which has no parallel. The system presents an interesting study in the linking together of money-making enterprises, which must obtain their profit through a common source. Agents of the steamship companies and emigration companies do not occupy offices together. They are, nevertheless, connected very closely through the brokers and hotel keepers, and it is hard to draw a line of separation of interests. Many of the hotel keepers are emigration brokers, and nearly all brokers are intimately connected with the emigration companies, while it is safe to assert that if the steamship companies were to establish and maintain a fixed rate for steerage passage, it would cut the profits of the brokers, hotel keepers, and emigration companies 50 per cent, and it seems to me conclusive that if it were not for the existence of the emigration companies and these agencies for the collection of emigrants to go abroad, the profits of the steamship companies would be materially reduced. By their present methods, the steamship companies, whether intentionally or otherwise, clearly offer inducements for the emigration companies to solicit the emigrants, both being largely capitalized enterprises that have a mutual interest, which is inseparable, as long as they are allowed to exist side by side, the one to obtain fees from emigrants and the other to receive steerage passage.

The emigration company is exploited as a beneficiary institution and a similar argument is made in their favor by high officials of the Japanese Government, but if any number worth mentioning has been returned to Japan by the emigration companies, I have been unable to discover the fact. However, if the term "beneficiary" is made to apply to the filling of the pockets of the stockholders of the emigration companies and others interested in the movements of emigrants, and to the fact that the system affords a splendid means for getting rid of a congested population, then in that sense it is eminently beneficiary, because it is a matter of general repute that they are the most profitable enterprises in Japan. Great stress was laid by Japanese officials with whom I conversed upon the fact that the Japanese Government requires every emigrant to provide sureties to provide for his return to the country in case of need, before granting a passport. This fact is pointed out by a Mr. Shimamura.

The system may be a benefit to Japan, but I deny that it is any advantage to other countries. The aged and decrepit can not emigrate, and the percentage of those who do and become paupers amounts to nothing. This is shown by practical experience, while, on the other hand, their laws are so strict that they defeat their own purposes. It is a well-known fact in Japan, and clearly appears in nearly all the exhibits hereto attached, that it was the difficulty experienced by the coolie class in obtaining sureties and obtaining passports that suggested and built up the emigration companies. There are really no fixed rates of Japanese steerage, so that the steamship companies, if not voluntary parties to the system described, are made involuntary contributors to the emigration companies and emigration brokers. * * *

I talked with many men of long experience in Japan and found but one universal opinion—that not 10 per cent of the emigrants leaving that country could or would go unless they had assistance, or were helped or assisted by some person of influence. Aside from the facts herein presented, the coolie class could find no proper sureties, such as are required by the Government, unless some arrangement was provided for responsible parties for looking after this class of emigration after they land in the United States.

The magnitude of the capital invested, requiring the utmost energy and most aggressive management to make it profitable, which, considered with the zeal, begotten of competition, between the emigration companies, and the influence of wealth and political connection, points to but one conclusion. Consequently, I am forced to the conclusion that the Japanese system of granting passports for a limited period, requiring surety for the welfare of the emigrant abroad, and, in some cases, for the care of his family while absent and his return when sick or disabled, joined with the avarice of organized capital and influence of the emigration companies, is the direct inducing cause of 90 per cent of the emigration from Japan to the United States. * * *

I find, further, owing to the conditions herein described, that the objects and purposes of the laws of the United States regulating immigration are largely defeated so far as related to immigration from Japan. It may readily be perceived that such an organized system, having its feeders among ticket brokers and hotel keepers, joined by ties of interest, and from employment bureaus in Japan and on the Pacific coast, and by reason of its capital and power able to coerce the steamship companies into dividing their profits, with a perfect system of coaching immigrants as to the requirements of the immigration laws of the United States, that the immigration officers here are practically powerless to hold back the influx of pauper and contract labor from Japan, which is increasing year by year.

H. IMMIGRATION THROUGH CANADA.

In proportion to the efficiency of the inspection and deportation of immigrants at the seaports of the United States, immigrants from Europe and Asia, apprehensive of the examination at these ports naturally seek entrance to the United States through the ports of other countries not subject to American jurisdiction. In this way Canada especially has become, as it were, a back door for foreigners who can not find entrance by the more direct route. To a considerable extent Mexico also is a means of ingress for the excluded classes from Asia. Foreigners enter the United States through Canada under two conditions:

First. Those who come to the Canadian ports with tickets through to the United States; second, those manifested to Canadian interior points, intending to cross over to the United States. By either of these methods the immigration through Canada has increased in remarkable proportions, and Canada has come to be understood in foreign countries as an easy route for evading the immigration inspectors of the United States. One of the special agents of the Bureau of Immigration, after inquiry in Europe, makes the following statement (see Report Commissioner-General of Immigration, 1898, p. 38): "It is the popular belief in provincial England that those who are not beyond doubt outside of the prohibited classes can pass muster by evasion and reservation when being examined by the United States immigration inspectors; and when evasion and reservation are not considered quite effective there is always a way open via Canada. Indeed, one energetic agent boldly declared that anyone who really wanted to go to America could scarcely be kept out, no matter how vigilant the United States immigrant authorities may be."

The two methods of access to the United States through Canada, above mentioned, present different problems, and may be considered separately:

1. *Immigrants to Canadian seaports.*—Prior to October 7, 1893, there is no record of the number of immigrants destined for the United States who landed at Canadian ports. The only points of inspection for such immigrants were the stations along the Canadian border, and large numbers of immigrants doubtless escaped inspection by entering clandestinely at the points where inspectors were not stationed. After fruitless negotiations with the Canadian government in order to secure their cooperation in meeting these difficulties, an agreement was finally made in October, 1893, by the Superintendent of Immigration with the steamship companies and the railroad companies. This agreement, though not officially sanctioned by the Canadian government, has nevertheless been allowed to stand without interference or protest. Under its terms the steamship companies agree to admit the inspectors of the United States to their property at those Canadian ports already designated by the Canadian government. The companies agree to give the inspectors facilities in the way of accommodations, access to the immigrants, and to keep the immigrants apart from the public until after inspection shall be completed. The inspectors thereupon furnish a certificate or passport containing a personal description of those immigrants deemed eligible for entrance to the United States, signed by the inspector. This certificate entitles the immigrant to enter the United States without further examination or hindrance, and is accepted on its face by the inspectors at the ports of entry on the American side. Following is a copy of immigrants' certificate:

Certificate granted to immigrant at Canadian port.

This is to certify that _____, a native of _____, who arrived at the port of _____, per steamship _____, on the _____ day of _____, has been duly inspected and registered and will be admitted into the United States upon presentation and surrender of this certificate to any custom or immigration officer at the _____. His description is as follows: Age, _____; height, _____; color of hair _____; color of eyes, _____.

Remarks: _____.

Commissioner of Immigration.

The railroad companies, being also parties to this agreement, contract not to sell to any immigrant to any port of the United States a ticket for his transportation or to transport him in cars or vessels from a port of entry until after he has exhibited his certificate or passport; and they agree also not knowingly to transport any rejected or undesirable immigrant, or one who is by law prohibited from entering the United States, into its territory. This provision is largely a dead letter, not through the fault of the railroad companies, but through various subterfuges, such as purchase of tickets by third parties, etc. The steamship companies also agree to pay the inspection officer at the port of landing the head tax for each eligible immigrant. Under this agreement the Secretary of the Treasury designated the ports of Halifax,

these companies, whose appearance showed them to be men of position, and I was informed at Hiroshima that the gentlemen I met there were among the leading capitalists of that city.

I find that the emigration companies all advertise, more or less, in the newspapers for contract laborers, designating them to go to Hawaii, Peru, and Mexico, and that in a general way they advertise through circulars, pamphlets, and by means of traveling solicitors for emigrants going to the United States.

In fact, the evidence herewith presented, and all circumstances connected therewith and which fell under my observation, tend to show and, in my opinion, establish beyond a reasonable doubt that the capitalists interested in these companies have taken advantage of the law for the protection of emigrants to build thereon a system which has no parallel. The system presents an interesting study in the linking together of money-making enterprises, which must obtain their profit through a common source. Agents of the steamship companies and emigration companies do not occupy offices together. They are, nevertheless, connected very closely through the brokers and hotel keepers, and it is hard to draw a line of separation of interests. Many of the hotel keepers are emigration brokers, and nearly all brokers are intimately connected with the emigration companies, while it is safe to assert that if the steamship companies were to establish and maintain a fixed rate for steerage passage, it would cut the profits of the brokers, hotel keepers, and emigration companies 50 per cent, and it seems to me conclusive that if it were not for the existence of the emigration companies and these agencies for the collection of emigrants to go abroad, the profits of the steamship companies would be materially reduced. By their present methods, the steamship companies, whether intentionally or otherwise, clearly offer inducements for the emigration companies to solicit the emigrants, both being largely capitalized enterprises that have a mutual interest, which is inseparable, as long as they are allowed to exist side by side, the one to obtain fees from emigrants and the other to receive steerage passage.

The emigration company is exploited as a beneficiary institution and a similar argument is made in their favor by high officials of the Japanese Government, but if any number worth mentioning has been returned to Japan by the emigration companies, I have been unable to discover the fact. However, if the term "beneficiary" is made to apply to the filling of the pockets of the stockholders of the emigration companies and others interested in the movements of emigrants, and to the fact that the system affords a splendid means for getting rid of a congested population, then in that sense it is eminently beneficiary, because it is a matter of general repute that they are the most profitable enterprises in Japan. Great stress was laid by Japanese officials with whom I conversed upon the fact that the Japanese Government requires every emigrant to provide sureties to provide for his return to the country in case of need, before granting a passport. This fact is pointed out by a Mr. Shimamura.

The system may be a benefit to Japan, but I deny that it is any advantage to other countries. I talked with many men of long experience in Japan and found but one universal opinion—that not 10 per cent of the emigrants leaving that country could or would go unless they had assistance, or were helped or assisted by some person of influence. Aside from the facts herein presented, the coolie class could find no proper sureties, such as are required by the Government, unless some arrangement was provided for responsible parties for looking after this class of emigration after they land in the United States.

The magnitude of the capital invested, requiring the utmost energy and most aggressive management to make it profitable, which, considered with the zeal, begotten of competition, between the emigration companies, and the influence of wealth and political connection, points to but one conclusion. Consequently, I am forced to the conclusion that the Japanese system of granting passports for a limited period, requiring surety for the welfare of the emigrant abroad, and, in some cases, for the care of his family while absent and his return when sick or disabled, joined with the avarice of organized capital and influence of the emigration companies, is the direct inducing cause of 90 per cent of the emigration from Japan to the United States. * * *

I find, further, owing to the conditions herein described, that the objects and purposes of the laws of the United States regulating immigration are largely defeated so far as related to immigration from Japan. It may readily be perceived that such an organized system, having its feeders among ticket brokers and hotel keepers, joined by ties of interest, and from employment bureaus in Japan and on the Pacific coast, and by reason of its capital and power able to coerce the steamship companies into dividing their profits, with a perfect system of coaching immigrants as to the requirements of the immigration laws of the United States, that the immigration officers here are practically powerless to hold back the influx of pauper and contract labor from Japan, which is increasing year by year.

to the United States during these ten years 346,360 foreigners. On the basis of this computation it will be seen that Mr. Charlton estimated that the number of foreigners crossing through Canada into the United States from 1871 to 1881 amounted to an average of 18,482 per year, and the number crossing over from 1881 to 1890 averaged 34,636 per year. This number is largely in excess of the number who come to the ports of Canada manifested openly to the United States.

The character of this surreptitious immigration through Canada is believed to be the worst of all that enters the United States. Mr. Powderly asserts (reports, vol. 15, p. 38) that in his opinion the greater part of the infirm people that come to us, aliens that drift into our institutions, come by way of Canada. Speaking of diseased immigrants, (Report of Commissioner-General, 1900, p. 40) he states that "experience shows that in the past the citizens of this country have not secured the full benefit from this effective physical inspection, because of the practice which has grown up of sending diseased immigrants to Canada manifested to ports in the Dominion, hoping thereby to secure their admittance to the United States. If the Dominion government would undertake such legislation as would prohibit the landing of the diseased, the pauper, and the criminal at Canadian ports, the door would be directly closed against the admission of such aliens to the United States."

The Canadian agreement of May 5, 1896, provided for the identification and collection of head tax upon immigrants who, though actually destined to the United States, attempt to evade payment by purchasing tickets to some point in Canada. The transportation companies agreed in such cases to return to as remote a point from our borders as he is willing to go, any alien who attempts within 30 days after being refused a certificate to enter this country. The essential weakness of this provision lies in the fact that the American Government can not send its officers in company with the immigrant across the territory of Canada, nor can it compel the immigrant to take passage from a Canadian port to European countries whence he came. The willingness of the immigrant is the sole basis of deportation. Consequently, the inspectors along the Canadian border are able only to see that the immigrant is taken back to the Canadian side, whence it is an easy matter for him to find access at some point where inspectors are not stationed. Quite recently the Bureau of Immigration has adopted the new policy of carrying these rejected immigrants directly to the port of New York without going through Canada, and then sending them back to their European countries, and paying the expenses out of the immigrant fund.

INSPECTION AT EUROPEAN PORTS.

So serious has become the evasion of the immigration laws through the Canadian transit that the Bureau of Immigration has in the past 2 or 3 years made special efforts to investigate the conditions under which immigrants embark to this country, and also to provide such consular inspection, and especially medical inspection, at foreign ports as the steamship companies would consent to admit. The reports of these officials to the Bureau of Immigration contain striking testimony to the conclusions already reached in the foregoing pages, and certain of the more detailed communications from these officials are given herewith.

The first is a report made by Special Agent Robert Watchorn, detailed in 1898 to visit Liverpool, Bremen, and Hamburg in order to examine into the methods of embarkation. Following this report is a statement made by the United States consul at Liverpool, explaining the recent attempt of the Bureau of Immigration to provide a medical inspection at Liverpool of immigrants coming to the United States through Canada. Seeing that this inspection depended solely upon the consent and cooperation of the steamship companies and had no legal binding force, it has proven an entire failure and even a disadvantage in the enforcement of the immigration laws, as will be seen in the statements of the letters themselves.

Next is a series of occasional reports made by Dr. Anderson, surgeon in the Marine-Hospital *Se vice*, detailed at Liverpool for the examination of immigrants. His reports contain conclusive testimony to the evasions of the United States laws. Finally, a communication is submitted from Dr. Heiser, stationed at Quebec for the inspection of immigrants destined for the United States.

REPORT OF SPECIAL AGENT ROBERT WATCHORN RELATING TO INSPECTION OF EMIGRANTS AT EUROPEAN PORTS.

In June, 1898, the Commissioner of Immigration directed Special Agent Robert Watchorn to make an investigation in Europe on the diversion from United States to Canadian ports of undesirable immigrants and the immigration of paupers and criminals at the expense of foreign charities. The report made by Mr. Watchorn is reproduced herewith in its more important parts:

In June, 1898, the Commissioner of Immigration directed Special Agent Robert Watchorn to make an investigation in Europe on the diversion of undesirable immigrants from United States to Canadian

ports and the immigration of paupers and criminals at the expense of foreign charities. The report made by Mr. Watchorn is reproduced herewith in its more important parts:

* * * A call at any of the principal trans-Atlantic ticket offices is quite sufficient to demonstrate that the British "board of trade" compels all ticket agents to acquaint steerage emigrants with the full text of the immigration laws of the respective countries to which emigrants are desirous of going. Not only is a large copy of the immigration laws of the United States prominently displayed in every ticket office, but every intending emigrant is compelled under oath to answer all the questions contained on steerage manifest sheets, and is given solemn warning that if any discovery of inaccurate testimony is found in his answers he may be imprisoned in the United States for perjury. I asked various agents—those of the large trans-Atlantic lines as well as independent agents—what effect this rigid treatment of the unsatisfactory replies of the emigrant, and in the case of the independent agents, it was made quite clear to me that they are compelled to exercise the most diligent care in this respect because in the event of any of their patrons being rejected by the United States Government they have to forfeit the commission on said tickets, and run a great risk of losing the agency for the company returning said emigrant.

What becomes of the rejected emigrant is not so easy to ascertain, but two young men, Welsh striking miners—that is, men who were on strike for higher wages in Wales—were standing near the Princess Landing Stage on the evening of my arrival at Liverpool, and as they looked like men about to go to sea I ventured to engage them in conversation.

I learned, as above stated, that they were striking coal miners, that their names were, respectively, Thos. Williams and James Price, that they had no relatives in America, and had £6 each (borrowed money), and that they had been refused passage to the United States on the ground that they could not be landed at New York. "What are you going to do now?" I said, and they replied, "We are going home. We have been approached by a Dominion Line agent who offers to send us to Canada and to maintain us here until their ship sails. This agent tells us that we can easily work our way across the Canadian line to the American mines, if we are desirous of going there, but we don't like the prospect of a penniless tramp across Canada, hence our determination to return home."

This instance is by no means a singular occurrence at Liverpool and the principal ports at which the board of trade regulations are so energetically enforced. Here, then, is the first cause of the diversion of emigrants from our ports to Canadian ports.

Friday night is always a more or less busy night among the steerage depots at Liverpool, and it may be in order for me to state here that steerage passengers at this port always stop at lodging houses that are licensed to afford accommodations to them. At a certain hour on the day prior to sailing a board of trade physician calls at these boarding houses and carefully inspects the physical condition of all the emigrants therein, and if any are found physically unfit, they are promptly rejected. Mr. Boyle, the United States consul at Liverpool, says, "Rejections by the board of trade physician are by no means uncommon," but at the moment he was unable to give me any exact figures on the question but promised to do so in the near future. The agents shipping to Canadian ports are not permitted to sell tickets to any of the emigrants who have been rejected by the board of trade physician, as their rejection is based solely upon sanitary grounds, and is insisted upon because the health of the ships would be endangered by their presence therein. But all those who are objected to on other than hygienic grounds at once become objects of extreme solicitude to the Canadian ticket agencies.

The United States consul has no power to inspect or pass upon emigrants to Canadian ports even though they are destined to the United States via Canada. In addition to the boarding house inspection the board of trade physician again inspects all steerage passengers as they board the ship on the day of sailing. I was cordially invited by the United States consul, Mr. Boyle, to witness one or more of these inspections, but I declined his courtesy on the ground that I had not the time to spare. However, I subsequently found that I had sufficient time, but did not accompany the consul, preferring to observe the inspection without the doctor's knowledge of my presence. The inspection to a layman looked like a very rapid affair, the passengers passing the physician at a rate, approximately, of 2,000 an hour.

Only in a few instances were heads uncovered, so that it can not be said to have been a very searching inquiry, although it must be remembered that he had seen most of them at the lodging houses the night previous. This physician, it must be borne in mind, is under no obligation to point out that this or that emigrant is likely to be objectionable to the United States immigration authorities (though it is stated that he has, on many occasions, done so). His sole duty under British laws and regulations is to protect the health of emigrants while on board ship. Mr. Boyle or his assistant are invariably present at the inspection conducted on board ship, though they do not accompany the doctor to the boarding houses.

Mr. Boyle stated that he has such great confidence in the ability, integrity, and faithfulness of the board of trade officials that he practically relies on their inspections and is governed by them. He further states that no examination other than a medical one is ever made, the consul having no authority in matters of emigration other than that of a sanitary nature, including the disinfection of baggage.

It may be opportune to remark, parenthetically, as it were, that whatever may be the result of these sanitary precautions, it can not be denied that the rigid interrogations and lucid explanations at all the large shipping centers serve to nullify the work of the United States contract-labor inspectors, for the emigrant is not only advised that he can not be landed at a United States port, if under contract, but he is made to sign a statement, as has already been pointed out, to the effect that he has no employment, and is then given a printed statement setting forth that he may be called upon to swear to the truth of these statements by the United States immigration commissioners, and if it is found that he has sworn falsely he may be imprisoned for perjury.

After a mechanic or laborer has been subjected to an ordeal of this kind at Liverpool it ought not to be a difficult thing to realize that a week later he will be in prime condition to pass successfully the searching inquiries of the United States contract-labor inspectors. There is such a similarity of action on the part of all the agents and the respective companies doing business at Liverpool that the above account may be said to adequately describe them all. It may be said with equal force that while all who are en route to the United States under contract (either specific or implied) are put through such a course of questioning at Liverpool that they alter their statements on this score and depart for the United States with an intelligent appreciation of the situation they have to face, those who are deemed likely to become a public charge, and are rejected by the agents on that account only, find no difficulty whatever in emigrating to a Canadian port, there being no barrier against them, unless the board of trade physician has objected to them on hygienic grounds. It is a curious fact that England has no quarantine regulations at present against immigrants, but a most rigid one against emigrants. A person may find easy access to England (no matter how badly afflicted), but he can not leave England without passing a satisfactory quarantine examination.

The law expressly requires that the master of any ship departing from an English port to any

country (other than those touching the Mediterranean Sea) shall submit a complete manifest of the ship's complement (cabin and steerage), duly and properly authenticated, to the Government emigration or customs officers before sailing, whereas he need not submit the manifests when arriving from any port outside the Mediterranean Sea until 24 hours after his arrival. This manifest must set forth the names and numbers of all the steerage passengers, the ports at which they embarked, whether any were born in the steerage, or if there were any deaths. Cabin passengers are not noted on these manifests. All Mediterranean ports are exempt from this regulation.

After leaving Liverpool for London I stopped at a number of provincial towns, embracing agricultural, mining, and manufacturing industries, but owing to an unusually brisk period of trade and an uncommonly good harvest, there was not much emigration spirit among the people, but I deem it worthy of note that at not a single trans-Atlantic ticket agency did I find the slightest hesitancy on the part of the agents to admit that they deem it their duty to advise parties in quest of tickets to the United States how best to effect a lawful (f) landing there. It is the popular belief in provincial England that those who are not beyond doubt outside of the prohibited classes can pass muster, by evasion and reservation, when being examined by the United States immigration inspectors; and when evasion and reservation are not considered quite effective, there is always a way open via Canada. Indeed, one energetic agent boldly declared that anyone who really wanted to go to America could scarcely be kept out, no matter how vigilant the United States immigration authorities may be. * * *

It will be noticed that one of the causes of the diversion from United States ports to Canadian ports is due to the somewhat strict scrutiny on the part of the general agents of the trans-Atlantic lines, and the agility and macerulousness of many of the Canadian agents, who make the rounds of all the emigrants' rendezvous in search of the "cut offs," that they may book them to Canada, advising them that the United States is easily entered via Canada. *

A casual observer in London would be apt to conclude that the question of immigration was not one that gave the average Briton any undue concern; but how different to the interested investigator! Indeed, it soon impresses itself on such a person that there is no question so vital to the interests of those residing in large cities as immigration, and it is quite within the bounds of moderation to state that the British Government is the best informed in the world as to those who come and go, and also as to the immigration into all other countries, particularly into the United States of America. The board of trade is fully cognizant of the methods in vogue at every immigration station in the United States and Canada, even to the detail of every rejected immigrant, what finally becomes of his case, the decision of the courts in all cases where a prosecution has been undertaken, together with all legislation on the subject enacted and immediately prospective. They have on file the views on immigration of all the American trades unions and many trades unionists, together with the views of leading statesmen and jurists.

It is generally admitted that these investigations carried on by the British Government were intended to serve a humane purpose, and in the main, no doubt, have done so; but whatever the intentions, when one finds these detailed accounts of the examinations of immigrants at New York, Baltimore, Philadelphia, and Boston in the hands of those who are deeply interested in the emigration of those dependent on charitable institutions for support, it is difficult to divest one's self of the opinion that they have served another purpose as well—that of suggesting the easiest point at which to effect an entrance on the part of the less desirable emigrants to the United States.

One agent informed me that he never thought of sending a doubtful case via New York, but preferred Philadelphia or Boston, and as a last resort Quebec or Halifax. I have never been at any of these landing depots other than New York and do not know how he reached this conclusion, except from the reports made by the board of trade experts, who personally inspected all of them and whose reports were laid before Parliament, ordered printed, and put into public circulation. What could be more suggestive to those interested in sending undesirable people to a foreign shore than the following extract from the report of a board of trade expert, Mr. Schloss, pages 41-42, 'Report of the board of trade on alien immigration,' 1894?

"The immigration into Boston from Canadian ports—Yarmouth and Halifax—is quite distinct in character from that which takes place from the trans-Atlantic ports and is treated in a widely different manner. Persons found to be ineligible or to have come in violation of the alien contract labor law are debarr'd from landing; but the examination of passengers coming from the Dominion is of a very slight character. On the occasion when the writer witnessed the landing of passengers brought by a steamer from Yarmouth, Nova Scotia, the doctor and the immigrant inspector stood at the head of the gang plank, the passengers deffling past them. The inspector put questions to the first few who came along. He said he usually put questions to one in ten; the rest he merely glanced at. The entire examination of 24 passengers by the doctor and immigrant inspector occupied 5 minutes.

"Out of 27,641 passengers who arrived at Massachusetts ports from the Dominion of Canada in 1892 only 63 were debarr'd from landing. *

"It is fairly certain that the 5 quarrymen who were sent back to Canada in 1892, as having come in violation of the alien contract labor law, were not the only persons—were, indeed, but a very minute proportion of the persons who came to Boston and minor Massachusetts ports under circumstances making their entry into the United States unlawful. * * *

"What is more, Mr. Colcord, United States immigrant inspector, declared that in his belief every immigrant from Canada whom the inspectors had stopped at Boston had afterwards got into the United States by the land frontier, usually by Vanceboro, Me."

In a footnote the writer says that the United States commissioner of immigration at Boston denied that any European immigrants used Canada as a vantage point for entering the United States, but proceeds to point out that the commissioner was on this point, to some extent at least, in error.

Be that as it may, here stands out the plain incontestable fact that the official expert opinion of the British board of trade is that Canadians find it comparatively easy to enter the United States. It will be noticed that this is part of a report which, taken as a whole, is a compendium of information for the British public on the United States immigration laws and the methods of their enforcement at all the ports of entry on the Atlantic seaboard.

The emigration bureau at 31 Broadway, Westminster, SW., issues a monthly statement to the public advising mechanics, laborers, and domestics where to go and how to get there, also where not to go. This circular is based largely on consular reports, and states the condition of trade in the various industries, and always urges Britons to stay away from undesirable places, leaving the inference to be broadly drawn that those places not included should be selected by persons desirous of emigrating. A special pamphlet setting forth the developments of the tin-plate industry in the United States has been issued very recently, and the emigration bureau urges all persons interested in said industry to secure a copy of it.

It requires no great stretch of the imagination to observe what bearing the various reports have on each other and how they conjointly affect emigration to the United States of America. * * *

The information gathered among the recipients of organized Jewish charity suggested a call on the

principal dispenser of said charity. Subsequently a call on the Jewish Colonization Society and also at the headquarters of the Society for the Relief of Destitute Jews. At the former place those in attendance were as silent as the proverbial sphinx, and absolutely refused to impart any information whatever touching emigration or immigration, the means at their disposal, or the manner of its disbursement. Then I called on Mr. Solomon, of the Jewish Colonization Society, at 17 Old Broad street, London. He at once became the questioner, and shortly informed me that if I would bring a letter of introduction from some reputable Hebrew or Hebrew society he would be prepared to discuss the matter with me, but not until then. He said, however, that I might get the information desired by applying at the society's main office at Paris.

I next called on Mrs. E. A. Finn, secretary of the Jewish Relief Society, at 41 Parliament street, who appeared to be quite willing to assist me in my search for information, but could not do so officially without the consent of the board of directors of the society. She, however, stated that the chief aim of their society was to colonize Palestine with destitute Jews and sustain them until they could sustain themselves, though when the applicants for charity strongly desired to emigrate to other parts, they sometimes assisted such persons to attain their desired ends. Mr. McLeod, to whom I have already referred, informed me that the board of trade collected returns from all institutions who distributed aid to the poor, and, in view of the fact that none of these societies would disclose any information, that it would be best to get it from a governmental source.

I therefore went again to the board of trade (labor bureau), and there found access to the following data which has a direct bearing on the subject under investigation:

"The Russian and Polish immigrants increased in 1897 by 2,002. (Of a total of 12,282 Russian and Polish immigrants 83 per cent went direct to London, and this class of immigrants from Libau is constantly on the increase.)

"How many of these Russians and Poles who were not stated to be en route to other countries subsequently left the United Kingdom within the year we have no means of knowing, but that many did so leave is certain, for a great number of persons belonging to these nationalities were certainly included among the 2,700 aliens who, as mentioned above, were ascertained by the customs officers to be proceeding forthwith to other countries, though not so stated in the alien lists.

"There is reason to suppose, moreover, that the above figure is in reality considerably under the mark. Again a certain number of immigrants doubtless left the country subsequently, either through the aid of the Jewish Board of Guardians, or the conjoint committee of that body, and the Russo-Jewish committee, or without such assistance.

"During 1897 the above agencies assisted about 2,000 Jews (mostly Russians and Poles) to emigrate, and while no doubt only a part of these had arrived in this country during the year, this outflow must be taken into account in estimating the growth of the foreign Jewish population of London.

"It is known also that on a smaller scale various Jewish charitable organizations in the provinces (smaller towns) assisted poor Jews to emigrate during the year.

"It is clear, therefore, that there is an appreciable outflow of Russians and Polish Jews other than those described as transients in the alien lists to be set against the immigration, although the data do not exist to enable its magnitude to be estimated. A special report received from Riga again draws attention to the considerable amount of passenger traffic now carried on between the port of Libau and the ports of London and Hull, and mentions that there was an increase of about 2,500 in the number of immigrants by this route to the United Kingdom in 1897, as compared with the preceding year. The following report adds: The greater number of these were supposed to be en route for South Africa and America."

The number of new cases of destitute aliens who were assisted during the year by the conjoint Jewish and societies were 1,827.

The number of inmates of the Poor Jews Temporary Shelter (a place which I carefully investigated), Whitechapel, all of them persons who had come from abroad, was 2,811. The majority of these people left the country again within a year, mostly for South Africa and America. The London police report that quite 25 per cent of all those arriving as alien immigrants may be classed as paupers—destitute aliens—and the number of Jews in East London still increases and the area inhabited by them is extending.

The returns show a falling off of 7,000 emigrants to South Africa, and of 22,000 to the United States, but no decline whatever in the emigration to Canada, and in view of the fact that more than 2,000 Russian and Polish Jews were emigrated in 1897 by these charity organizations, it is not to be wondered at that there is no falling off in Canadian immigration.

While the data used in the foregoing report were drawn chiefly from London sources, it must not be overlooked that there are great numbers of destitute aliens, chiefly Russian and Polish Jews, in all the large towns of the United Kingdom, who are in receipt of relief from the various relief societies, including assistance to emigrate.

Satisfying myself after a most patient investigation that many destitute aliens are sent from England to America, I went to Havre to continue my investigations there. Mr. Thackard, United States consul at that place, stated that little or no immigration to France via Havre went thence to London, but that he gathered from the British consul general that a stream of very undesirable immigration was passing out at Dieppe bound for New Haven, England, many of whom were believed to be en route to Canada; 4,402 aliens left Dieppe for New Haven, England, in 1897, thence to other parts. He says that his inspection of immigrants is confined strictly to a quarantine character, but that it is most searching, and all aliens destined to America via Havre are subjected to a most thorough overhauling and the baggage is all disinfected, the Général Trans-Atlantique Company having erected, at his request, a most complete fumigating apparatus for this purpose.

He regrets that he is not in close touch with the immigration department at Washington, believing that he could occasionally be of service, if he were certain that his views or suggestions would not be regarded as an intrusion by the commissioners of immigration.

He suggested, as a result of a conversation with the British consul, that if destitute aliens arriving in the United States or Canada, giving as their last residence England, that if a passport were demanded by the United States Government it would be an easy matter to distinguish whether they were really British or Canadian, or had merely passed through England or Canada, as a passport can not be acquired by anyone not having resided five years under the British flag. He deems the worst class of people arriving at and departing from Havre to be southern Italians and Orientals, but does not feel that he has any power to object to their shipping to America, except on quarantine grounds, even when he does not think them very desirable.

On my way to Bremen I stopped off at Cologne and canvassed the various ticket agencies as to the methods in vogue there in dealing with emigrants, and I learned that under the new German emigration law that they were proceeding with their business on somewhat contracted lines.

Under this new law it is illegal to induce any German or Germans to emigrate from Germany, and all advertising must be confined to the announcement of the proposed sailings, etc. As a result of this all the prospectuses which he formerly distributed setting forth the advantages offered to emigrants

in foreign lands have been withdrawn from circulation. I saw huge piles of these circulars and pamphlets on his shelves, but he was not permitted to give them out to German subjects. His principal business is that of booking cabin passengers.

This new law and regulation came into operation on April 1, 1898.

I arrived at Bremen on the day following my inquiries at Cologne, and there found an American vice-consul who not only knows a good deal about emigration and immigration, but who is most willing and anxious to assist the United States Immigration Bureau to the very best of his ability.

Bremen is to Germany what Liverpool is to England, as far as emigration is concerned, and it is here that one comes into close touch with not only the emigration question, but with large numbers of emigrants.

From January 1 to July 1, 1898, 24,209 steerage passengers were emigrated from Bremen and Bremerhaven for the United States. Of this number the United States consul temporarily rejected 623, who were detained for medical treatment; some of whom were subsequently taken to the United States at the risk of the North German Lloyd Company, the manifest sheets bearing the names of these rejected ones being thus marked: "Taken at the risk of the North German Lloyd Company."

The consul also permanently rejected 161 undesirable emigrants.

Now, it is a very interesting thing to note what becomes of these rejected ones. The German emigration commissioner has very great powers in matters touching emigration, and derives them from the new emigration law which went into effect April 1, 1898. It may safely be left to him to see to it that the undesirable stream of emigration through Germany to other countries does not find a lodgment in Germany, and they are compelled to "move on" or return to the country whence they came.

This officer sees to it that no unhealthy person or persons are given passage on any ship leaving Germany—that is, any steerage passenger, as the new law gives him no authority to deal with saloon passengers—and as a result of this distinction an agent at Bremen (who has no connection with the North German Lloyd Company) immediately takes up all the rejected emigrants and ships them to West Hartlepool, or some other English port, as cabin passengers, whence they are sent to America by the process alluded to in the earlier part of this report.

It is a matter of record that the German Government has long taken the precaution to disinfect the baggage of immigrants, and, in some instances, the immigrants themselves, who cross the line into Germany.

Under the "new law" more stringent measures than ever have been taken by the German Government, and a few more stations have been added, viz, Instenburgh, Jilist, and Kuhlleben. By way of water these people are not permitted to enter Germany.

A few days prior to my visit to Bremen a steamer smuggled a load of Russian Jews into Stettin. The police at first threatened to return them to Russia, but after much telegraphing, etc., they were permitted to proceed to Bremen, where they were disinfected, and in most cases fell into the hands of Mr. Harry Cohen, the independent agent above referred to, and shipped by him to England and the United States.

The German emigration commissioner made an effort to stop Mr. Harry Cohen from continuing his business as an agent, but he was allowed to continue, because his exclusion would have involved foreign complications, he being the regularly appointed agent of the American Line and Red Star Line. I had a long talk with Mr. Cohen, and learned from him that he gets the bulk of his business direct from his own local agents, who are to be found all through Russia and Galicia. I saw him issue tickets to 27 emigrants who were, for the most part, of the very worst undesirable class; all were sent to Hull, England, thence to Philadelphia, via Liverpool.

To say the least of it, it is a very deplorable thing to see these poor people sent away from Bremen because of a general unfitness to ship thence, and after weeks of additional waiting, and hundreds of miles of additional travelling, to find that they reach their objective point through this devious channel, and it is the general expression of the United States consuls that they regret their inability to successfully cope with this very important question.

The experience of the United States consul at Hamburg (Dr. Hugh Pittcairn) is exactly like unto that of the consul at Bremen, excepting that he has not found it necessary to reject so many emigrants. However, those that have been rejected by him are immediately shipped direct to England, to some one of the 26 English ports, and then reshipped to America.

It appears to me that a quotation from a typewritten statement now before me, being a sort of compendium of the United States consular opinion on emigration from some of the continental European ports, may be used here:

"The disinfection of the undesirable streams of immigration from Armenia and parts of Italy, Galicia, Russia, and Russian Poland is attended to with the greatest diligence by the various countries through whose respective territories they must needs pass before they reach the port at which they intend to take ship to the United States of America; and at the ship's side they are inspected again, all of which signifies, as plainly as anything possibly can, that a large percentage of them is unfit to be absorbed by any self-respecting community.

"The rejection of an undesirable immigrant by a German or a French official is a sufficient thing in itself to guarantee that such an immigrant will not be allowed to remain in either country, but when objected to by a United States official it means that the immigrant will simply be transferred to some other port by the agent already on hand to pick up all the odds and ends of the regular liners and turn their weary and unfortunate feet into the roundabout way which has been made for this refuse class by the ingenuity of the independent and less responsible agents referred to.

"We think it would be a very good thing to visit all the state line control stations and observe the handling of emigrants there. Here, too, are the recruiting stations of the ship companies and emigrant agents, all of whom have local agents at the control stations. We believe that it would be of immense benefit to our country and money well spent to have one or two men, special agents, stationed in that part of the country nearest to these control stations, whose duty it would be to see that the United States alien contract labor laws are not being infringed upon.

"Such agents should be directed to make frequent trips to the various recruiting stations, gather evidence on the spot, etc. From our point of view such a plan can not fail to work admirably well. Many of the cases arising from the contract-labor laws are dismissed because of an absence of sufficient evidence to convict. Such an officer as herein stated could not only furnish much of the necessary or missing evidence, but actually prevent a great deal of this illicit emigration.

"On the long road of emigration such an officer would be the first hold up, so to speak, or a sort of buffer, the consuls at the seaports the second, and the inspectors at our ports the third.

"Changes in immigration affairs, as in all other vitally important branches of government (dependent upon legislative action), are necessarily made slowly and with much difficulty, but by taking an administrative course these outposts could be established without much difficulty, and an inspection which begins before the too oft deluded emigrant has gotten very far from home can not fail to do a twofold good, i. e., stopping the emigrant from spending his last dollar and of saving our country from his undesirable presence."

That our consuls have a patriotic realization of the grave importance of purifying the stream of humanity which constantly flows out to us from the congested and festering quarters of all the old countries, can not be questioned, but they lack the power to check it or divert it from its objective point, and I have no doubt whatever that the consensus of opinion of the United States consuls in Europe (coming in direct contact with the immigrants) is that we need to commence the work of inspection long before the emigrants arrive at our various ports of entry.

It is stated that our Government is represented in Europe by officers of the Navy Department, of the War Department; also by special agents of the customs revenue department, as well as by experts from the Agricultural Department, but hitherto it appears that no one has ever been officially authorized to keep an eye open to the welfare of the United States in the very important matter of passing on the fitness or unfitness of those who come to us and enter into our national life in all its multifarious connections.

Having learned that there were several daily sailings from Hamburg to English ports, I decided to go by one of these routes, with a view to ascertaining how they landed their immigrants in England. Accordingly, I booked on the steamship *Lutterworth* from Hamburg to Grimsby. I did not find any persons in the cabin who might possibly belong to the steerage class, but it was on a Monday night, and I learned that this class of persons is usually carried on the day on which a Hamburg-American liner has departed for America, and they do not depart on Mondays.

The cabin fare, exclusive of food or service, is only \$7.50 from Hamburg to Grimsby, while the steerage rate is \$5, so that in the event of the German emigration commissioner refusing emigrants steerage shipment out of Germany, it is not at all difficult for them to get out as cabin passengers on the regular liners plying between Germany and England. As I have already pointed out, the German emigration commissioner has no authority to interfere with the emigration of cabin passengers. It is even less of a difficulty to go via Bremen, through the agency of Mr. Cohen at that place. The steerage passengers of the *Lutterworth* went ashore at Grimsby without a single question, except such questions as are asked by the customs officers, and they, of course, pertained only to revenue duties.

On going ashore they went to the several railway stations, destined to various parts of England, chiefly to London and Liverpool.

The new emigration law now in force in Germany compels the shipping companies doing business in Germany to deposit 100,000 marks with the Government as a guaranty that they will return all immigrants rejected by foreign Governments to their native homes (if in Germany) and to the extreme German border line if in any country outside Germany. When rejected immigrants (not German) are returned from America to Germany, the German Government insist on their being forwarded through Germany to their respective homes at once, and if the companies do not act promptly the German emigration commissioner forwards them at Government expense. The Government then appropriates the amount from the deposit made by the company in question, after which the company is prevented from doing any further business until the deposit is made up to the one hundred thousand marks. The operation and enforcement of this law has been most beneficial to the independent agents who send their passengers via England, for they send all kinds and conditions of men without running the slightest risk, because their passengers, if deported from America, are sent to England, where they remain in all their destitution, to be fed and watered by the charity organizations (which abound there), and there they are cultivated, as it were, for a second attempt to enter the desired land. In such cases they are always sent to a different port than that at which they were rejected on their first attempt to obtain a landing.

The social and industrial movements which manifest a remarkable increased interest each succeeding year in all the countries of Europe have one result which is common to all, viz: They emit a certain portion of their population, regardless as to its destination, and it is this very condition which is awakening a sense of danger in all the newer countries of the world and begetting a spirit of vigilance at their thresholds which is intended to keep outside their gates all the undesirable emissions of population from the densely settled sections already alluded to. Indeed, one can not review the trend of recent legislation by any of the European Governments without being deeply impressed with the effect it has on other countries, near and remote.

Nothing, for instance, could have been further from the thoughts of those who originated the plan to compel employers in Great Britain to compensate injured or killed employees than that they would stimulate emigration by its enactment into law, and yet it is morally certain that this will be a characteristic result of this law. * * * This law, together with much recent European legislation, is tending to swell the volume of undesirable emigration from the various countries of Europe. I beg to call your special attention to the following laws which have just gone into effect in South Africa (the colony of Natal) and in western Australia, two comparatively new countries. The Natal Immigration law went into effect in 1897, and "prohibits the landing in Natal of the following persons (among others), first, of anyone who can not himself write out and sign in the characters of any language of Europe a prescribed application form of admission, giving his name, address, and business; second, of anyone who is a pauper or likely to become a public charge; and third, of anyone not having received a free pardon who has within two years been convicted of a felony or infamous crime or misdemeanor involving moral turpitude, and not being a mere political offense."

The British emigration bureau has publicly announced that this act is intended by the Natal government to keep out Asiatics and such Europeans as are not respectable.

Western Australia passed an act in 1897, that went into effect immediately after its enactment, which provides "that the following persons, among others, are prevented from landing: First, anyone who can not himself write out in the characters of any language of Europe a passage in English of fifty words taken by the appointed officer (Immigration Inspector) from a British author, and append his name thereto in his own language; second, anyone who is a pauper or who is likely to become a public charge; third, anyone who within 3 years has been convicted of a felony or infamous crime." This act is known as the restriction act of 1897.

It will doubtless be said of these two colonies that even though they were to close their doors entirely it would not affect emigration very much, but this is a great mistake.

It is not necessary to do more than point out that nearly one-third as many of the poorer class of immigrants were admitted in 1896 to these two colonies as were admitted to all North America.

With the narrowing of the channel of admission to these colonies and the absolute certainty of the exclusion of all who are in the prohibited classes (a number which will reach not less than 85 per cent of the whole), it necessarily follows that one of two things must happen: First, either the stream of emigration from the poorer sections of the world must diminish in proportion to the number formerly admitted to the colonies named, or second, those countries keeping "open door" must get an increased immigration from these sections.

A study of the conditions in all of the unhappily congested areas would clearly indicate that there will be no falling off in the number of emigrants so long as the hand of charity contributes to the

stream. I have based my calculations as to the decrease of immigration to the colonies under the new law on the first returns furnished since the acts went into operation. The British board of trade reports that after the passage of the "Natal" law a decrease was noticed in the number of foreign immigrants. British and Irish emigrants fell off from 24,594 to 21,109, a decrease of only 14 per cent, while foreign—that is, non-English emigrants—fell off from 11,246 to 7,692, a decrease of 31.6 per cent. The returns from western Australia show a marked increase in the desirable element and an estimated falling off of the undesirable element.

If these significant moves on the part of the government herein named touching immigration are not sufficient to awaken a livelier interest in the question among our own people, it may be of further interest to those who fix on an unlimited and unrestricted immigration to carefully ponder the following bill, which has successfully passed the House of Lords in the Imperial Parliament of Great Britain, on June 28, 1898.

"A BILL (AS AMENDED BY THE STANDING COMMITTEE) ENTITLED 'AN ACT TO REGULATE THE IMMIGRATION OF ALIENS, A. D. 1898.'

"Be it enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the lords spiritual and temporal and Commons, in this present Parliament assembled, and by the authority of the same, as follows.

"1. This act may be cited as the aliens act, 1898.

"2. It shall be lawful for Her Majesty, from time to time, by order of council, to designate ports in the United Kingdom to which this act shall apply for such period as respects each port as shall be specified in the order. Ports so designated shall be termed regulated ports.

"3. Inspectors and medical officers appointed by the board of trade may board any vessel arriving with immigrant passengers at any regulated port, and may inspect the passengers, and any inspector may, subject to and in accordance with regulations to be made by the board of trade, prohibit the landing of any alien who in his opinion is either an idiot, insane, a person without means of support, or a person likely to become a public charge, or a person suffering from any contagious or infectious disease of a dangerous character, provided that no alien shall be prohibited from landing by an inspector on the ground that he is an idiot, insane, or a person suffering from any contagious or infectious disease of a dangerous character unless with the concurrence of a medical officer of the board of trade.

"4. Any alien prohibited from landing, as aforesaid, shall be sent back, in accordance with regulations to be made by the board of trade, to the port whence he came, and the expense or estimated expense of his return shall be borne by and recoverable in a summary manner from the owner of the vessel in which he arrived.

"5. The board of trade may, with the consent of the treasury as to number and salaries, appoint and may remove inspectors and medical officers for the purposes of this act, and may assign to them their duties, and, subject as aforesaid, fix their remuneration.

"All expenses incurred by the board of trade in or about the execution of this act shall be paid out of moneys to be provided by Parliament.

"The board of trade may make regulations for the execution of the provisions of this act."

No such bill could possibly command the attention of the House of Lords unless it fairly reflected the views of a very large portion of the population of Great Britain, and I am bound to say that though the provisions of the bill are more drastic than our own immigration laws, they in no way do violence to the British conscience as far as my investigations qualify me to estimate the sentiments of the people. If the flash light of antiquating public mind is ever turned on the noisome, squallid places occupied by the alien immigrants of England, the action of the House of Commons will surely stamp Lord Haldewick's bill with the seal of public approval, and in that event there remains but one place to which this emitted fragment of the human race can go—America—and unless great care is taken to sift the good and worthy from the vile and lathsome, our leniency will be outraged by the organized charities of Europe, which find it more economical to emigrate its burdens than to perpetuate their measures of relief and sustenance.

In conclusion I dare boldly affirm that thousands of immigrants are landed annually in the United States who are wholly or in part sent by the charity of others, but so thoroughly tutored by their benefactors that their state of destitution and dependence is, to a great extent, concealed; that they are habitually sent to the ports which experience has marked out as the least likely to reject them, New York being shunned by every agent in Europe who has a doubtful case to dispose of.

I am, very sincerely, yours,

ROBERT WATCHORN.

"LETTER FROM THE UNITED STATES CONSUL AT LIVERPOOL DESCRIBING CONSULAR AND MEDICAL INSPECTION OF IMMIGRANTS DESTINED TO THE UNITED STATES THROUGH CANADA

CONSULAR SERVICE, UNITED STATES OF AMERICA
Liverpool, June 21, 1901.

HON. W. M. OSBORN,

Consul-General of the United States,
12 St. Helen's Place, London.

SIR: I beg to reply to your letter of the 20th instant, inquiring whether Dr. Anderson (the United States Government medical officer stationed at this port) or I exercise under any law the right to refuse permission to any emigrant to sail to the United States, either first, second, or third class, and if so, how many and what restrictions are in force in this regard."

I would first say that at the present time Dr. Anderson's duties relate exclusively to emigrants embarking on ships touching at Canadian ports, and this I will explain further on.

Answering your inquiry in its strict letter I would say that I do not exercise any right to directly refuse permission to any emigrant, irrespective of class, to sail to the United States. It is, however, my duty to see that the various immigration and quarantine laws of the United States applicable to the port of embarkation are carried out. In this connection I would refer to articles 11 and 13 of the "Immigration laws and regulations" of the Treasury Department (last issue, April 9, 1900) and to the "Quarantine laws and regulations," Treasury Department of the United States (revised edition, November 13, 1899).

Every vessel clearing from this port (and the same requirement holds good as to every foreign port) is required to obtain from the consul a bill of health. Practically speaking, the only way in which the consul can exercise direct authority under United States law "to refuse permission to any emigrant to sail to the United States" is by declining to give the bill of health to the ship. Section 2 of the quarantine act of February 15, 1893, requires the consul before granting the bill of health "to be

satisfied that the matter and things stated therein are true." If I were not satisfied that such "matters and things" were true I would certainly decline to grant the bill of health, and would also, probably, cable the Department of State to that effect. The "quarantine laws and regulations" of November 13, 1899, give the forms of bills of health (pages 12 and 13). A bill of health sets forth the sanitary history and condition of the vessel, and certifies all the requirements of the United States as to the sanitary condition of the vessel, its cargo, passengers, and crew, have been complied with. Before I sign and grant the bill of health I require the master and surgeon to sign and verify the manifest sheets of emigrants, pursuant to article 13 of the immigration regulations (pages 5 and 6). The signings and verifications on the manifest sheets by the master and surgeon of the ship, and by myself as consul, take place on board ship immediately preceding the sailing, but I require the emigrants' manifest sheets to have been previously presented at the consulate for inspection and sealing, and if I find that any third-class emigrant comes from an infected district I require his clothing, baggage, and personal effects to be disinfected, pursuant to article 11 of the immigration laws and regulations. In accepting the declaration and verification of the master and surgeon of the ship, I take cognizance of the known fact of inspection by the British board of trade officers, and of fulfillment of sanitary regulations both local and as laid down by the American Government, on the part of the ship's management. Occasionally the United States Government details one or more medical officers to this port to act in this matter, and then jointly sign the bills of health, in that case the practice being for the consul to accept the decision of the United States medical officer so far as sanitary matters are concerned. My experience is that ships' owners accept the suggestions of the medical officer and the consul, and the occasion to object to passengers after they have been inspected by the British officials arises very seldom. I have never felt called upon to refuse to grant the bill of health, but yet the steamship companies understand that if I was not satisfied with the declarations of the master and surgeon as to the good sanitary condition of the passengers and crew and of the cargo I would withhold the document.

For some time Dr. Anderson and another officer of the United States Marine-Hospital Service were on detail here to make observations and inspection of sanitary matters connected with emigration from this port to the United States, with special reference to the plague then existing at certain places on the Continent, and at Glasgow. After the disappearance of the plague these officers were taken off the detail. Subsequently, however, Dr. Anderson was instructed to inspect the emigrants leaving this port for Canadian ports. As is well known, a large number of emigrants embarking at this port enter the United States via Canada. As I understand it, the alternative presented itself of a rigorous and troublesome inspection, involving quarantine stations at the American frontier by officials of the United States Government, or of inspection at Liverpool, the port of embarkation. The latter system, established on the 5th of February, resulted from an agreement or understanding between the Allan, Dominion, and Beaver Lines and the United States Immigration Bureau. But in so noting Dr. Anderson acts purely in an advisory capacity. As a matter of fact, he is not now officially attached to this consulate, he only makes the consulate his headquarters as a matter of convenience. He does not claim any legal jurisdiction so far as forbidding any person whatever from embarking on the ships in question; nor does he sign the bills of health of these ships. But he inspects, so far as possible, the emigrants—and that irrespective of whether they are booked only to Canada or through to the United States. If he finds any passenger suffering from a disease which would disqualify him from entering the United States, he so informs the representative of the ship's owners. The understanding is that under these circumstances the passenger will not be allowed to sail if the presumption prevails that his intention is to enter the United States. The rule is for Dr. Anderson to make his examination before the examination by the British board of trade medical officer has been made, and before embarkation; and my information is that on one occasion Dr. Anderson advised the rejection of several passengers who had been passed by the British board of trade official, and the explanation is that there are some diseases which disqualify an alien immigrant from entering the United States, but which do not debar him from embarking from a British port on a British ship.

In conclusion I would say that while Dr. Anderson and myself are satisfied generally with the manner in which the requirements of the United States Government are met at this port, yet that we are strongly of the opinion that improvement should be made in the matter of lodging the emigrants who stay here temporarily, awaiting embarkation; and I am just now exchanging communications with the medical health officer of Liverpool in regard to this matter.

I have the honor to be, your obedient servant,

JAMES BOYLE, Consul.

REPORTS TO THE COMMISSIONER-GENERAL OF IMMIGRATION FROM ASSISTANT SURGEON JOHN F. ANDERSON, OF THE UNITED STATES MARINE-HOSPITAL SERVICE, DETAINED TEMPORARILY AT LIVERPOOL FOR THE INSPECTION OF EMIGRANTS GOING TO THE UNITED STATES THROUGH CANADA.

LIVERPOOL, ENGLAND, April 24, 1901.

COMMISSIONER-GENERAL OF IMMIGRATION,
Washington, D. C.

SIR In accordance with instructions in your letter, R. O. D., March 19, 1901, to visit the ports of Queenstown, Londonderry, and Glasgow, to report upon the medical methods of inspection of emigrants from those ports, I have the honor to report the following:

I left here on the evening of the 3d for Queenstown and arrived there the next morning. At present there is only one line carrying passengers to Canada that calls at Queenstown, this line is the Beaver Line. They have one ship each week, leaving here on Sundays and calling at Queenstown the next day. The number of passengers taken on at Queenstown is small, and as far as I was able to learn were exclusively Irish. This statement in regard to nationality, however, must be taken with reserve. While the lack of an inspection at this point leaves a loophole for undesirable emigrants to embark, still I do not think the number justifies the expense of one. Besides I am sure the board of trade will resent it even more than they do here.

On account of ships sailing at short intervals, for some days after my return I was unable to visit Glasgow and Londonderry. I finally left for Glasgow on the 16th and returned on the 17th. There are two lines from Glasgow carrying passengers to Canada, the Allan and the Donaldson, the latter only carrying steerage passengers. The Allan Line have advertised a ship every week for Canada and the Donaldson every fortnight. The number of steerage passengers from Glasgow last year to Canada was under 2,000. I was unable to learn anything in regard to their nationality or in regard to their physical condition. It is quite reasonable to suppose that this number will be largely augmented if there is no inspection at Glasgow and a rigid one. Emigrant agents soon know these things and advertise accordingly. The expense in proportion to the number of passengers would be as large if an officer were stationed there, about \$1.50 for each emigrant imported.

I left for Londonderry the 18th and returned the 21st.

At present there is only one Canadian line calling at this port. The Allan Line steamers from both Liverpool and Glasgow call there for passengers and mails. I was totally unable to learn anything at all reliable in regard to the number of passengers from this port to Canada. The board of trade said they could not tell me, and the steamship agents said they did not have the numbers. The number must be considerable, for the day I was there I saw about 50 embark on an Allan Line steamer. The facilities for third-class passengers to reach Londonderry from Ireland are good, and they can go from Liverpool for about 10 shillings to Londonderry, if for any reason they can not embark here. The board of trade examination there is useless, as on the day I was present the surgeon was not even there. While it will be easy for passengers to leave there without inspection, for the same reasons as noted in regard to Glasgow, I do not think the expense justifies the results to be obtained.

In regard to Liverpool, I have to say that the Beaver line apparently are trying to assist me, but they are such tricky people that I have little faith in their promises. I have repeatedly caught them attempting to deceive me, and even as late as their last ship I caught 2 passengers whom I had rejected twice before. The success of the inspection here depends so entirely on the sincere co-operation of the steamship companies that unless they do assist in every way possible the inspection is almost useless. I have no way of ever being sure that I see all of the passengers. I am strongly of the opinion that the inspection is a failure, in spite of the fact that my rejections for favus and trachoma have been about 2 1/2 per cent of the total number of passengers examined. I strongly recommend that the work here be discontinued and a rigid inspection be established either on the frontier as at Quebec, for in order to be effective on this side it would be necessary to have an officer at Glasgow, Londonderry, here, and perhaps Newtown. The expense of this would be considerable, and even if this was done you would have to reckon on the lack of support of the steamship companies. The companies will make many promises, but they make no secret of the fact that they do not want the inspection here, but are kept to it by the Canadian Pacific Railroad, and finally the board of trade resent the inspection of Canadian passengers. They say that it is very presumptuous to want to inspect passengers from one part of the British Empire to another. If the inspection is continued I am afraid that when an inspection of American-bound ships is wanted for quarantine purposes some hampering rules may be enforced.

Respectfully,

JOHN F. ANDERSON,
Assistant Surgeon, M. H. S.

COMMISSIONER GENERAL OF IMMIGRATION,
Washington, D. C.

LIVERPOOL, ENGLAND, May 2, 1901.

SIR: In reference to the latter portion of my letter of April 24 in regard to the state of affairs in Liverpool, I further have to inform you of some recent occurrences here: I have been struck recently by the number of passengers of the Beaver line steamers who were booked to points in Canada as contrasted with the number so booked in the beginning of my work here; the Beaver people allow all persons booked to Canadian points, other than Quebec, to embark. I have questioned many of these people, and almost without exception they say that they are going to the States later, that "friends" (probably Shonker & Co.) will meet them and buy tickets for them to the States. On Tuesday I inspected the passengers by the Beaver steamer *Lake Superior*, about 600 in number, and I rejected 19—14 for favus and 5 for trachoma; of these 19, 5 only were refused passage by the steamship company. I protested against this, but to no avail. I called the attention of the agent to the fact that two of the persons allowed to embark who were now booked—one to Sydney, C. B., and the other to Montreal—had been previously rejected by me about one month ago, and now by simply changing their destination were allowed to embark.

On account of the number of persons rejected by me who have been returned to Italy, the Italian Government has withdrawn the licenses of the Beaver Line agents to book passengers from Italy. This being the case, they are making every effort to avoid returning persons to Italy, and by booking their passengers to Canadian points only they allow them to embark even after being rejected by me. I will also inform you that the same line has a ship on the way to the Black Sea to embark passengers from Batoum for Canada. This vessel, I am reliably informed, will stop at Naples or Genoa and fill up her passenger accommodations if not full when she leaves Batoum. The same person informed me that they would very probably have a ship to sail direct from Naples or Genoa about July 1 for Canada with about 2,000 Italians; if so, I will be safe in saying that 4 per cent will be suffering from favus and trachoma, and 75 per cent will be for the United States. The only point at which these persons can be apprehended to prevent their entrance into the United States is on the frontier, and until a frontier inspection is established we will continue to get the riffraff and scum of the European population into the States by way of Canada.

As for the work in Liverpool, in my opinion its usefulness is at an end, in view of the recent moves of the Beaver Line. If persons that I reject can by simply booking to Canadian points be allowed to embark, the quicker it is discontinued the better.

Respectfully,

JOHN F. ANDERSON,
Assistant Surgeon, M. H. S.

UNITED STATES COMMISSIONER-GENERAL OF IMMIGRATION,
Washington, D. C.

LIVERPOOL, ENGLAND, June 15, 1901.

SIR: I have the honor to inclose the within letter, which will explain itself. The man, Moses Levi, was rejected by me, with 10 others, on May 7, 1901, and as they have evidently reached the States they lost very little time. The Beaver Line people are quite sure over the continuance of the inspection, as they had hoped it would have been stopped before now. They also blame the decrease in the number of passengers on the number of rejections, which on their line has been about 3 per cent for favus and trachoma alone by me. Ships that formerly carried 800 to 1,000 now rarely have over 400 to 500. They have heard that a frontier inspection will soon be in force, and have notified me that as soon as it is they will refuse to allow my inspection any longer. This being the case, I think it would be decidedly better for us to stop before they make us, so I respectfully suggest that as soon as you mature your plans you notify me by cable when to cease inspections. I request that I be informed, if no objection exists, of the plan of the proposed frontier inspection, for my own information. I will say that shipping men with whom I have talked all agree that a frontier inspection is the only solution of the question, certainly as far as the Beaver people are concerned. I request that the inclosed letter be returned to me.

Respectfully,

JOHN F. ANDERSON,
Assistant Surgeon, M. H. S.

LIVERPOOL, ENGLAND, *July 15, 1901.*SUPERVISING SURGEON-GENERAL U. S. MARINE-HOSPITAL SERVICE,
Washington, D. C.

SIR: I have the honor to make the usual report for the week ending July 13, 1901.

During the week I inspected 650 passengers for Canadian ports. I advised the rejection of 8 persons, 7 of whom were allowed to proceed by the steamship companies, as most of the people I reject are allowed passage by the companies. I do not see that my work here now is worth the cost. All of the persons rejected who were allowed passage were booked to points convenient to the frontier.

Respectfully,

JOHN F. ANDERSON,
*Assistant Surgeon, M. H. S.*UNITED STATES CONSULATE,
*Liverpool, England, August 14, 1901.*SUPERVISING SURGEON-GENERAL
U. S. MARINE-HOSPITAL SERVICE, *Washington D. C.*

SIR: * * * I received orders from the Bureau on January 15, 1901, detaching me from the United States consulates in London and Liverpool and assigning me to the Immigration Bureau for duty in Liverpool. On the same date I received instructions from the Commissioner General of Immigration to call on the different Canadian passenger lines and arrange for the inspection of passengers by their lines. At that time there were three lines carrying passengers direct to Canada, viz, the Dominion, Allan, and Beaver. I called on the managers of the different lines and explained my instructions and wishes and requested to know when I should begin work. The Allan line said at once, the Dominion and Beaver people said they would write me next day. After waiting one week I wrote them asking to know their decision; they then wrote saying that I could begin at once. I will here say that the Dominion line soon after discontinued their Canadian service, and so I will not consider them further. The Allan line readily promised me every assistance, a promise that they have kept to the best of their ability. The Beaver people made the same promise, and, in fact, have made it many times, but have often forgotten to keep it. The Beaver people said that they would try it for a while, but did not think they wanted it, as they could not see the necessity, since their passengers were inspected on the Continent when booked, again in Liverpool at the boarding house, then by the ship surgeon, and finally by the board of trade.

The board of trade in an official letter refused to allow me to inspect Canadian passengers at the time of their examination, and added that they thought it rather impertinent for a United States official to inspect passengers by a British ship from one part of the British Empire to another. This difficulty was avoided by inspecting the passengers before embarkation. But, by inspecting the passengers before the board of trade examination a large loophole was left for putting persons aboard whom I had not inspected, a thing that has happened on the Beaver boats often and I believe still occurs. The Beaver people have absolutely refused to be bound by any count I may make, as they claim the right to allow passengers to embark up to the last minute. Several attempts were made by them to put passengers aboard whom I had rejected. I caught them three times, but am sure it occurred many times without my knowledge. The different companies agreed to accept my decision in regard to the rejection of persons who were presumably intended for the United States if suffering from trachoma and farus, but from no other diseases; hence my rejections have been practically for these two diseases alone. On several occasions I have rejected persons who told me that they had previously been rejected in New York or Naples. The Canadian Pacific Railroad manager in Liverpool called to see me soon after I began work and volunteered any assistance possible. I asked him how he was interested in the matter, and he replied to prevent, if possible, their trains being detained on the frontier for inspection of immigrants. I thanked him and told him the Beaver people did not seem to want to act fair. He called on the Beaver people and told them that if they did not render me every assistance possible in the inspection he would refuse to move their passengers on arrival in Canada, a threat that has helped matters some. I will say here that Beaver people are quite down on me and the inspection, and blame the great decrease in steerage Italian passengers directly to the return of rejected persons to Italy. Ships that carried 800 to 1,000 passengers at the corresponding period of last year now have only from 350 to 500; this in spite of the fact that the other lines are carrying more than last year at the same time. A significant fact in relation to the above is that when I began the inspection, in February, 80 per cent of the steerage passengers were booked direct to United States points; now, only about 40 per cent. Persons booked to the United States are refused passage if rejected; persons booked to Canadian points are allowed passage even if rejected. The Beaver line is not in the passenger conference and carries steerage passengers for about £4 from Liverpool to Canada, which is about 30s. less than the regular rate, consequently the class of passengers is very poor. The Allan line passengers are the usual good class of Liverpool emigrants.

I made my first inspection of Canadian passengers on February 5. Below will be found the numbers, rejection, etc. I have given the two lines separate in order to emphasize the difference in the class of passengers:

Allan line:	
Number of ships inspected	19
Number of passengers inspected	4,553
Total number advised rejection	10
Cause of rejection—	
Trachoma	3
Farus	6
Other causes	1
Percentage of passengers rejected	0.2
Percentage of rejected persons allowed by company to embark	40
Beaver line:	
Number of ships inspected	21
Number of passengers inspected	9,950
Total number advised rejection	230
Cause of rejection—	
Trachoma	79
Farus	142
Other causes	9
Percentage of passengers rejected	2.31
Percentage of rejected persons allowed by company to embark	30

Summary:

Total number of passengers examined.....	14,503
Total number rejected.....	240
Percentage of persons examined rejected.....	1.66

In regard to the inspection at foreign ports for the Immigration Bureau, I will say that if all the lines could be made to agree to the inspection and would act fairly, agreeing to refuse passage to all persons rejected, it would be a most excellent thing. The value of the present inspection in Liverpool of Canadian passengers is, in my opinion, small on account of the lack of cooperation of all the lines concerned, and I believe the best interests would be served by a discontinuance of the work.

Respectfully,

JOHN F. ANDERSON,
Assistant Surgeon, M. H. S.

REPORT OF DR. VICTOR G. HEISER, DETAILED AT QUEBEC TO EXAMINE EUROPEAN IMMIGRANTS
DESTINED FOR THE UNITED STATES

OFFICE OF COMMISSIONER OF IMMIGRATION,
Port of Quebec, Canada, August 7, 1901.

DEAR MR. POWDERLY: Through the kindness of Mr. Thomas, I have seen the letter of Dr. Anderson of July 15, ultimo, in which he states that his work in Liverpool scarcely justifies the cost. For your information I would state that we are of the opinion here that the medical inspection at Liverpool does us more harm than good, because it gives the steamship companies the advantage of an expert opinion as to whether a given immigrant can pass the United States inspection. When they are informed that an immigrant will probably not pass they book him to a Canadian point. Of this fact we have ample evidence. We have not yet had an instance of one of these cases presenting themselves at the United States inspection after being rejected by Dr. Anderson, but on several occasions I have gone among the Canadian immigrants and detected cases of trachoma which, upon further investigation, were found to have been rejected (advised) by Dr. Anderson. Upon cross-questioning these cases it was soon learned that the immigrant had no intention of remaining in Canada, but would go to their destination in the United States at the earliest possible opportunity, and that they had only booked to Canada because they had been advised to do so. In view of the foregoing facts it seems reasonable to assume that if there was no inspection at Liverpool, many of the cases would not be forwarded, and consequently would present themselves at the inspection here, and thus give this office a better opportunity to prevent them from going over the border.

About a week ago I transmitted to the Marine Hospital Service a report of the transactions of the service here from the commencement of the inspection, on May 20, to the ending of the fiscal year. I thought it well to mention this, because you might want some of the figures in preparing the annual report.

Yours, sincerely,

VICTOR G. HEISER.

OFFICE OF COMMISSIONER OF IMMIGRATION,
Port of Quebec, Canada, June 30, 1901.
SUPERVISING SURGEON-GENERAL, MARINE HOSPITAL SERVICE,
Washington, D. C.

SIR: I have the honor to transmit herewith the report of the transactions of the medical division of the immigration service at this port from the commencement of the medical inspection, on May 20, ultimo, to the ending of the fiscal year, June 30, 1901.

During this period there were inspected 3,626 immigrants, passed, 3,575; detained, 51. The cause of the detention and the final disposition of the cases is shown in the medical and surgical report herewith inclosed.

The conditions under which the inspection must be made are very unsatisfactory and a thorough inspection under the present arrangement is impossible. A new building is under construction and will probably be ready for occupancy about August 1. The Canadian officials kindly consented to make the interior arrangement of the building conform to the ideas of the service here. When the building is completed the facilities for making the inspection will compare favorably with any of those contained at the first-class immigrant stations in the United States.

Much difficulty has been experienced with the hospital cases—in the first place, to induce hospitals to accept them, and, in the second place, to detain them after they have been accepted. Lately we have not had so much trouble in this direction, and it is believed that as the matter is better understood, the difficulty will disappear.

Respectfully,

VICTOR G. HEISER,
Assistant Surgeon, M. H. S.

CHAPTER XII.

LEGISLATION OF FOREIGN COUNTRIES AFFECTING EMIGRATION AND IMMIGRATION.

GERMANY.

In general, European countries, from which the largest number of immigrants come to the United States, have during the past 50 years permitted free and voluntary emigration. Notwithstanding the evident losses to those countries in the fact that emigration takes the more active and productive members and leaves the aged and weaker, yet only in one particular have these governments placed restrictions on emigration, namely, those who attempt to escape their military duties. The German legislation of 1897, however, marks an innovation, if not a reversal of this policy. In the law of June 9, 1897, taking effect April 1, 1898, emigration is looked upon as a matter of national importance and as a means for extending the power of Germany and the influence of German institutions into other lands. Three purposes are sought to be served by this law:¹

First. Protection for the emigrant in the purchase of his ticket and his transportation to foreign lands.

Second. Additional protection on the part of the fatherland for the emigrant in the country of his settlement.

Third. The maintenance of the German spirit and German institutions among the emigrants, particularly by diverting emigration away from certain countries not suitable, and directing it toward other countries where the circumstances are more favorable.

The latter object takes practical shape in the effort to divert emigration from North America to South America. It is argued that in North America conditions are not suitable for the customs, the spirit, language, and institutions of the fatherland, since the emigrants are rapidly assimilated, and are even transformed into competitors of the agriculture and industry of their native land. On the other hand, in South America, especially in south Brazil and Argentina, the climatic, agricultural, and other conditions are favorable, and there the emigrants even find occupation in branches of German industry, and they continue commercial and political relations with the home country. The practical device of the law whereby this diversion of emigration to South America and to German colonies is effected is through the licensing of companies and persons, who are permitted to solicit emigrants and transport them across the water. This license is granted by the chancellor of the Empire on the ratification of the Bundesrath, and while the law does not designate the countries for which the license is applicable, yet the intention is that the chancellor shall grant licenses only to those companies who conduct emigration to South America and the German colonies. In order that the company which conducts the emigration shall be amenable to the German laws it must have at least one member who is a German subject, and must make deposit of 50,000 marks as a security out of which penalties shall be paid. (Section 5.) The license designates the ports and countries to which the operations of the licensee may be conducted, and countries not mentioned are excluded from the field of operation. All agents of the company or society are required to have a license and to limit their solicitations to the territory designated therein. Licenses can be revoked at any time on proper ground, or in view of violation of their condition. (Section 13.)

Persons prohibited from migration are those between the ages of 17 and 25, who have not completed their military service; persons who are subject to judicial or police proceedings, and all subjects of the Empire for whom a foreign government or a foreign colonization society, or similar enterprise, has paid in whole or in part the cost of passage. To this latter class exceptions may be made by the chancellor in favor of those countries to which it is desired that emigration be diverted. The prohibition against prepaid transportation does not apply to those who have received passage money from Germans residing in a foreign country. (Stoerk, p. 100.) This

¹ Stoerk, Das Reichsgesetz über das Auswanderungswesen vom 9. Juni 1897, Berlin, 1899, p. 28.

permits such emigration to the United States, although licenses are not granted to this country.

There are many provisions in the law protecting the emigrant in the fulfillment of the contract entered into with the transporting agency and providing for safeguards in the transit, for accommodations, and for food supplies.

EMIGRATION LAW OF JUNE 9, 1897.

[Translation.]

I.—Contractors.

SECTION 1. Permission is required to forward emigrants.

SEC. 2. Giving or refusing this permission belongs to the chancellor of the Empire, with the consent of the Bundesrath.

SEC. 3. In general, permission is only to be given to—

- (a) Citizens of, and in business in, the German Empire;
- (b) Mercantile associations, joint stock companies, etc., whose headquarters are in the Empire; and business firms, branch business firms, and stock companies whose responsible stockholders are citizens of the Empire.

SEC. 4. To foreigners and citizens of the Empire who are established in business outside of the German Empire, permission can only be given—

- (a) If they empower a German citizen residing in the Empire to represent them judicially in the matter of forwarding emigrants and in dealing with the authorities;
- (b) If they subject themselves to German law and courts in case of controversies arising from the acceptance and forwarding of emigrants.

SEC. 5. Before permission is given the applicant has to deposit securities for at least 50,000 marks (\$11,900), and if intending to undertake a transoceanic forwarding business he must prove that he is a shipowner.

SEC. 6. Permission is to be given only for particular countries, and portions of such, or particular places, and in case of transoceanic forwarding only for particular ports of entry.

SEC. 7. In case permission is requested by German societies whose object it is to procure settlers for lands acquired by them in transoceanic countries, the chancellor of the Empire is not bound by the conditions of section 5; for particular reasons, however, exceptions can be made.

SEC. 8. Permission entitles the grantee to do business throughout the German Empire, with the following restrictions: Outside of the communality of his place of business and that of his branch offices he has—as far as concerns more than giving information to inquiries and the publication of conditions and forwarding opportunities—to avail himself of the assistance of agents, as provided in section 11.

SEC. 9. The grantee can have substitutes to transact his business. The appointment of such is necessary for the establishment of branch offices. After the death of a grantee, and in case of guardianship, the carrying on of the business can only be continued by the substitute for six months. The appointment of a substitute has to be approved by the chancellor of the Empire.

SEC. 10. The permission given to grantees can, with the consent of the Bundesrath, be revoked at any time by the chancellor. The permission of the appointment of a substitute can be revoked by the chancellor at any time.

II.—Agencies.

SEC. 11. Whoever desires to assist in the manner described in section 1 by preparing and contracting the forwarding of emigrants requires permission therefor.

SEC. 12. This permission is given by high administrative authority.

SEC. 13. Permission can only be granted to citizens of the Empire who reside or do business within the district of this high administrative authority (section 12). This permission can not be granted even under compliance with the above requirements—

- (a) If facts are known which prove the unreliability of the applicant;
- (b) If permission has already been granted (section 15) to a number of persons considered sufficient for the proportion of the district by the authorities thereof.

SEC. 14. Before permission is granted, the applicant has to give security for at least 1,500 marks (\$357).

SEC. 15. Permission to do business in the district of the authority granting the same, if the same is not limited to a part thereof only, can be given; with the consent of this authority, the extension of the business into neighboring districts can be granted to the agent by the authorities of such districts.

SEC. 16. Agents can not transact business of the kind mentioned in section 11 for persons other than those mentioned in the instrument of permission, or for their own account.

SEC. 17. Agents can not carry on business in branch offices by substitutes or in traveling about.

SEC. 18. Permission granted to agents can at any time be limited or revoked. Permission must be revoked—

(a) If the requirements of section 13 are not complied with;

(b) When facts exist which prove the unreliability of the agents in regard to business transactions;

(c) If securities, in part or wholly, have been applied to cover claims and are not replaced within four weeks after being called for.

SEC. 19. Complaint against the ordinances of the authorities based on sections 11, 15, and 18, can be entered at the supervising authority within two weeks.

III.—Ordinances for grantees and their agents.

SEC. 20. The securities deposited by grantees and their agents serve for all liabilities, fines, and costs arising from their business transactions with emigrants and with the authorities.

SEC. 21. The Bundesrath issues the necessary regulations about the management of the business of principals and agents, particularly—

(a) About the books and registers to be kept, statistics and other records, as well as the blank forms to be used;

(b) About the manner of giving security and the conditions which are to be entered in the bond concerning the liability and supplementing and restoring the securities.

IV.—Forwarding emigrants.

SEC. 22. The grantee is permitted to forward emigrants only on the basis of a previously executed written contract. The emigrants can not be placed under obligation to pay or refund the whole or part of the passage money, or to refund or work out any advances made to them, after their arrival at the place of destination; neither can they be restricted in the selection of their occupations or places of residence in the foreign land.

SEC. 23. The forwarding and making contracts to forward—

(a) Of persons owing military duty of the age beginning with 17 and ending with 25 years, before they have procured a certificate of discharge (section 14 of the law, about acquiring and losing German citizenship, of June 1, 1870) or a certificate of the commission for substitutes, showing that their military duty does not interfere with their emigration;

(b) Of persons whose arrest has been ordered by any court or police authority;

(c) Of German citizens for whom the passage money has been paid wholly or in part, or who have received advances from foreign governments or colonial societies or similar agents, are prohibited. (Exceptions to this can be granted by the chancellor of the Empire.)

SEC. 24. Emigrants who do not possess the necessary certificates mentioned in section 23, or who belong to the class of persons mentioned in b and c of the same section, may be prosecuted by the police authorities. The police authorities in the seaports are authorized to prosecute those who ship persons whose forwarding is prohibited by this law.

V.—Regulations for emigration to trans-European countries.

SEC. 25. Contracts for forwarding emigrants must include transportation and board to the foreign port of landing. The same is to be extended to the transportation and boarding from the port of landing until the place of destination, as required by the granting of permission (section 1). If the emigrants take passage in a foreign shipping port (not German), or if a change of ships has to take place, these must be mentioned in the contract.

SEC. 26. The sale of passage tickets to emigrants from a transoceanic place is forbidden. This prohibition does not apply, however, to contracts under which the grantee agrees to forward the emigrants from transoceanic ports.

SEC. 27. The contractor is obliged to board and lodge the emigrants at the appointed place of forwarding or shipping, without cost, if the delay of departure is not caused by the emigrants.

SEC. 28. If the delay lasts longer than a week the emigrant has, without prejudicing his claim for damages, the right to withdraw from the contract and to demand the restitution of his passage money.

SEC. 29. The restitution of the passage money can be demanded also if the emigrant or any member of his family accompanying him should die before the beginning of the sea voyage, or if he can prove that by sickness or other circumstances beyond his control he is prevented from undertaking the sea voyage. The same

refers to cases concerning the restitution of the corresponding part of the passage money where, according to section 26, the forwarding from a transoceanic port of landing is prevented. One-half of the passage money can be demanded if the emigrant withdraws from the contract for other reasons before the voyage begins.

SEC. 30. Should the ship by accident or any other cause be prevented from continuing the voyage, or by such causes is delayed on the voyage, the contractor (section 1) is bound to furnish the emigrants sufficient lodging and board, and to forward them and their baggage to the place of destination as soon as possible. This ordinance applies also to the forwarding from the transoceanic port of landing (section 26).

SEC. 31. Agreements contrary to the conditions of sections 27-30 have no legal force.

SEC. 32. The contractor can be compelled to insure his obligations arising from the sections 27-30, in a sum exceeding by one-half the amount of the passage money, or to deposit an amount sufficient to cover this sum.

SEC. 33. Contractors are responsible for the seaworthiness of the ships by which the emigrants are conveyed, as well as for their proper provisioning, as prescribed by law. These obligations also rest upon the commanders of the ships.

SEC. 34. Every emigrant ship, before entering upon its voyage, is subject to inspection as to its seaworthiness, outfitting arrangement, and supplies of provisions. This examination is conducted by official inspectors appointed by the respective governments.

SEC. 35. Before leaving port the emigrants and ship's crew must be examined as to their health by a physician appointed by the emigration authorities (section 40).

SEC. 36. The Bundesrath creates ordinances covering the condition, arrangement, outfit, and supplying with provisions of emigrant ships, the official inspection and control of the same, and the sanitary inspection of the passengers and crews before embarkation, the exclusion of sick people, the management of embarkation, and the protection of emigrants in regard to health and morality. The ordinances promulgated by the Bundesrath are to be published in the law paper of the Empire, and to be submitted to the Reichstag at its next sitting.

SEC. 37. As emigrant ships, in the sense of the law, are to be considered all vessels sailing to trans-European seaports and carrying—not considering the cabin passengers—at least twenty-five passengers.

VI.—*Authorities of emigration.*

SEC. 38. For the assistance of the chancellor in executing the duties and rights pertaining to his office in regard to emigration affairs a council of competent persons, consisting of a president and at least fourteen members, is created. The president is appointed by the Emperor, and the members are elected by the Bundesrath. Every two years a new election of members takes place. In general, the organization of the council is regulated by the Bundesrath, and its actions by a self-made order of business.

SEC. 39. This council must be consulted before permission is granted for enterprises the object of which is the settlement of particular parts of transoceanic countries, as well as in limiting or revoking the privileges of a contractor. Besides this, the Reichskanzler may bring before this council, for consideration, proper and important questions about emigration, and motions can be brought by the council before the Reichskanzler.

SEC. 40. For the supervision of emigration and the proper execution of the ordinances thereof, emigration authorities are to be appointed by the respective governments in seaports where contractors have received permission to transact business.

SEC. 41. In the seaport the Reichskanzler causes the supervision of emigration by commissioners appointed by himself. These commissioners are empowered to assist in the inspections provided for in section 34; also to undertake independent inspection of emigrant ships. They have to call the attention of the authorities to discovered discrepancies and offenses and insist upon their being remedied. The commanders of emigrant ships are compelled to give the commissioners, when asked for, a truthful statement about all the circumstances connected with the ship and the voyage, and to permit them at any time to enter the ship's rooms and examine the ship's papers. In foreign countries the duties of the commissioners for the protection of the emigrants are executed by the authorities of the Empire, to whom, if necessary, assistant commissioners can be attached.

VII.—*Forwarding from ports outside of Germany.*

SEC. 42. By order of the Emperor, the Bundesrath concurring, for the regulation of forwarding emigrants and passengers in German vessels sailing from other than German ports, ordinances of the kind mentioned in section 36 can be issued.

VIII.—*Fines.*

SEC. 43. Contractors who contravene the ordinances of sections 8, 22, 23, 25, 32, and 33, or the conditions to which the management of their business is subjected by the competent authorities, are liable to a fine of 150 to 6,000 marks (\$35.70 to \$1,428) or imprisonment up to six months. If the contraventions have been committed by an agent (section 9), the latter is fined; the contractor is also fined if the contravention has been committed with his knowledge, or if he has failed in the necessary care and supervision of his agent as far as it was possible under the circumstances. The same fine is imposed upon commanders of ships who fail in the duties under sections 33 and 41, or who contravene the ordinances issued under section 36, whether the contravention may have been committed in the inland or in foreign countries.

SEC. 44. Agents (section 44) who contravene the ordinances of sections 15, 16, 17, 22, 23, and 25, covering the regulations issued for the management of their business by the competent authorities, are subjected to a fine of from 30 to 3,000 marks (\$7.14 to \$714) or of imprisonment up to three months.

SEC. 45. Anyone forwarding emigrants without permission under sections 1 and 11, or assisting in such business, is fined with imprisonment up to one year and in the penal sum of 6,000 marks (\$1,428), or with either of these fines. The same fine is imposed upon those who make it a business to induce emigration.

SEC. 46. Whoever contravenes the ordinance of section 26 is punished with a fine up to 100 marks (\$23.80) or with imprisonment.

SEC. 47. Contravening the ordinances of section 42 is punished with a fine of from 150 to 6,000 marks (\$35.70 to \$1,428), or with imprisonment up to six months.

SEC. 48. Whoever induces a female to emigrate with a purpose of prostitution, by concealing this purpose, is subject to imprisonment up to five years. Besides the jail punishment, the loss of civil honor and rights is pronounced, at the same time a fine of 150 to 6,000 marks (\$37.50 to \$1,428). Subjection to police supervision can be imposed. The same punishment is imposed where persons induce female emigration for purposes of prostitution, even where the purposes are made known to such females. Under mitigating circumstances the punishment may be reduced to not less than three months' imprisonment and a fine of 150 to 6,000 marks (\$35.70 to \$1,428).

Final ordinances.

SEC. 49. The central authority of the Bundesrath will designate the authorities meant by supervising, administrative, and police authorities.

SEC. 50. This law will go into force April 1, 1898, and at the same time all ordinances issued under various laws of states for the permission of forwarding emigrants or assisting in same.

ITALY.

The Italian legislation of January 31, 1901, is modeled closely after that of Germany. It provides for the appointment of a commissioner of emigration and subordinate officers, makes regulations for the protection of the emigrant and his support in case of delay on the part of the steamship company, provides a penalty for false advertisements, and makes provision for the location of employment agencies in the countries to which immigration is most largely attracted. The obligation for military service continues abroad, but may be temporarily suspended during such residence. Italian citizenship is granted by decree to the sons of Italians born abroad or attaining majority abroad (cl. 33). The following is a translation of the Italian law:

ITALIAN LAW OF JANUARY 31, 1901, REGULATING EMIGRATION.

[Translation.]

SEC. I.—*On emigration in general.*

CLAUSE 1. Emigration within the limits prescribed by the existing laws is free.

All men liable to military service having completed or who shall within the year complete their eighteenth year of age, those entered for the naval service, and the soldiers of the corps of royal marines, may emigrate on obtaining due permission, in respect to the first from the prefect or subprefect, to the second from the port captain, and to the last from the commander of the corps.

All military men belonging to the first category of the army, not having completed their twenty-eighth year of age, may emigrate on obtaining permission from the district commandant, to whom proof must be afforded of being within one of the conditions to be specified in the code of regulations.

The emigration of soldiers belonging to the second and third category of the army and navy is free.

The emigration of soldiers of the first category belonging to the army is likewise free, on completing their twenty-eighth year of age, but until the completion of their thirty-second year of age same shall give due notice of their departure to the district commandant. Such notice to be drawn up on unstamped paper, free of charge, as prescribed by the code of regulations.

Such power to emigrate granted to soldiers by the foregoing paragraphs may in exceptional cases be temporarily withdrawn by royal decree on the proposal of the ministers of war and navy.

The minister for foreign affairs, acting in concert with the minister of the interior, has power to suspend all emigration to a given locality on public grounds, or whenever the life, liberty, and property of the emigrant be endangered thereby.

CLAUSE 2. Anyone enrolling, conducting, or sending abroad children under fifteen years of age to be employed in labour, without causing same to be submitted to medical examination and supplied with a mayor's certificate, in accordance with Clause 3 of the regulations on infant labour, September 17, 1886, shall be punishable with a pecuniary fine as prescribed in clause 1 of the act of 11th February, 1886, No. 3657.

CLAUSE 3. Anyone enrolling or receiving in charge within the Kingdom one or more children under fifteen for employment abroad, in itinerant professions or other trades classified in the code of regulations as being injurious to the health or dangerous, shall be punishable with confinement extending to six months, and a fine of one hundred to five hundred lire.

Same penalty shall be inflicted on anyone who shall conduct or send abroad, or consign to third parties for conveyance abroad, children under fifteen years of age for employment as stated in the first part of this clause. In such cases the guardian shall forfeit his guardianship and the parent may be deprived of his paternal rights.

Same provisions shall apply to anyone who shall induce a female under age to emigrate, to lead her to a life of prostitution.

CLAUSE 4. Anyone who in a foreign country shall forsake children under seventeen years of age, committed to their charge within the Kingdom for employment, shall be punishable with a term of confinement extending to one year, and a fine of three hundred to one thousand lire, irrespective of higher penalties in case of ill-treatment and bodily injury.

Should the child not have completed its fourteenth year, the penalty shall be increased by one-half.

The accused, subject or foreigner, shall be prosecuted on demand of the minister of justice or by an action brought by the party; and whosoever same shall have been previously convicted abroad for the same offence the provisions of clauses 7 and 8 of the penal code shall be applicable.

CLAUSE 5. The competent authorities shall transmit all applications for passports, and deliver same within twenty-four hours from receipt of such application, or voucher, with all documents required by regulations on the delivery of foreign passports.

All passports delivered to emigrants going abroad in search of employment, or to their families, and all deeds required for procuring same, are free from stamp or other dues.

SEC. II.—*On emigration to transoceanic countries.*

CLAUSE 6. Emigrants within the meaning of this present section are all subjects proceeding to countries lying beyond the Suez Canal, exclusive of the colonies and Italian protectorates, or to any country situated beyond the Straits of Gibraltar, the coast of Europe excluded, travelling third class or in such class as the emigrant commissariat shall declare equivalent to our present third class.

Emigrants not being Italian subjects taking passage in any port of the Kingdom are treated as subjects even in respect to provisions of clauses 21, 26, and 27, but same shall not be able to avail themselves of the assistance of the protection offices referred to in clause 12.

No passport is required by such as are not Italian subjects.

All passengers leaving of their own free will, and at their own charge, in third class or its equivalent, on board of Italian or foreign steamers, and journeying beyond the Suez Canal, will not be considered as emigrants unless such as are Italian subjects shall exceed fifty in number. When same shall exceed fifty a special permit of the commissariat will be required before same can be recognized as non-emigrants.

This rule can be suspended by royal decree.

Power is given to the minister for foreign affairs to provide by special arrangements for the protection of emigration which might be effected through the agency of sailing vessels.

Of the commissariat and its subordinate offices.

CLAUSE 7. Subject to the control of the foreign office department, a commissariat shall be appointed, to which all matters pertaining to emigration shall be referred.

Said commissariat of emigration to consist of a commissioner-general chosen among the higher state officials nominated by the minister for foreign affairs with the approval of the council of ministers, three commissioners appointed in accordance with the forms to be fixed in the code of regulations, and such other clerks as the service may require.

The salaries and indemnities of the members of the commissariat will be fixed by royal decree. Should same be chosen from any government office, same shall retain their rank and service rights to which same would be entitled in the department to which same belonged, and to which same can always return with the rank and years of service which same would have attained had they remained therein.

A board of emigration will moreover be formed, to consist of the commissioner-general as delegate of the foreign office department; five delegates of the departments of the interior, treasury, navy, public instruction, and agriculture; three members appointed by royal decree on the proposal of the minister for foreign affairs and chosen among such persons as shall have made the science of geography, statistics, and economy their special study; two members to be chosen in the manner prescribed by the regulations from among Italian subjects resident in Rome, one by the national league of Italian cooperative societies, and the other by the leading mutual aid societies of the chief towns of the Kingdom.

Said council shall be consulted in all matters of importance concerning emigration and in the transaction of business pertaining to various Government departments.

CLAUSE 8. Said commissariat is in correspondence with the authorities of the Kingdom, with emigration departments of other states, and with all other institutions, home or foreign, interested in the protection of emigrants.

Same shall have right to the free posting of its notices in every station or agency, on steamers, vans, and other means of transport by sea or land.

Each year, and not later than the month of April, the minister for foreign affairs shall present to Parliament a general report on emigration, accompanied by a report of the commissioner-general on the state of emigration, permanent or temporary, on the operations of carriers and their agents, on alterations in the existing regulations suggested by experience, and on all other matters concerning emigration.

Such report to be entered in the order of the day of the next sitting for discussion and adoption thereof.

CLAUSE 9. The minister for foreign affairs, in concert with the minister of the interior, shall appoint in the ports of Genoa, Naples, and Palermo, and in such other towns as shall be determined by royal decree, an emigration inspector, invested also with the quality of police officer, and selected from the staff of the department of the interior.

Said inspector shall act in the manner prescribed by the regulations, and shall superintend the care and inspection of passengers' luggage both on their departure and return.

CLAUSE 10. In all places where emigration exists, district or commune committees of emigration, unpaid, may be appointed, to consist of the chief magistrate (prator), or, failing such, of the petty judge, of the mayor or his deputy, of the parish priest or other minister of religion, of a doctor (the three latter to be appointed by the commissariat), and of a representative of the local trade or agricultural societies, chosen by the town council.

All elective members to retain office for three years and to be reeligible.

Said committee to be presided by the chief magistrate or in his absence by the mayor.

CLAUSE 11. On all ships carrying emigrants, the doctor, or one of the doctors on board, shall belong to the royal naval medical staff, on active duty on half pay, same to be appointed by the minister of marine on demand of the commissariat. Such doctors to be likewise charged with the duty of exercising their vigilance on board in the interests of emigration, in accordance with the rules to be enjoined by the code of regulations. Same shall be paid from the emigration fund to which the carrier shall pay in all amounts due to same in such proportion as will be established by the regulations.

The carrier is under obligation to provide such doctors, on the return journey as well, with board and first-class cabin free of charge.

CL. 12. In all States to which Italian emigration is more preferably attracted special offices will be opened by the minister for foreign affairs, and whenever necessary by arrangement with the respective governments for the purpose of affording protection, information, and assistance in procuring employment.

The minister for foreign affairs shall appoint, in accordance with rules to be fixed by regulations, travelling emigration inspectors in all transoceanic countries. Same shall have power to delegate such duty to consular officials as well.

Such inspectors shall report to commissariat on the conditions of Italian emigration the requirements of which same shall duly note and transmit.

In all ports, whether of transit or destination, regular inspections will be made on board of ships conveying emigrants by travelling inspectors or consular officials, in accordance with rules to be fixed by regulations.

On carriers of emigrants and freights.

CL. 13. No one shall enrol or engage with emigrants or promise or sell passage tickets without having first obtained from the commissariat a licence as carrier of emigrants, and a further special licence of said commissariat, subject to required security, in the case of emigrants having a free or partly free ticket, or in whatsoever other manner favoured or enrolled.

Such licences in the case of owners or otherwise of steamers fulfilling all requirements of clause 32 will be granted to—

- (a) Italian steamship companies;
- (b) Foreign steamship companies duly recognized within the Kingdom, in accordance with clause 230 and following of commercial code;
- (c) Italian shipowners trading individually or collectively;
- (d) Foreign shipowners and home and foreign freight owners.

All deeds of formation of foreign steamship companies shall, proportionately to the amount of respective capital, shall be subject to a fixed registration fee of five hundred to three thousand lire. Subsequent deeds authorizing increase of capital will be registered on payment of a fixed duty, amount of which shall be in proportion to duty paid on deed of formation, with regard to original capital of the company.

Such licences will be granted to foreign companies, shipowners, and freight owners only on condition that same shall appoint as their agent an Italian subject resident in the Kingdom, or a legally registered Italian firm, and that same shall submit to all laws and regulations of the Kingdom in all that concerns emigration operations and consequent acts.

Such licenses to be valid for one year, and subject on every renewal to a grant fee of one thousand lire, and guaranteed by a deposit in Government shares to the amount of three thousand lire or more of interest value, to be fixed by the minister for foreign affairs in proportion to the importance of the transaction.

All applications for such licenses shall imply full acceptance of all duties devolving on the carrier by effect of this law.

The minister for foreign affairs, under advice of the council of emigration, has power by substantiated decree to refuse, limit, or withdraw such licence.

Such deposit is held primarily as a guarantee for the due fulfilment of all obligations of the carrier or his agent in respect to emigrants and their representatives; and secondly, for due payment of all pecuniary fines incurred by said carrier or his agent by reason of such law. Such deposit to be made up to original amount whenever same shall have undergone any reduction, under pain of forfeiture of licence; same to be restored, saving in the case of pending judgement, six months after such carrier shall have ceased to act as such.

CL. 14. All freight charges which carriers propose to exact from emigrants shall be subject to approval of said commissariat.

Not later than November 15, March 15, and July 15 of each year such carriers shall forward their respective tenders to said commissariat. Same shall duly provide for approval of such freight rates, under advice of the chief department of the mercantile navy, and the boards of trade of the leading Italian maritime cities, with due regard to all information supplied by emigrant inspectors and Italian boards of trade in the principal centres of Italian emigration; as well as of such respecting rate of freights in all leading foreign ports, drawn from periodical reports to be supplied by Italian consular agents.

Whenever a tender is not accepted the commissariat is under obligation to invite the carrier to afford explanations within a reasonable term, upon which same shall forward all documents, together with substantiated proposals, to the higher naval board which shall duly express its opinion on the case. Thereupon the minister for foreign affairs shall fix the freight charges with due reference to the transports to be effected and the class and rate of speed of steamships.

Both in respect to freight rates duly accepted and of such as are by him established the minister for foreign affairs shall give notice to Parliament by means of special report, to which all such opinions and information aforesaid shall be annexed.

As a rule the scale of freight charges shall be fixed every four months, viz, on January 1st, May 1st, and September 1st of each year, and shall remain valid for the ensuing term of four months. Power is reserved, however, whenever necessary, on the proposal of the carriers or at the request of the commissariat to alter such charges, and during such term, with the same forms with which they were originally

fixed, and under same form of procedure power is reserved even within such term of four months to fix freight charges to be required of new carriers.

All freight rates to be made public not more than fifteen days prior to their application, and in the case of an extraordinary revision within the shortest time possible.

Said commissariat shall notify such rate of freights thus agreed on to all committees, district and communal, and likewise notifying to same all tenders for transport at lower rates of all carriers so requesting, and to whom in default of local representatives of such carriers. Said committees shall direct all emigrants through the medium of emigration inspectors aforesaid.

All carriers exceeding the freight rates settled and agreed upon, or who shall refuse to carry emigrants at such rate, shall be deprived of their respective licences, which shall not be restored except by decision of the minister for foreign affairs.

Said carriers shall not have power to raise the scale of freights charged to emigrants already publicly notified, or stated on passage ticket, or by equivalent entry.

Whenever a reduction on the rates made public or agreed upon is intended such reduction to be extended to all emigrants shipped for same passage.

CL. 15. In the event of a coalition between carriers to refuse the transport of emigrants at the rate fixed and agreed upon Government is empowered to authorize local committees to act in place of the agents of such carriers; and shall have power, by special concessions to other companies, shipowners, or freight owners, home or foreign, to authorize the shipping of emigrants, and the transshipment in foreign ports on this side of the ocean, and to employ all other suitable means for the protection of emigration.

Such cases occurring the carrier will be deprived of his licence, nor shall same be restored except by duly substantiated decision of the council of ministers. In case of second offence the licence to be finally withdrawn.

CL. 16. All carriers of emigrants may, by letter addressed to the commissariat, who shall take the advice of the competent magistrate, appoint personal agents, for whose actions in matters concerning emigration same shall be civilly responsible. Same to be likewise responsible for all acts of his subordinates, as well as of other carriers or any other person to whom same shall have entrusted, with or without the connivance or consent of the emigrant the transport thereof, wholly or in part. All conditions excluding or restricting such responsibility, even when accompanied by a reduction in the freight charges, shall be void.

Power is given to commissariat to refuse by substantiated decree its assent to the appointment of an agent, and by a similar decree to revoke an assent already granted.

Such agents shall be Italian subjects, and will not be allowed to delegate their power to other persons.

By mutual arrangement, to be notified to commissariat, several carriers may appoint one sole agent.

Agents are strictly forbidden to procure shipment for emigrants on vessels other than those of their own principal or principals.

CL. 17. The carrier and his agents are forbidden to entice emigration in public.

All prescriptions of clause 416 of penal code being maintained, whosoever shall by means of public notices, circulars, or guidebooks concerning emigration, wantonly spread false news or information, or shall distribute within the Kingdom news and information of a like nature published abroad, shall be punished with a term of confinement extending to six months and a fine extensible to one thousand lire.

All circulars and notices of whatsoever kind issued by carriers shall indicate gross and net tonnage and average speed of steamships, date of departure, landing ports, and duration of the entire outward journey.

CL. 18. The minister for foreign affairs in concert with the minister of the interior has power, under special conditions, to allow any private individual to enroll on his sole account any number of persons as he may require for the execution of any given work abroad, or for any colonial undertaking allowed by the laws of the country in which it is to be carried out, on condition that such individual, in the case of emigration to countries referred to in clause 6, shall employ the services of a licensed carrier for the transport and that such carrier shall pay the duty fixed in clause 28.

In the case of journeys to countries unfrequented or slightly visited by Italians, the minister of foreign affairs has power to allow under given conditions, that the shipment be made by shipowner not possessing the qualification of carrier of emigrants.

CL. 19. No carrier or his agent shall deliver passage tickets to Italian emigrants unless same are able to produce passports.

To all emigrants favoured, enrolled, or leaving of their own free will, having arranged for their passage in any place other than the place of abode of such carrier, same or his agent are bound to provide passage tickets not exchangeable for other document until such emigrant has quitted his place of abode for the port of embarkation.

Exception made for carriers authorized by the commissariat: All are forbidden to

deliver orders whereby emigrants are to be supplied with railway tickets in their country of destination, unless such tickets be free and deliverable at time and place of departure.

All passage tickets for the use of emigrants, considered as such in accordance with clause 6, are free of stamp and registry duty.

CL. 20. Any ticket sold abroad by any carrier or by others on his account, and made out in the name of any emigrant embarking within the Kingdom, shall entitle such emigrant (on favorable report of emigration inspector of the port of departure) to accommodation on board of the first steamer belonging to such carrier leaving place of destination shown on the ticket, in spite of all contrary declaration contained in such ticket.

All provisions of this present law shall equally apply to all emigrants traveling under the conditions provided for by this clause.

CL. 21. All carriers and their representatives are forbidden to receive from emigrants any gratuities of whatsoever nature over and above the passage money; said emigrants to have right to restitution of double the amounts unduly paid, and compensation for any damages.

All passage money wholly or in part prepaid by any emigrant for himself or his own family shall be refunded, should same be prevented from starting owing to certified illness of self or any member of his family living with or to travel with same; or owing to railway delay, or under any circumstances accidental or otherwise ascribable to carrier or vessel.

In all cases of emigration however favoured or enrolled, and whenever such emigrant for any of above reasons or owing to same not being accepted by party having ordered his enrollment, or because of his rejection by inspection committee, shall be under the necessity of returning from port of embarkation to his home, or to the frontier in the case of foreigners, said carrier to defray all expenses for sheltering, maintaining, and journeying of such persons, as well as transport of baggage, saving all rights of such emigrants to compensation for damages, if any.

Moreover, when for any other reason whatsoever and prior to the departure of the vessel said emigrant shall rescind his contract, all provisions of clause 583, No. 2 of commercial code, being duly observed, same to be entitled with the approval of emigration inspector to the restitution of a moiety of the passage money, besides cost of nourishment for the estimated duration of the journey, wherever same have been included in the passage money.

Finally, should said emigrant, to whatsoever category he may belong, have lost his passage through delay of a train, even when owing to circumstances beyond control, the railway companies to be under obligation to convey same and his baggage back to his station of departure, or frontier station in the case of a foreigner, whenever same shall personally apply for and obtain from the emigration inspector a duly certified order for a pass, to be presented within twenty-four hours at the starting office.

CL. 22. The cost of nourishing and lodging all emigrants on their arrival at their port of embarkation to be chargeable to carrier from midday of the day preceding that fixed for departure as stated on ticket until such day wherein such departure shall take place, whatsoever be the cause of delays.

All emigrants to whom any delay shall have been notified after being supplied with tickets and prior to same leaving place of abode shall be entitled to an indemnity of two lire per diem whenever a full berth has been retained, and in due proportion for the half or quarter, until midnight of the day but one preceding that on which the departure shall occur.

Whenever such delay shall exceed ten days said emigrants are entitled to give up the journey, recover their passage money if already paid, and to claim from board of arbitration referred to in clause 27 compensation for damages, if any.

In all cases in which said emigrants by reason of the vessel or owing to quarantine regulations shall be under the necessity of breaking the journey at any intermediate port, the expense of feeding and, where necessary, of lodging same shall be defrayed by the carrier, who in the event of shipwreck or inability of steamer to proceed, or from stoppage due to accident exceeding fifteen days, shall be under obligation to send another steamer capable of accommodating and conveying said emigrants to the place of destination. Failing which the minister for foreign affairs, after consulting the board of emigration, shall provide accordingly from the deposit.

All agreement by which emigrants shall relinquish their claim to indemnity fixed by present clause is void and of no effect.

CL. 23. The embarkation of emigrants shall be effected by carrier in such ports as are indicated in first section of clause 9.

Reservation made for all cases beyond control: The landing of emigrants in foreign ports not situated on the other side of the ocean is forbidden, as likewise is the sending of emigrants to any non-Italian port for the purpose of embarkation. Infringements of this rule in either case and in the sole exclusive interest of said emigrants are authorized by special permission of commissariat.

CL. 24. All carriers are responsible for any loss sustained by emigrants who are prohibited from landing in the country to which same are bound in consequence of local existing laws on immigration, whenever there be satisfactory proof that such carriers were acquainted before starting with the circumstances giving origin to the prohibition aforesaid.

CL. 25. Whenever the steamer on its return journey shall touch at an Italian port, the carrier, in spite of any agreement to the contrary, is bound to convey at a daily charge of two lire a head per day, board included, all distressed Italian subjects who, to whatsoever cause owing, shall be returning to their home by arrangement and request of a diplomatic or consular agent, to the number of ten (full berths), on steamers of less than a thousand tons, with an increase of one for each additional two hundred or fraction of two hundred tons, the aggregate number of same not to exceed thirty. Children above three years and under twelve to pay one lira a day, and infants under three nothing.

On matters of dispute between carriers and emigrants.

CL. 26. Emigrants have power to institute proceedings for the recovery of sums, claims for damages, and all other matters of dispute arising from the present law, against the carrier or his agent, by application drawn up on unstamped form, addressed to a royal consular official or to any Government office for the protection of emigrants abroad, or, whenever the departure shall not have taken place, to the prefect of the province, to the emigration inspector, or to the committee of such place where the agreement was made or the embarkation was to be effected.

Such application, if abroad, to be made within six months from date of arrival at port of destination, or other port, should said emigrant have been unable to reach same; and if in the kingdom within three months from date of departure given on the ticket.

In all cases in which said emigrants shall have been compelled to return to Italy, without having been able to communicate with any royal authority or office for protection, said term to begin from date of their landing in the Kingdom.

CL. 27. All matters of dispute arising between carrier and emigrant as per foregoing clause shall be decided, without right of appeal, by a board of arbitration established in the chief provincial town.

Said board to consist of the president of the tribunal or his deputy, who shall preside, of the royal attorney, of a councillor of the prefecture, and of two members appointed by the provincial council.

In case of impediment the president of the tribunal and royal attorney have power to appoint deputies, which in the case of the former shall be a vice-president or one of the judges, and in the case of the latter his substitute.

For the legal requirements of the proceedings the emigrant shall be held as having his abode in the prefecture to which such application shall have been made or forwarded.

Such application to be accompanied by reports and proofs drawn up or collected by consuls, protection offices, traveling commissioners, emigration inspectors, and local committees.

Said board of arbitration of the province wherein said emigrant shall have taken his passage to be competent in spite of all agreement to the contrary; same not to be bound to observance of forms and terms established for preparation of cases to be tried before the judicial authorities, or to notifying of verdict; same to render judgment in accordance with forms of procedure to be indicated in code of regulations, which shall further make provision for notifying of verdict. Thereupon said commissariat shall draw the necessary sums from amount of security and distribute same to whomsoever due in accordance with verdict.

Should such emigrants to be indemnified be abroad at the time, such sums to be delivered to commissariat, by whom same shall be duly remitted at carrier's expense.

All papers and deeds having reference to the case, including verdicts, to be exempted from stamp and registry duties.

Proceedings being concluded, the prefect shall forward all papers pertaining thereto to the royal attorney, in order that same may examine and decide if there be ground for penal prosecution.

All litigation in respect to sums or valuables not exceeding fifty lire, arising at place of embarkation, whether between emigrants and carrier or between emigrants and inn-keepers, or boatmen, or porters, or any other persons whose services shall have been required by said emigrants, to be settled by said emigration inspector, same to provide, without formalities of judgment, on due hearing of the adverse sides, or even in the absence of such one as, though duly summoned, shall have failed to appear.

Same shall draw up a special report on the entire case on the evidence of which decision will be issued having immediate effect. Against such decision no opposition or appeal is allowable.

Emigration fund.

CL. 28. Carriers shall pay to deposit and loan fund of any branch of the royal provincial treasury the sum of eight lire for each whole berth, four for each half and two for each quarter berth. To same fund shall be paid all license fees, pecuniary fines, and all future receipts originating on this bill.

Such payments to be devoted to the constitution of an emigration fund, to be invested in securities issued or guaranteed by government, in respect to such share of same as shall not be required for defraying the ordinary expenditure incurred for the purposes of emigration.

Such share thus reserved to be held by the deposit and loan fund in account current; interest at same rate allowed on voluntary deposits, fixed in accordance with clause 44 of regulations of 9th December, 1875, No. 2802.

All amounts drawn from such current account to be by order of general commissioner with assent of the minister for foreign affairs, same to be expended solely and entirely on behalf of emigration at home or abroad.

The balance sheet of said emigration fund, containing all expenditure on account of said commissariat and sections depending therefrom, in accordance with forms fixed by regulations, shall each year be submitted to Parliament, who shall examine and approve same by special vote.

Said emigration fund is placed under the control of a permanent board composed of three senators and three members of Parliament, to be appointed in each session by respective house. Same to retain their place on the board even during the recess between Parliaments and sessions. Said board to issue every year a report to be presented to Parliament by the minister for foreign affairs.

SEC. III.—General rules.

CL. 29. The minister for foreign affairs, in concert with the minister of the interior, has power to impose measures for the protection, and special guarantees for the enrolment, of emigrants not included in Section II of this bill if carried out by commercial agents, companies, private citizens, or foreigners, with stipulated conditions in respect to work, wages, time, or place.

In the case of such enrolments, and provided due claim shall have been made on the part of the emigrant or his agent, pending the execution of a contract, or within ten days from the completion thereof, or within ten days from striking work, the assessment of damages in accordance with arbitration procedure given under clause 27 shall be allowed, the conditions for eventual tender of deposit and recovery of guarantee to be fixed on each occasion in accordance with each separate enrolment.

The minister for foreign affairs has power (under clause 12, paragraph first, of this bill) to appoint emigration inspectors travelling abroad, in all other chief centres of Italian emigration, besides those countries lying across the ocean.

Committees as per clause 10 shall exercise their office equally in favour of emigration not directed towards any country lying across the ocean.

CL. 30. All boards of arbitration as per clause 27 are competent to pronounce judgment in respect to refunding of any amounts claimed by any royal authority, in or without the Kingdom, for expenses incurred by same in the interest of emigrants, whenever the responsibility shall be traceable to carriers, agents, companies, commercial agents, or private individuals, respective security to be available for such repayments.

Penal enactments.

CL. 31. Saving provisions of first paragraph of following clause, the following are punishable:

- with term of arrest extending to six months and fine not exceeding one thousand lire, all such as shall incite or favour the emigration of one or more persons, in opposition to laws and regulations, and contrary to prohibition of the minister for foreign affairs as enjoined by clause 1, concluding paragraph;

- with fine not exceeding three hundred lire all contravening clause 1;

- with term of arrest not exceeding three months and fine not exceeding one thousand lire all acting in contravention to preliminary portion of clause 13;

- with fine not exceeding one thousand lire any carrier insinuating, between himself and any emigrant, other brokers than his own duly authorized agents; and with same penalty any carrier or agent of same who shall declare as emigrants of their own free will, travelling with their own money, any person whose passage shall have been entirely or in part paid by foreign governments or private contractors; and in case of second offence with a fine of two thousand lire or under;

- with fine not exceeding one thousand lire all acting in contravention to concluding paragraph of clause 16, whom the minister for foreign affairs has power to inhibit, for the time being or altogether, from all part in emigration operations,

with full reservation for any responsibility incurred by such agent in respect to such carrier or carriers by whom same shall have been appointed;

with fine not exceeding two thousand lire all acting in contravention to clause 23;

with fine not exceeding one thousand lire all contraventions to this bill or annexed rules, alike in the case of carriers, agents, contractors, commercial agents, emigrants not included.

Should the carrier be a steamship company, all penalties sanctioned by this bill against carriers shall be applicable to all such as have acted as agents of the company, and the due payment of all pecuniary fines incurred by same shall be guaranteed by security of the company aforesaid.

Copies of all orders and verdicts in respect to offences provided against by this bill shall be forwarded to the minister for foreign affairs, who, in so far as falls within his competence, shall provide accordingly to clause 13 with regard to license.

CL. 32. A code of regulations to be sanctioned, and to be altered whenever necessary by royal decree, with approval of the council of state, shall, besides those already referred to, contain full rules for:

distinguishing with reference to penalties sanctioned by clause 31 temporary from permanent emigration;

distribution of duties enumerated in clause 7 and relative expenditure, and for the regulation choice and salaries of such clerks as are strictly necessary;

preparing balance sheet of emigration fund;

deciding which of the offices depending from said commissariat shall be entitled to postal and telegraphic franchise;

determining standard of capacity and morality of carriers and their agents;

authorizing and regulating committees for protection and other institutions in behalf of emigration due to private enterprise;

appointing of all members by election of all district and communal commissions and establishing the duties thereof;

deciding in which cases and on what conditions the minister for foreign affairs shall have power to oblige carriers to convey missionaries charged with the care of emigrants;

regulating the protection of emigrants in ports of embarkation, even by the establishing of refuge homes, to be erected, as means shall allow, in the ports of Genoa, Naples, and Palermo; for determining mode of admission to such homes, medical inspections, baths, etc.;

enjoining that within two years from date of application of this bill the space now allowed to each emigrant in the dormitories of steamships employed in the conveyance of emigrants be increased to cubic metres 2.75 in the upper gangway and three cubic metres in the lower;

fixing certain rules whereby the average speed of vessels shall not be under ten nautical miles an hour;

arranging for due control of conditions regarding rate of speed and limiting the touching at intermediate ports of such steamers to such stoppages as shall be found absolutely necessary;

settling conditions on which steamers belonging to foreign carriers touching at Italian ports shall be exempted from inspections tending to verify if same are fitted in accordance with prescriptions of the Italian laws and regulations on presenting a document granted by competent authorities and duly authenticated by a royal consular official stating that such steamer shall fill the required conditions;

fixing the number of medical men on board proportionately to the number of emigrants shipped;

fixing the nature and quantity of food and accommodation, or corresponding indemnity in the case of delay in starting, or stoppages of emigrants in all intermediate ports whatsoever, or whenever said emigrants be rejected, on whatsoever grounds, at port of departure or destination; fixing the rations on board and all other matters tending to render the passage more satisfactory;

fixing the amount of luggage to be allowed to each emigrant, carriage free, and indemnity to be paid to same in case of loss or damage;

supervising treatment on board in respect to all Italian passengers, holders of third-class tickets or its equivalent class, returning home;

settling all measures for protecting emigrants journeying to frontier stations or others, whether enrolled, favoured, or travelling of their own free will, with or without previous engagement with carriers or their agents;

calling attention to services rendered by such as, in local committees, arbitration boards, emigrant committees of protection, and other such gratuitous appointments, shall have been instrumental in furthering the aims proposed by this bill;

settling, in conclusion, all matters having reference to the sanitary welfare and due safety of emigrants.

SEC. IV.—*Special provisions in regard to military service and nationality.*

CL. 33. To clauses 81 and 82 of single code of laws on the recruiting of the army, and 36 of single code on maritime levies, the following to be substituted:

All operations in respect to levies abroad to be entrusted to the royal diplomatic and consular authorities.

All being liable, permanently settled abroad, may undergo inspection in the royal legation or nearest royal consulate, same in accordance with result of such inspection to be enrolled under their proper category or remanded for future inspection, or dismissed, or remanded to a future levy on account of justified impediment.

All being liable, born and residing abroad, or having left their country before having completed their sixteenth year, in America, Australia, Asia (Turkey excepted), Africa (Italian dominions and protectorates, Egypt, Tripoli, Tunis, Algiers, and Morocco excepted), when enrolled, to be temporarily exempted from presentation while such residence abroad shall continue. In case of general mobilization of the army and navy, same to be under obligation to present themselves, saving such exceptions, to be stated in such event, in respect to possibility of same being able to return home within the given time.

All military men as above, on their return to the Kingdom, shall at once notify same to military district if assigned to the land force, or to the office of the commandant of the port if belonging to the navy, and present themselves for fulfilling their military duties. Any contravening to such rules shall be declared deserters.

Same to be able, however, in exceptional cases, to obtain from any royal diplomatic or consular authority leave to return to their native country and remain there for a term not exceeding two months. The war minister has power on each occasion, and in accordance with code of rules, to extend such leave to remain within the Kingdom to all such as shall show proofs of following a regular course of studies.

Such temporary dispensation as per paragraphs 3, 4, and 5 of this present clause to become absolute and final on full attainment of the thirty-second year of age.

CL. 34. Following clause 120 of the code of laws on the recruitment of the army, and corresponding clause 43 of the code of laws for the naval levy, the ensuing clause to be added:

All such as on being called for military service shall be resident students in any college of the Kingdom or Erythrean colony and training for a missionary's calling, or having been enrolled in the first category, shall be entitled to obtain, in time of peace, that such call for service be postponed till full completion of twenty-sixth year, such concession to become void on obtaining such age, or even sooner if such course of training has been abandoned.

Should same be proceeding abroad in the quality of missionaries, to such places and under such conditions as the minister for foreign affairs shall require, same to obtain all facilitations granted to such as, being liable to serve, are born and resident abroad.

CL. 35. Paragraph 3 of first part of clause 11 of civil code is annulled.

CL. 36. The Italian nationality, comprising the acquirement and enjoyment of all political rights possessed by natural-born subjects, may be granted by decree of the minister of the interior in concert with the minister for foreign affairs, to all born within the Kingdom or abroad, having become aliens from the fact of being younger sons of fathers having lost their nationality, or, born within the Kingdom or abroad, whose father shall have lost such nationality prior to birth of same, not having in accordance with clauses 5, 6, or 11 of civil code within a year of attaining their majority declared themselves Italian subjects, or, having expressly chosen to become foreign subjects, provided same shall make declaration to settle in the Kingdom.

SEC. V.—*Transitory rules.*

CL. 37. The date of coming into effect of this bill shall be fixed by successive royal decrees accordingly as the opening of the various branches of the service becomes possible. Said decrees to have for effect the annulment of bill of December 30, 1888, No. 5866, série 3, in respect to such parts of same as shall correspond to present bill, the coming into action of which to be determined by decrees, in such manner that all provisions herein contained shall have taken effect not later than a year from date of issue thereof.

CL. 38. Pending approval of code of regulations and appointment of the emigration commissariat, the minister for foreign affairs is empowered to entrust the temporary discharge of such duties to Government clerks.

T. VILLA,

The Chairman of the Chamber of Deputies.

AGRICULTURAL IMMIGRATION TO BRITISH COLONIES.

Desirable immigration.—Several British colonies have more or less energetic measures in vogue for the encouragement of immigration from the British Isles. The Australasian colonies each maintain agents-general at London, who, in addition to attending to the affairs of the colony, act as immigration agents. Canada maintains not only immigration agencies at London, but agencies throughout England, Scotland, Ireland, and Wales.

In addition to these colonial agencies Her Majesty's Government also has maintained an emigrants' information office at London, established in 1886, "for the purpose of supplying intending emigrants with useful and trustworthy information respecting emigration chiefly to the British colonies."

This information office issues circulars and handbooks respecting the several colonies of Canada, Australasia, and South Africa. These handbooks describe briefly the conditions in the colonies, demand for labor, cost of labor, wages, and the steamship fares and cost of migration.

The object of the British colonies, rigidly maintained, is only to encourage desirable immigration, and their legislation is strict in excluding undesirable classes. For these desirable immigrants two of the Australasian colonies, namely, Queensland and West Australia, provide free assisted or "nominated" passage. New Zealand provides reduced passage. The other colonies which formerly adopted these devices of encouraging immigration have suspended them.

The nature of this class of free passage may be gathered from the following account in the Australasian circular of the emigrants' information office respecting Queensland:

"Free and assisted passages.—The agent-general for the colony of Queensland has been instructed to offer free passages to foreign laborers and female domestic servants from 17 to 35 years of age who have never been otherwise engaged. One pound per adult will have to be paid for ship kit by those accepted. The agent-general is also empowered to entertain application for some assistance toward the total cost of passage of small capitalists, farmers, market gardeners, dairymen, fruit growers, and their families.

"Nominated passages (important to those who have friends in the colony).—Persons who have resided in the colony for six months can nominate others who have been duly approved by their relatives or personal friends for free passages upon application to the government immigration agent at Brisbane, Queensland, and upon making the following payments to him there.

"Males from 1 to 12 years of age, £2; from 12 to 40, £4; from 40 to 55, £8; females from 1 to 12, £1; from 12 to 40, £2, and from 40 to 55, £8.

"N. B.—Only female domestic servants, farm laborers, plowmen, and gardeners are eligible for nomination. Neither mechanics nor artisans are eligible to be nominated, nor more than 2 children under 12 years of age of the same family, nor any person above the age of 45 years, unless especially sanctioned by the minister. Nominated emigrants must remain in Queensland for one year, and must not have previously resided in any of the Australian colonies."

Nominated emigrants are met by their friends at the government emigration depots, and may obtain board and lodging for a few days free of expense. They are then forwarded by railway to their respective destinations free of cost. "A bona fide intending selector of an agricultural selection wishing to inspect land before selection may obtain a selector's ticket to the nearest railway station upon payment of the ordinary fare. If he does subsequently select an agricultural selection, the price of his ticket will be refunded to him and free passage will be given him for the carriage of himself and family (if any), ordinary household furniture, agricultural implements, and effects to the railway station nearest to his selection."

There were 895 nominated and full-paying emigrants to Queensland in 1898, two-thirds of whom were farm laborers or domestic servants. In 1900 three-fourths of the entire immigration, numbering 2,161, were free passengers, and only 251 paid full steerage fare. The Government suspended free immigration temporarily in 1900 owing to the drought. The number of "nominated" immigrants is increasing, the nationalities being mainly Irish, English, and Scotch. The nominated system is reported by the officials of both Queensland and West Australia as working very satisfactorily. It is also advocated by immigrant agents of Canada as preferable to free and assisted passages. The guarantee given by the nominators, who must be settled residents of the colony, protects the Government against the expense of maintaining the new arrivals, and the classes of people introduced are mostly of a very superior character.

The Australasian colonies maintain employment agencies and labor bureaus, part of whose express duties is the assistance of immigrants and finding employment. New Zealand furnishes no free nominated or assisted passages, but for certain classes provides reduced passages. These are such as have fixed incomes or a capital of at least £100, with £50 additional for each member of the family over 12 years. The

regular fare by sailing ships from England to New Zealand for third class is £15 15s. to £19 19s., but the reduced fares to New Zealand are £14 14s. New Zealand does not maintain an immigration depot, but immigrants obtain information as to rates of wages through the Crown land officer. The following is a table showing the fare by sailing vessels and by steamer from England to Sydney, New South Wales. The rates are practically the same to other colonies of Australasia.

	By sailing vessel (about 3 months) occasionally.	By steamer (from 42 to 50 days).
Third class.....	£14 14s. to £18 18s.
Second class.....	About £20.....	£35 to £40.
First class.....	About £52.....	£42 to £70.

CANADA.

Of all British colonies Canada at the present time is carrying on the most expensive and systematic agitation in Great Britain for the inducement of immigration to the farming lands of the several provinces. There is maintained at London a high commissioner, with agents in different parts of the country and on the Continent. These agents spend their time in traveling through the country and lecturing on the advantages of Canada, and in advertising through the press. A large number of agencies is also maintained at points in the United States.

During the 6 months, January to June, 1900, the superintendent of immigration distributed through these agencies 1,050,500 pamphlets, circulars, copy books, and newspapers, in English, French, and Hungarian languages. The department of the interior has met the expenses of various delegates from different countries who have visited Manitoba and the Northwest and made reports upon their impressions of the country and its desirability for immigrants. These delegates have included a number of tenant farmers from England, a Russian delegation, and a Finnish delegation.

The immigration agencies in Europe work in cooperation with the steamship agents and with the Canadian Pacific Railway Company. At the same time, it is complained that the expense of migration from England to the northwest of Canada exceeds that to the western part of the United States.

An interesting feature of the educational campaign of the immigration agents in Great Britain is the preparation of "copy books" for use in the schools. It is stated that "the constant use of the copy books by the children can not fail to impress upon their minds facts relating to Canada that they are copying day by day, and we hope also that the introduction of these books into many homes in the different parts of the United Kingdom will be attended with the best results." The present of a brass medal for competition in each school is offered when the schools close for the Christmas holidays to the boy or girl who proves to be the most proficient in the subjects. The Canadian government does not provide free or assisted passages, but directs its energies solely to the educational lines of spreading information throughout Great Britain of the advantages of the country. At the same time the agents make it a part of their duties to personally conduct parties of immigrants across the water to Quebec, whence they are taken in charge by the officers of the railway and the domestic branch of the commission of immigration.

The activity of the latter branch of the bureau of immigration may be inferred from the report of the commissioner for Winnipeg for 1900. This commissioner has under his supervision interpreters in Icelandic, German, French, Finnish, and Ruthenian. He also has traveling agents, who visit the colonies of immigrants and assist them in such ways as is needed. In this way the agencies have located the colonies of Doukhobors, who had migrated from Russia on account of their dislike of military service. These are described as exceedingly desirable colonists. The Galicians or Ruthenians have made satisfactory progress. The agent states that the first 9 Galicians who settled in Canada in 1894 possessed \$1,294, and in February, 1900, their total capital was \$31,278. The Russian-Moravian, with 25 families, threshed, in 1889, 18,000 bushels of grain and owned 300 cattle. The Russian colony, Burdserfeld, comprising 45 families, threshed 50,000 bushels of grain and owned 500 cattle. A German colony, comprising 125 families, produced 300 bushels of grain and has 40 public schools and 2 churches. The French colony of 100 families and the Swedish colony have also succeeded well.

The vacant lands taken up by these immigrants are partly Government land and partly land of the Canadian Pacific Railway and the Hudson Bay Company. The land entries for the half year ending June 30, for the last 4 years, are as follows: 1897, 1,272; 1898, 2,541; 1899, 4,573; 1900, 4,266. The sales of the Canadian Pacific Railway for the 6 months from January to June, in 1899, were 182,836 acres, or in 1900, 268,628. The Hudson Bay company sold, in the first 6 months of 1900, 34,629

acres for \$173,913. The total expenditure of the Dominion Government in behalf of immigration is something like \$250,000 per year. It is estimated that 12,000 of these are Americans and that three-fourths of the total immigration is directed to the search of free lands in the Northwest. The following table shows for the first 6 months of 1900 the immigrant arrivals by countries of origin:

United States.....	8,543
English and Welsh.....	4,129
Scotch.....	609
Irish.....	343
	5,141
Galicians, etc.....	4,992
Germans.....	476
Scandinavians.....	714
French and Belgian.....	253
Miscellaneous nationalities.....	3,776
Total.....	23,895

The Canadian agencies in the United States are the most extensive and energetic of all the agencies under the supervision of the immigration service of Canada. The principal ones are located at Detroit and Saginaw, Mich.; Chicago, Ill.; Stevens Point, Madison, and Milwaukee, Wis.; Columbus, Cleveland, Toledo, and Sandusky, Ohio; Logansport and Indianapolis, Ind.; Louisville, Ky.; St. Louis and Kansas City, Mo.; Omaha, Nebr.; Sioux Falls and Watertown, S. Dak.; Des Moines, Iowa; St. Paul and Duluth, Minn.; Grafton, N. Dak.

The literature published by the department has had the most extensive circulation throughout every State in the American Union. The demand for the atlas of western Canada was so great that the large supply in 1889 became soon exhausted. Circulars and pamphlets which are distributed are entitled "Western Canada," "Settlers' Experiences," "Delegates' Reports," "The Hard Wheat Belt." An extensive system of advertising is carried on throughout the local and foreign papers, using reading notices as well as regularly displayed advertisements, and changing frequently in order to attract public attention. The agents conduct a series of lectures with lantern slides, and visit the individual farmers, explaining to them the advantages of immigration to Canada and the expenses, etc. Their efforts are directed mainly to securing American farmers who have already shown their desirability by the success they have made in their own country. In the spring of 1900 several delegations were provided with free transportation to Canada and return to their localities, and their influence is described as satisfactory. From Missouri more than 80 delegates were sent in the season of 1900. In one train from Kansas and Missouri 200 souls, with 23 cars of settlers' effects, moved to the Canadian Northwest. Another company of families moved from Nebraska overland in "prairie schooners," a trip of 600 miles, to the Canadian Northwest. These colonists were in all cases the direct result of the solicitation of the Canadian immigration agents.

An interesting feature of Canadian immigration is that of dependent children whose migration is assisted by British public or private authorities. The boards of guardians of British poor-law districts are authorized to assist the migration of pauper children at the public expense provided a stated sum be paid to the Canadian minister of interior for the inspection of such children up to the age of 16. This sum ranges from £1 4s. 8d. for each child of 14 and 15 years up to £10 14s. 9d. for each child of 4 and under 5 years. Under these regulations, the following table shows the number of children deported to Canada by the public authorities from the years 1889 to 1898:

Year.	Total numbers.	Number of children included.	Total cost to the guardians.
1889.....	558	428	£5,266
1890.....	447	375	4,482
1891.....	339	296	3,725
1892.....	381	322	4,055
1893.....	398	360	4,596
1894.....	344	299	3,879
1895.....	292	246	3,154
1896.....	228	207	2,762
1896.....	99	85	1,147
1897.....	90	78	1,109
1898.....			

In addition to the public authorities deporting children there is a large number of private children's emigration societies, among which the following are the more important: Children's Immigration Homes, Birmingham, founded 1872, forwarded 2,761 children to Canada during 17 years; The Sheltering Home, Liverpool, forwarded 3,700 children in 27 years; Canadian Catholic Immigration Society, London,

sends Roman Catholic boys and girls to Canada; Childrens' Home and Refuge, London, forwarded 1,525 children to Canada during 30 years and 49 to other colonies; The Church of England Incorporated Society for Providing Homes for Waifs and Strays, London, forwarded 650 children to Canada; National Waifs' Association, London, otherwise known as Dr. Bernardo's Home, forwarded up to the end of 1899 10,660 children to Canada. The cost of immigration, including outfit and all journeying expenses, is £10 per head. The association has a distributing home at Toronto for boys, at Petersborough for girls, and a small center at Winnipeg, an industrial farm of 10,000 acres at Russell, in Manitoba, to which older lives were sent. The children are placed out with the farmers and others, and a lad who has saved \$150 and takes up a free homestead is provided with a house, provisions, and farm machinery, the expense of which he pays back in easy installments.

Manchester and Salford Boys' and Girls' Refuges and Homes and Childrens' Aid Society, Manchester, forwarded 1,300 children to Canada, of whom 40 were sent in 1899.

The Salford Catholic Protection and Rescue Society, Salford, forwarded 707 children in the last 10 years. They are taken to the Province of Quebec and placed out with farmers and others, all of whom are Roman Catholic French-speaking Canadians.

CHINESE EXCLUSION.

The proposed continuation for another ten years of the law excluding Chinese laborers, which expires by limitation in 1902, suggests comparison with legislation on Chinese immigration by the English-speaking colonial provinces of Great Britain, which, like the United States, are open to the influx of that nationality. Following is the text of the Canadian act of 1900 and a summary of legislation in Australian colonies:

CANADIAN ACT RESTRICTING CHINESE IMMIGRATION, 1900.

[63-64 Victoria.]

CHAP. 32.—AN ACT RESPECTING AND RESTRICTING CHINESE IMMIGRATION.

[Assented to July 18, 1900.]

Her Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:

1. This act may be cited as the Chinese immigration act, 1900.
2. This act shall come into force on the first day of January, one thousand nine hundred and one.
3. The following acts are repealed: Chapter 67 of the Revised Statutes, chapter 35 of the statutes of 1887, and chapter 25 of the statutes of 1892.
4. In this act, unless the context otherwise requires—
 - (a) The expression "chief controller" means the chief officer who is charged, under the direction of the minister to whom is assigned the administration of this act, with the duty of carrying the provisions of this act into effect and who shall have authority over officers of customs and others appointed for the purpose or charged with the duty of assisting in carrying out the provisions of this act;
 - (b) The expression "controller" means any customs or other officer at any seaport or frontier customs port, duly appointed as such and charged with the duty of assisting in carrying the provisions of this act into effect;
 - (c) The expression "master" or "conductor" means any person in command of or in charge of any vessel or vehicle;
 - (d) The expression "Chinese immigrant" means any person of Chinese origin (including any person whose father was of Chinese origin) entering Canada and not entitled to the privilege of exemption provided by section 6 of this act;
 - (e) The expression "vessel" means any seagoing craft of any kind or description capable of carrying passengers;
 - (f) The expression "tonnage" means the gross tonnage according to the measurement fixed by the merchant shipping acts of the Parliament of the United Kingdom;
 - (g) The expression "vehicle" means any ferryboat, boat, railway car, cart, wagon, carriage, sleigh, or other conveyance whatsoever, however propelled or drawn.
5. The governor in council may—
 - (a) Appoint one or more persons to carry the provisions of this act into effect;
 - (b) Assign any duty in connection therewith to any officer or person in the employ of the government of Canada;
 - (c) Define and prescribe the duties of such officer or person;
 - (d) Fix the salary or remuneration to be allowed to such officer or person;
 - (e) Engage and pay interpreters skilled in the English and Chinese languages, at salaries aggregating not more than three thousand dollars a year;
 - (f) Make regulations for the carrying out of this act.

6. Every person of Chinese origin, irrespective of allegiance, shall pay into the consolidated revenue fund of Canada, on entering Canada, at the port or place of entry, a tax of one hundred dollars, except the following persons, who shall be exempt from such payment, that is to say:

(a) Members of the diplomatic corps or other Government representatives, their suites and their servants, and consuls and consular agents;

(b) The children born in Canada of parents of Chinese origin and who have left Canada for educational or other purposes, on substantiating their identity to the satisfaction of the controller at the port or place where they seek to enter on their return;

(c) Merchants, their wives and children, the wives and children of clergymen, tourists, men of science, and students, who shall substantiate their status to the satisfaction of the controller, subject to the approval of the minister, or who are bearers of certificates of identity, specifying their occupation and their object in coming into Canada, or other similar documents issued by the Government or by a recognized official or representative of the Government whose subjects they are.

(2) Every such certificate or other document shall be in the English or French language, and shall be examined and indorsed (*visé*) by a British consul or chargé d'affaires or other accredited representative of Her Majesty at the place where it is granted or at the port or place of departure.

(3) Persons of Chinese origin claiming on their arrival to be students, but who are unable to produce the requisite certificate as hereinbefore provided for, shall be entitled to a refund of the tax exacted from them on the production, within eighteen months from the date of their arrival in Canada, of certificates from teachers in any school or college in Canada showing that they are and have been for at least one year bona fide students in attendance at such school or college.

(4) Any woman of Chinese origin who is the wife of a person who is not of Chinese origin shall for the purpose of this act be deemed to be of the same nationality as her husband, and the children of the said wife and husband shall be deemed to be of the same nationality as the father.

(5) Nothing in this act shall be construed as embracing within the meaning of the word "merchant" any merchant's clerk or other employee, mechanic, huckster, pedlar, or person engaged in taking, drying, or otherwise preserving fish for home consumption or exportation.

7. No vessel carrying Chinese immigrants to any port in Canada shall carry more than one such immigrant for every fifty tons of tonnage; and the owner of any such vessel who carries any number in excess of the number allowed by this section shall incur a penalty of two hundred dollars for each Chinese immigrant so carried in excess of such number.

(2) No Chinese immigrant shall be allowed to land in or enter Canada coastwise or overland arriving in transit from any port or place in America from any vessel entering at such port or place, in excess of the number which would have been allowed to land from such vessel had it come direct to Canada.

8. No master of any vessel carrying Chinese immigrants shall land any person of Chinese origin, or permit any to land from such vessel, until a permit so to do, stating that the provisions of this act have been complied with, has been granted to the master of such vessel by the controller; and every master of a vessel who violates the provisions of this section shall incur a penalty of two hundred dollars.

(2) The landing of a person of Chinese origin from a vessel, wherever referred to in this act, shall not be held to apply to the landing of such person on the wharf and the placing of him in a proper building where he may remain until the provisions of this act have been complied with and the controller has given his authority for his departure therefrom; and such person, while in such building, shall for the purpose of this act be held to be still on board the vessel by which he arrived. This provision, however, shall not allow the placing of such person in such building until all quarantine requirements have been complied with.

9. No controller at any port shall grant a permit allowing Chinese immigrants to land until the quarantine officer has granted a bill of health and has certified, after due examination, that no leprosy or infectious, contagious, loathsome, or dangerous disease exists on board such vessel; and no permit to land shall be granted to any Chinese immigrant who is suffering from leprosy or from any infectious, contagious, loathsome, or dangerous diseases.

10. Every conductor or other person in charge of any railway train or car bringing Chinese immigrants into Canada shall be personally liable to Her Majesty for the payment of the tax imposed by section 6 of this act in respect of any immigrant brought by or on such railway train or car, and shall deliver, immediately on his arrival, to the controller or other proper officer at the port or place of arrival, a report in the same terms as is required to be made by section 15 of this act, by the master of a vessel, of all persons of Chinese origin arriving by or being on board of the railway train or car of which he is in charge, and shall, unless such persons are in transit through Canada, pay or cause to be paid to the controller the total amount

of the tax payable by Chinese immigrants so arriving by such railway train or car, and he shall not allow any such immigrants to disembark from such train or car until after such report has been made and such tax has been paid.

11. Every Chinese immigrant who enters Canada otherwise than by disembarking from any vessel or vehicle shall forthwith make a statement and declaration of his entry to the controller or other proper officer at the nearest or most convenient port or place, and shall forthwith pay to such controller or officer the tax of one hundred dollars imposed by this act; and if the statement and declaration is made to an officer other than a controller authorized to keep a register, such officer shall report the fact and transmit the tax to the chief controller or to the nearest controller so authorized, and the controller shall make a record thereof in his register and issue the proper certificate of such registration in conformity with the provisions of section 13 of this act.

12. No controller or other officer charged with the duty of assisting in carrying the provisions of this act into effect shall grant a permit allowing to land from any vessel, nor shall any conductor or other person in charge of any vehicle bring into Canada, either as an immigrant or as an exempt, or as in transit, any person of Chinese origin who is—

- (a) a pauper or likely to become a public charge;
- (b) an idiot or insane;
- (c) suffering from any loathsome, infectious, or contagious disease;
- (d) a prostitute or living on the prostitution of others.

(2) All such persons are prohibited from entering Canada; and if they enter they shall be liable to imprisonment for a term not exceeding six months, and shall in addition be liable to deportation, and the master, conductor, or other person who knowingly lands or brings or assists or permits to land in Canada any such persons of Chinese origin shall also be liable to a penalty not exceeding two hundred dollars or to imprisonment for a term not exceeding six months.

13. The controller shall deliver to each Chinese immigrant who has been permitted to land or enter, and in respect of whom the tax has been paid as hereinbefore provided, a certificate containing a description of such individual, the date of his arrival, the name of the port of his landing and an acknowledgment that the duty has been duly paid; and such certificate shall be prima facie evidence that the person presenting it has complied with the requirements of this act; but such certificate may be contested by Her Majesty, or by any officer charged with the duty of carrying this act into effect, if there is reason to doubt the validity or authenticity thereof, or of any statement therein contained; and such contestation shall be heard and determined in a summary manner by any judge of a superior court of any province of Canada where such certificate is produced.

14. The chief controller, and such controllers as are by him authorized so to do, shall each keep a register of all persons to whom certificates of entry have been granted.

15. Every master of any vessel bringing Chinese immigrants to any port or place in Canada shall be personally liable to Her Majesty for the payment of the tax imposed by this act in respect of any such immigrant carried by such vessel, and shall deliver, together with the total amount of such tax, to the controller, immediately on his arrival in port and before any of his Chinese crew or passengers disembark, a complete and accurate list of his crew and such passengers, showing their names in full, the country and place of their birth, and the occupation and last place of domicile of each of such immigrant passengers.

16. Every master or conductor of any vessel or vehicle who lands or allows to be landed off or from any vessel or vehicle any Chinese immigrant before the tax payable under this act has been duly paid, or who wilfully makes any false statement respecting the number of persons on board his vessel or vehicle, shall, in addition to the amount of the tax payable under the foregoing provisions of this act, be liable to a penalty not exceeding one thousand dollars and not less than five hundred dollars for every such offence, and in default of payment to imprisonment for a term not exceeding twelve months; and such vessel or vehicle shall be forfeited to Her Majesty, and shall be seized by an officer charged with the duty of carrying this act into effect, and dealt with accordingly.

17. Persons of Chinese origin may pass through Canada by railway, in transit, from one port or place out of Canada to another port or place out of Canada without payment of the tax provided for by section 6 of this act, provided that such passage is made in accordance with and under such regulations as are made for the purpose; and any railway company which undertakes to transport such persons through Canada and fails to comply with such regulations or to take such persons out of Canada at the designated port of exit within a period to be fixed by the chief controller shall be subjected to a penalty equal to double the total amount of the tax payable under the provisions of section 6 of this act.

18. Every person of Chinese origin who wishes to leave Canada, with the declared

intention of returning thereto, shall give written notice of such intention to the controller at the port or place whence he purposes to sail or depart, in which notice shall be stated the foreign port or place which such person wishes to visit, and the route he intends taking both going and returning, and such notice shall be accompanied by a fee of one dollar; and the controller shall thereupon enter in a register to be kept for the purpose the name, residence, occupation, and description of the said person, and such other information regarding him as is deemed necessary, under such regulations as are made for the purpose.

(2) The person so registered shall be entitled on his return, if within twelve months of such registration, and on proof of his identity to the satisfaction of the controller (as to which the decision of the controller shall be final), to free entry as an exempt or to receive from the controller the amount of the tax, if any, paid by him on his return; but if he does not return to Canada within twelve months from the date of such registration, he shall, if returning after that date, be subject to the tax payable under the provisions of section 6 of this act in the same manner as in the case of a first arrival.

19. Every person of Chinese origin who wilfully evades or attempts to evade any of the provisions of this act as respects the payment of the tax by personating any other individual, or who wilfully makes use of any forged or fraudulent certificate to evade the provisions of this act, and every person who wilfully aids or abets any such person of Chinese origin in any evasion or attempt at evasion of any of the provisions of this act, is guilty of an indictable offence, and liable to imprisonment for a term not exceeding twelve months, or to a fine not exceeding five hundred dollars, or to both.

20. Every person who takes part in the organization of any sort of court or tribunal composed of Chinese persons for the hearing and determination of any offence committed by a Chinese person, or in carrying on any such organization, or who takes part in any of its proceedings, or who gives evidence before any such court or tribunal, or assists in carrying into effect any decision, decree, or order of any such court or tribunal, is guilty of an indictable offence and liable to imprisonment for any term not exceeding twelve months, or to a fine not exceeding five hundred dollars, or to both; but nothing in this section shall be construed to prevent Chinese persons from submitting any differences or disputes to arbitration, provided such submission is not contrary to the laws in force in the Province in which such submission is made.

21. Every person who molests, persecutes, or hinders any officer or person appointed to carry the provisions of this act into effect is guilty of an indictable offence, and liable to imprisonment for a term not exceeding twelve months, or to a fine not exceeding five hundred dollars, or to both.

22. Every person who violates any provision of this act for which no special punishment is herein provided is guilty of an indictable offence, and liable to a fine not exceeding five hundred dollars, or to imprisonment for a term not exceeding twelve months.

23. All suits or actions for the recovery of taxes or penalties under this act, and all prosecutions for contraventions of this act which are not herein declared to be indictable offences, shall be tried before one or more justices of the peace, or before the recorder, police magistrate, or stipendiary magistrate having jurisdiction, where the cause of action arose or where the offence was committed.

24. All taxes, pecuniary penalties, and revenues from other sources under this act shall be paid into and form part of the consolidated revenue fund of Canada; but one-fourth part of the net proceeds of all such taxes paid by Chinese immigrants shall, at the end of every fiscal year, be paid out of such fund to the Province wherein they were collected.

25. The governor in council may make such regulations as are necessary to prohibit the entry into Canada of any greater number of persons from any foreign country than the laws of such country permit to emigrate to Canada.

DISABILITIES IMPOSED UPON CHINESE AND JAPANESE PERSONS ON PUBLIC WORKS BY BRITISH COLUMBIA, 1898.

The Province of British Columbia prohibits the employment of Japanese or Chinese persons, either directly or by subcontractors, by any person or corporation to whom any franchise has been granted for the right of erecting a bridge, making a railway, tramway, turnpike road, telegraph or telephone line, the construction or improvement of a harbor, lock, dam, slide, or other like work, the right of ferry, the right of carrying on any trade, business, occupation, or calling, or giving, granting, or offering to such person or body corporate any property rights or privileges whatsoever. The penalty upon conviction before any two justices of the peace or like authority is a penalty not exceeding \$25 or less than \$10 for every Chinese or Japanese person employed, whether employed directly or by subcontractors.

VICTORIA.

An act of the legislature of Victoria in 1890 was passed, preceded by a preamble, stating that at a meeting of representatives of Australasian governments, held at Sidney in 1888, it was resolved that it was desirable that the laws of the various Australasian colonies for the restriction of Chinese immigration should be assimilated on a basis approved at that meeting, and the act proceeds to enact restriction of Chinese to 1 for every 500 tons; penalty, £500 upon the master for every Chinaman in excess of the number, requiring the master to muster the Chinese before an officer, providing a penalty of £5 to £20 in addition to the head tax upon Chinamen who land without permit, providing against transshipping, giving the governor in council power to make regulations and rendering the vessels liable to seizure for penalties. Chinese residents are prohibited, notwithstanding they hold a miner's license or business license, from voting in any election whatever, unless they are naturalized subjects of the British Empire. The names of all Chinese who had hitherto been voters were stricken from the list.

QUEENSLAND.

The colony of Queensland in 1877, by act of the colonial parliament, imposed a head tax of £10 for every Chinese person entering the colony, the same to be paid by the master of the vessel before landing. Penalty for neglect was fixed at £20 for each Chinese person so landed or permitted to land, in addition to the amount of the head tax, and the vessel should be forfeited and seized and condemned. Chinamen admitted were to be provided with a certificate. Chinamen entering or attempting to enter the colony without paying the head tax were liable to a penalty not exceeding £10. The act applied also to any Chinaman who was one of the crew of any vessel.

By amendment adopted in 1884 the head tax on Chinamen was increased from £10 to £30, and the penalties for violation were increased. Ships were prohibited from importing a greater number of passengers than in the proportion of 1 to every 50 tons of the tonnage, the penalty for violation being £30 or less for each Chinese passenger so carried in excess.

In 1890 the colony adopted a further act for the restriction of Chinese immigration. This act specially exempted persons duly credited as the representatives of any government, persons born in Queensland, and persons temporarily exempted, such exemptions to be declared by proclamation of the governor in council. By this act no ship shall enter any port or place in the colony having on board a greater number of Chinese passengers than in the proportion of 1 Chinese passenger to every 500 tons of the tonnage of such ship. The master of the ship is required to deliver to the collector the number and names of all Chinese on board the ship, including the crew of the ship. Furthermore, he must muster before the collector or any police officer the whole of the Chinese crew and passengers. The penalty imposed upon Chinamen for unauthorized landing is £50. In default of payment, imprisonment at hard labor from three to six months.

NEW SOUTH WALES.

The legislation of New South Wales relative to Chinese immigration dates from 1881. In that year was enacted a law "to restrict influx of Chinese into New South Wales." This provides that any vessels having on board a greater number of Chinese than in the proportion of one Chinese to every 100 tons of the tonnage shall be liable to a penalty of £100 for each Chinaman carried in excess.

Section 4 provides that the Chinese permitted to land from each vessel shall pay a head tax of £10, to be advanced by the master of the vessel. The same head tax is required by Chinese arriving otherwise than by sea. The penalty on the Chinamen for evasion is £10 in addition to the head tax, and in default thereof imprisonment for twelve months, unless the penalty is sooner paid.

The act of 1881 was repealed in 1888, and the substitute is entitled "An act to provide for the protection of the colony from the disturbances and national dangers of Chinese immigration." It provides especially for the regulation of the Chinese at present resident in the colony, and to indemnify the government for all acts done by the executive or ministerial authority in relation to Chinese immigrants or vessels carrying such immigrants, etc. In this act the number of Chinese is limited to one for every 300 tons of the vessel's tonnage; the head tax is increased to £100; the penalty upon the master of the vessel for violation of the law is £500 for each Chinese landed or suffered to land or escape. Chinamen in the colony not having paid the tax are liable to a penalty of £50, in addition to the head tax, or imprisonment for two years unless the penalty be sooner paid.

No Chinaman is permitted to engage in the work of any gold, silver, or any mine,

or any mining pursuit whatever without express authority under the hand and seal of the minister in charge of mines. Chinese who are British subjects are exempted, and regulations for the enforcement of the law are provided.

In 1896 the Chinese restriction act of 1888 is extended so as to apply to "all persons belonging to any colored race inhabiting the continent of Asia or the continent of Africa, or any island adjacent thereto, or any island in the Pacific or Indian oceans," except representatives of foreign Governments.

The act of 1888 is amended by repealing the exception in favor of Chinese by birth a British subject, and therefore, since 1896, not even Chinamen subject to Great Britain can be admitted to the colony unless paying the tax of £100. The law does not apply to ministers of religion, missionaries, native teachers, tourists, merchants, men of science, or students, and the wives and families of such persons, and also their domestic servants, provided they carry a certificate of identification from the British consul at the port of departure.

TASMANIA.

The colony of Tasmania in 1887 limited the number of Chinese to be brought by any vessel to one for every 100 tons of the tonnage. It imposed a penalty of £10 upon the master for each Chinese in excess of the limitation and a head tax of £10 for every Chinese landed. Penalty and exemption similar to those in the other Australasian colonies.

WESTERN AUSTRALIA.

In 1897 the colony of West Australia adopted a stringent law applicable to laborers immigrating from India, China, Africa, or the islands of the Indian and Pacific oceans, or of the Malayan archipelago. The leading features of this act are the restriction of the number of immigrants who may be permitted to land to one for every 500 tons of the tonnage of the vessel. The penalty imposed upon the master or owner for the violation is £100 for each laborer so landing. No laborers of these restricted classes can be imported unless a contract shall have been previously entered into. "Every person who shall cause a laborer to be brought or imported into the colony contrary to this provision of this act shall be liable to a penalty not exceeding £100 for every laborer so brought or imported." A contract is entered into before the British or colonial authority, and is recorded in proper form. A runaway laborer who attempts to violate the contract shall be arrested, if found, without any other warrant than the act, by any member of the police force, and detained in custody until he is returned to the port or place from which he is shipped, or is otherwise dealt with at the expense of the employer. The employer is also required, under penalty not exceeding £25, to notify a magistrate or police constable of the desertion of any laborer from his employment or disappearance therefrom for a period of three days. The contract for service to which these penalties and provisions apply shall not exceed three years in duration, but may be renewed or may be rescinded by mutual agreement, in which case the employer is required to pay the expenses of the laborer back to the country from which he came.

NEW ZEALAND.

The colony of New Zealand in 1881 limited the number of Chinese to one for every 10 tons of the tonnage of the vessels, and imposed a penalty of £10 for each Chinese in excess. It required a head tax of £10 for all Chinese landed, and imposed penalties, provided for summary jurisdiction by justices of the peace, and provided for certificates similar to those provided by the laws of the other colonies.

IMMIGRATION RESTRICTION ACT, NATAL, 1897.

The immigration restriction act of Natal of 1897 has served as a model for later legislation in New Zealand and New South Wales. The principal sections of this act are as follows:

The immigration into Natal, by land or sea, of any person of any of the classes defined in the following subsections, hereinafter called "prohibited immigrant," is prohibited, namely:

- (a) Any person who, when asked to do so by an officer appointed under this act, shall fail to himself write out and sign, in the characters of any language of Europe, an application to the colonial secretary in the form set out in Schedule B of this act.
- (b) Any person being a pauper, or likely to become a public charge.
- (c) Any idiot or insane person.
- (d) Any person suffering from a loathsome or a dangerous contagious disease.

(e) Any person who, not having received a free pardon, has within 2 years been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, and not being a mere political offense.

(f) Any prostitute, and any person living on the prostitution of others.

4. Any prohibited immigrant making his way into, or being found within, Natal in disregard of the provisions of this act shall be deemed to have contravened this act, and shall be liable, in addition to any other penalty, to be removed from the colony, and upon conviction may be sentenced to imprisonment not exceeding 6 months without hard labor, provided that such imprisonment shall cease for the purpose of deportation of the offender, or if he shall find two approved sureties, each in the sum of £50, that he will leave the colony within 1 month.

5. Any person appearing to be a prohibited immigrant within the meaning of section 3 of this act and not coming within the meaning of any of the subsections (c), (d), (e), (f) of the said section 3 shall be allowed to enter Natal upon the following conditions:

(a) He shall, before landing, deposit with an officer appointed under this act the sum of £100.

(b) If such person shall, within 1 week after entering Natal, obtain from the colonial secretary or a magistrate a certificate that he does not come within the prohibition of this act, the deposit of £100 shall be returned.

(c) If such person shall fail to obtain such certificate within 4 weeks, the deposit of £100 may be forfeited and he may be treated as a prohibited immigrant, provided that in the case of any person entering Natal under this section no liability shall attach to the vessel or to the owners of the vessel in which he may have arrived at any port of the colony.

6. Any person who shall satisfy an officer appointed under this act that he has been formerly domiciled in Natal and that he does not come within the meaning of any of the subsections (c), (d), (e), (f) of section 3 of this act shall not be regarded as a prohibited immigrant.

7. The wife and any minor child of a person not being a prohibited immigrant shall be free from any prohibition imposed by this act.

8. The master and owners of any vessel from which any prohibited immigrant may be landed shall be jointly and severally liable to a penalty of not less than £100, and such penalty may be increased up to £5,000 by sums of £100 each for every 5 prohibited immigrants after the first 5, and the vessel may be made executable by a decree of the supreme court in satisfaction of any such penalty, and the vessel may be refused a clearance outward until such penalty has been paid and until provision has been made by the master to the satisfaction of an officer appointed under this act for the conveyance out of the colony of each prohibited immigrant who may have been so landed.

9. A prohibited immigrant shall not be entitled to a license to carry on any trade or calling, nor shall he be entitled to acquire land in leasehold, freehold, or otherwise, or to exercise the franchise, or to be enrolled as a burgess of any borough or on the roll of any township; and any license or franchise right which may have been acquired in contravention of this act shall be void.

10. Any officer thereto authorized by Government may make a contract with the master, owners, or agent of any vessel for the conveyance of any prohibited immigrant found in Natal to a port in or near such immigrant's country of birth, and any such immigrant with his personal effects may be placed by a police officer on board such vessel, and shall in such case, if destitute, be supplied with a sufficient sum of money to enable him to live for 1 month according to his circumstances in life after disembarking from such vessel.

11. Any person who shall in any way willfully assist any prohibited immigrant to contravene the provisions of this act shall be deemed to have contravened this act.

12. Any person who shall willfully assist the entry into Natal of any prohibited immigrant of the class (f) in section 3 of this act shall be deemed to have contravened this act, and shall upon conviction be liable to be imprisoned with hard labor for any period not exceeding 12 months.

13. Any person who shall be willfully instrumental in bringing into Natal an idiot or insane person without a written or printed authority, signed by the colonial secretary, shall be deemed to have contravened this act, and, in addition to any other penalty, shall be liable for the cost of the maintenance of such idiot or insane person whilst in the colony.

14. Any police officer or other officer appointed therefor under this act may, subject to the provisions of section 5, prevent any prohibited immigrant from entering Natal by land or sea.

15. The governor may from time to time appoint, and at pleasure remove, officers for the purpose of carrying out the provisions of this act, and may define the duties of such officers, and such officers shall carry out the instructions from time to time given to them by the ministerial head of their department.

16. The governor in council may from time to time make, amend, and repeal rules and regulations for the better carrying out of the provisions of this act.

17. The penalty for any contravention of this act, or of any rule or regulation passed thereunder, where no higher penalty is expressly imposed, shall not exceed a fine of £50, or imprisonment, with or without hard labor, until payment of such fine or in addition to such fine, but not exceeding in any case 3 months.

18. All contraventions of this act or of rules or regulations thereunder and suits for penalties or other moneys not exceeding £100 shall be cognizable by magistrates.

CANADIAN CONTRACT-LABOR LAW OF 1897.

Recommendation for the amendment of the contract-labor law of the United States will be aided by a comparison with the recent legislation of Canada, the only country that has followed the example of the United States in this phase of legislation. The Canadian act of 1897 is not a general act, but is merely in the nature of a retaliatory enactment directed against the United States. An act of 1886 made special provision encouraging the assistance of immigrants as laborers by providing that any moneys advanced to them should be recovered according to the terms of the contract after landing in Canada, and also that "every immigrant who in consideration of money advanced as for said engagements binds himself to enter the service of any employer in Canada on his arrival there in any capacity, and to work for and serve such employer in such capacity during any certain time not exceeding six months and at any named rate of wages, and afterwards refuses and neglects on his arrival in Canada to perform such engagement, shall be liable on summary conviction to a penalty not exceeding \$20 and costs, and to imprisonment until such penalty and costs are paid." This law continued in force until 1897, when a statute modeled somewhat after the alien contract labor law of the United States was enacted applicable solely to immigration from the United States under the interpretation of the final clause, as will be seen below. This was amended in 1898 and in 1900, and, together with its amendments, is described as follows by the Canadian Labor Gazette:

The act as originally in force made it unlawful for any person, partner, or corporation in any way to prepay the transportation or in any way to assist or encourage the importation or immigration of any alien or foreigner into Canada, under contract or agreement, parole or special, express or implied, made previous to the importation or immigration of such alien or foreigner, to perform labor or services of any kind in Canada. It was provided, however, that nothing in the act should be so construed as to prevent any citizen or subject of any foreign country temporarily residing in Canada, either in a private or official capacity, from engaging under contract or otherwise persons not residents or citizens of Canada to act as private secretaries or domestics, nor any person, partnership, or corporation from engaging under contract or agreement skilled workmen in foreign countries to perform labor in Canada in or upon any new industry not yet established in Canada, provided that skilled labor for that purpose could not be otherwise obtained. Nor were the provisions of the act to apply to professional actors, artists, lecturers, or singers, or to persons employed strictly as personal or domestic servants. It was also provided that nothing in the act should be construed as prohibiting any person from assisting any member of his family, or any relative or personal friend, to migrate from any foreign country to Canada for the purpose of settling here.

These sections of the act have been allowed to remain as they were, with the exception of that part of the provision which states that the act shall not be construed as "prohibiting any person from assisting any member of his family, or any relative or personal friend, to migrate to Canada for the purpose of settlement here." It was contended that the words "or personal friend" gave unwarranted latitude to persons who might seek to evade the provisions of the act, and for this reason the house in its amendment caused these words to be struck out, thereby restricting the exemptions under this heading to members of the family or relatives.

A very important addition, however, as to what constituted a violation of the act was made in section 8 of the amendment, whereby the promise of employment through advertisements, printed or published in any foreign country to which the act applied, would be regarded as a violation. The exact wording of this section is as follows:

"8. It shall be deemed a violation of this act for any person, partnership, company, or corporation to assist or encourage the importation or immigration of any person who resides in, or is a citizen of, any foreign country to which this act applies, by promise of employment through advertisements printed or published in such foreign country; and any such person coming to this country in consequence of such an advertisement shall be treated as coming under a contract as contemplated by this act, and the penalties by this act imposed shall be applicable in such case: *Provided*, That this section shall not apply to skilled labor not obtainable in Canada, as provided by section 5 of this act."

The original act provided that all contracts or agreements made in violation of the terms of the act should be void and of no effect. This section of the original act has been allowed to remain as it was.

Important changes have been made in the amendment to secure more effective means of enforcing the act in cases of violation. As the act originally stood, the person or company, etc., found guilty of a violation of the act was liable to a penalty of \$1,000, and the mode of recovery of this penalty was that the same should be sued for and recovered by the attorney-general of Canada or a person duly authorized thereto by him, but the latter might pay the informer who had furnished the original information that the law had been violated such a share of the penalties recovered as he might deem reasonable and just, not exceeding 50 per cent, where it appeared that the recovery was had in consequence of the information thus furnished; but it was also expressly provided that no proceedings under the act or prosecutions for violations of it could be instituted without the consent of the attorney-general of the Dominion or some person duly authorized by him.

It was contended by those who sought an amendment of these provisions that there were two important obstacles to an effective enforcement of the act under the method of procedure and penalty as set forth. It was maintained that the necessity of obtaining the consent of the attorney-general of Canada for the institution of proceedings was a requirement which made it difficult for parties who believed themselves to be suffering in consequence of a violation of the act from finding the immediate means of redress. The penalty being fixed at \$1,000 also had, it was alleged, the tendency to make the courts more conservative in enforcing the provisions of the act, and it was further believed that many cases might arise in which a light penalty would be quite sufficient.

To remove these objections important provisions were made in this session's amendment. The penalty has been changed from one of \$1,000 to a penalty not exceeding \$1,000 nor less than \$50. The mode of recovery of this sum has been greatly simplified. A person may, with the written consent of the judge of the court in which the action is intended to be brought, sue for and recover the amount as a debt in any court of competent jurisdiction in which debts of like amount are now recovered.

This sum may also, with the written consent, to be obtained ex parte, of the attorney-general of the Province in which the prosecution is had, or of a judge of a superior or county court (the section of the old act requiring the consent of the attorney-general of Canada is repealed), be recovered under summary conviction before any judge of a county court (being a justice of the peace) or a magistrate, or stipendiary magistrate, or any functionary, tribunal, or person invested, by the proper legislative authority, with power to do alone such acts as are usually required to be done by two or more justices of the peace, and acting within the local limits of his or its jurisdiction. In these cases the sum recovered shall be paid to the minister of finance and receiver-general.

Thus two methods are provided for the recovery of the penalty. By one it is recovered as a debt to be sued for by any person who first brings an action therefor in a court of competent jurisdiction in the manner provided for; by the other it is recovered on summary conviction before any person or tribunal invested with power to do alone such acts as are usually required to be done by two or more justices of the peace. The receiver-general may in cases where action is brought for the recovery of a penalty, in accordance with these methods, pay, as under the old act, to any informer who furnishes the original information that the law has been violated such share of the penalty as he deems reasonable and just, not to exceed 50 per cent, where it appears that the recovery was consequent upon the information furnished by him.

Separate proceedings may, under this amendment, as in the original act, be instituted for each alien or foreigner who is a party to such contract or agreement.

The provision in the old act making guilty of an indictable offense the master of any vessel who knowingly brings into Canada on such vessel and lands or permits to be landed from any foreign port or place any alien laborer, mechanic, or artisan who, previous to embarkation on such vessel, had entered into contract or agreement, parole or special, express or implied, to perform labor or service in Canada remains as it was. The fine for an offense under this section is not more than \$500 for each alien laborer, mechanic, or artisan so brought or landed, or imprisonment for a term not exceeding 6 months.

Section 6 of the original act provided that the attorney-general of Canada, in cases where he was satisfied that an immigrant has been allowed to land in Canada contrary to the provisions of the act, might cause such immigrant, within the period of one year after landing or entry, to be taken into custody and returned to the country whence he came at the expense of the owner of the vessel. This part of section 6 remains as it was, but an additional clause, which provides that if such person enters from an adjoining country he may be returned at the expense of the person previously contracting for his services, has been amended so as to read "at the expense

16. The governor in council may from time to time make, amend, and repeal rules and regulations for the better carrying out of the provisions of this act.

17. The penalty for any contravention of this act, or of any rule or regulation passed thereunder, where no higher penalty is expressly imposed, shall not exceed a fine of £50, or imprisonment, with or without hard labor, until payment of such fine or in addition to such fine, but not exceeding in any case 3 months.

18. All contraventions of this act or of rules or regulations thereunder and suits for penalties or other moneys not exceeding £100 shall be cognizable by magistrates.

CANADIAN CONTRACT-LABOR LAW OF 1897.

Recommendation for the amendment of the contract-labor law of the United States will be aided by a comparison with the recent legislation of Canada, the only country that has followed the example of the United States in this phase of legislation. The Canadian act of 1897 is not a general act, but is merely in the nature of a retaliatory enactment directed against the United States. An act of 1886 made special provision encouraging the assistance of immigrants as laborers by providing that any moneys advanced to them should be recovered according to the terms of the contract after landing in Canada, and also that "every immigrant who in consideration of money advanced as for said engagements binds himself to enter the service of any employer in Canada on his arrival there in any capacity, and to work for and serve such employer in such capacity during any certain time not exceeding six months and at any named rate of wages, and afterwards refuses and neglects on his arrival in Canada to perform such engagement, shall be liable on summary conviction to a penalty not exceeding \$20 and costs, and to imprisonment until such penalty and costs are paid." This law continued in force until 1897, when a statute modeled somewhat after the alien contract labor law of the United States was enacted applicable solely to immigration from the United States under the interpretation of the final clause, as will be seen below. This was amended in 1898 and in 1900, and, together with its amendments, is described as follows by the Canadian Labor Gazette:

The act as originally in force made it unlawful for any person, partner, or corporation in any way to prepay the transportation or in any way to assist or encourage the importation or immigration of any alien or foreigner into Canada, under contract or agreement, parole or special, express or implied, made previous to the importation or immigration of such alien or foreigner, to perform labor or services of any kind in Canada. It was provided, however, that nothing in the act should be so construed as to prevent any citizen or subject of any foreign country temporarily residing in Canada, either in a private or official capacity, from engaging under contract or otherwise persons not residents or citizens of Canada to act as private secretaries or domestics, nor any person, partnership, or corporation from engaging under contract or agreement skilled workmen in foreign countries to perform labor in Canada in or upon any new industry not yet established in Canada, provided that skilled labor for that purpose could not be otherwise obtained. Nor were the provisions of the act to apply to professional actors, artists, lecturers, or singers, or to persons employed strictly as personal or domestic servants. It was also provided that nothing in the act should be construed as prohibiting any person from assisting any member of his family, or any relative or personal friend, to migrate from any foreign country to Canada for the purpose of settling here.

These sections of the act have been allowed to remain as they were, with the exception of that part of the provision which states that the act shall not be construed as "prohibiting any person from assisting any member of his family, or any relative or personal friend, to migrate to Canada for the purpose of settlement here." It was contended that the words "or personal friend" gave unwarranted latitude to persons who might seek to evade the provisions of the act, and for this reason the house in its amendment caused these words to be struck out, thereby restricting the exemptions under this heading to members of the family or relatives.

A very important addition, however, as to what constituted a violation of the act was made in section 8 of the amendment, whereby the promise of employment through advertisements, printed or published in any foreign country to which the act applied, would be regarded as a violation. The exact wording of this section is as follows:

"8. It shall be deemed a violation of this act for any person, partnership, company, or corporation to assist or encourage the importation or immigration of any person who resides in, or is a citizen of, any foreign country to which this act applies, by promise of employment through advertisements printed or published in such foreign country; and any such person coming to this country in consequence of such an advertisement shall be treated as coming under a contract as contemplated by this act, and the penalties by this act imposed shall be applicable in such case: *Provided*, That this section shall not apply to skilled labor not obtainable in Canada, as provided by section 5 of this act."

or personal friend, to migrate from any foreign country to Canada for the purpose of settlement here.

6. The attorney-general of Canada, in case he shall be satisfied that an immigrant has been allowed to land in Canada contrary to the prohibition of this act, may cause such immigrant, within the period of one year after landing or entry, to be taken into custody and returned to the country whence he came, at the expense of the owner of the importing vessel, or, if he entered from the adjoining country, at the expense of the person previously contracting for the services.

7. The receiver-general may pay to any informer who furnishes original information that the law has been violated such a share of the penalties recovered as he deems reasonable and just, not exceeding 50 per cent, where it appears that the recovery was had in consequence of the information thus furnished.

8. No proceedings under this act, or prosecutions for violation thereof, shall be instituted without the consent of the attorney-general of Canada, or some person duly authorized by him.

9. This act shall apply only to such foreign countries as have enacted and retained in force, or as enact and retain in force, laws or ordinances applying to Canada of a character similar to this act.

APPENDIX TO CHAPTER III, PART II.

WAGES OF GARMENT MAKERS IN THE PHILADELPHIA TRADE.

[The following special report, prepared by Miss Helen Marot and Miss Caroline L. Pratt, to accompany the investigation of the clothing trade, was received too late for insertion at the proper place in this volume. It is inserted at this point, and shows especially the influence of country competition upon the wages of garment workers in the city of Philadelphia.]

In general, the same system of manufacture of men's ready-made clothing prevails in Philadelphia as does in Chicago and New York, and in the United States as in England. Ready-made clothing is contracted out and made up in shops of varying sizes, which are classed in the factory inspector's report as "sweat shops."

It is the purpose of this report to deal with wages and other conditions of employment. We shall describe the systems of manufacture and the position of the contractors only so far as these bear upon the former.

In giving the rates of wages paid in Philadelphia to the makers of men's clothing, we present figures which are similar to those of other cities, but the unusual feature of the Philadelphia trade is the effect of the country work (i. e., the manufacture of ready-made clothing in villages and on farms) upon the wages of the town worker, which we undertake to show. As the highest grade of ready-made work is not sent to the country, and as the lower grade is confined to the foreign population in the city, our report deals with this class—that is, the class represented by a \$15 suit at retail and all clothing which sells at a price lower than that.

According to the factory inspector's report of 1900, there are 6,774 men and women employed in Philadelphia in the manufacture of coats, vests, and trousers. This total includes ready-made and custom work and summer clothing. The total is greatly in excess of the actual number employed, as the factory inspectors are required to revisit shops whenever the location is changed, and in this way are apt to duplicate the number of employees. Their total is greatly in excess of our estimate, also, because we have considered separately the ready-made and custom work. It is on this basis that the labor unions are organized, makers of ready-made clothing subdividing their unions into Vest makers, Trousers makers, and Coat makers. The tailors, or makers of custom clothing, unite in one body as Journeymen tailors.

It was as difficult to obtain accurate statements as to numbers engaged in the trade from the union officials as from the inspector's report, as their written records do not extend beyond the members of the union. The walking delegate of the Vest Makers' Union had ground for his estimate as the part of the trade he represents is so closely organized. He had upon his books 500 members, and stated that there were not more than 50 outside of the organization. Our observation bore out this testimony, for out of 112 vest makers whom we interrogated as to whether or not they belonged to the union only 5 replied in the negative, although every effort was made to include both union and nonunion shops. The union estimate for the whole trade for 1900 was 3,650, including cutters, while the inspector's estimate was 6,774, exclusive of cutters. Not accepting the union estimate unqualifiedly, and on the other hand not wholly rejecting the factory inspector's figures, but basing our calculations on both and on our observation, it is safe to say roughly that the makers of men's ready-made clothing in shops number between 4,000 and 5,000 people. We accepted the testimony of 261 of these workers relative to their wages.

Unsatisfactory as the above result is as to numbers, we could secure no figures relating to the number of country workers. The manufacturers of Philadelphia repeatedly asserted that they sent 75 per cent of the work to country contractors. We could obtain no other testimony worth considering. The factory inspector's report does not indicate whether the shops reported in country districts are manufacturing for Philadelphia. We accepted the testimony of 73 of these people working in shops and 38 working in their own homes.

We endeavored to make our cases typical, and rejected such statements as were shown to be influenced by conditions peculiar to the persons interviewed. We gave out no printed forms to be filled in by the workers, but each person was carefully questioned.

Besides individual statements, we secured written statements from 50 city contractors. Many of these we found to be incomplete or false when we attempted deductions as to profits, and therefore were obliged to reject all but 15. These 15 statements cover the wages of 227 employees. We accepted also the testimony from 9 country contractors, 4 of whom "farmed out" their work. In these four shops only the wages of the pressers could be used for a comparison, as the wages for operator, baster, and finisher are represented in the price paid to an individual home worker. The remaining 5 shops, including the pressers in the other 4, represent the wages for 129 employees. As will be found upon reference to our tables, we have kept the contractors' statements separate from those of the individual.

The wages varied greatly in the city shops, while in the country they were so nearly identical for the same class of work that we only obtained repetitions beyond a certain point. For example, there were 27 shops in Egg Harbor, all of which were coat shops, all used the same system, and the wages in each class of workers were about the same. After questioning the workers in four shops and talking to their respective employers, we thought the testimony sufficient upon which to base our statement.

The following tables include the shop workers who were employed in the making of coats, vests, and trousers, as operators, pressers, basters, and finishers.

WAGES OF GARMENT MAKERS.

227		8.37	129		5.35	

It will be necessary to explain the difference in the organization of shops in town and country. The shops which we visited, and which we believe are typical of the country trade, are located at Egg Harbor, New Jersey, and in Montgomery and Bucks counties, Pa., where the bulk of the work is done. There are 27 shops at Egg Harbor, all coat shops and all organized practically the same way. The others in Pennsylvania are all outgrowths of the "farming out" system. These latter are isolated, and therefore the organization is more independent and often not well worked out; or else it corresponds to town work, which influence can be directly traced, either to one or two employees upon whom the contractor depends, and who had learned their trade in town, or to the contractor himself, who had done the same.

The work of the operator is the same in the country and town shops in that it is confined to machine work, though the division of the work is somewhat different. The city coat operators, working piecework, as they do in some shops, have their work arranged for them in "teams," each member of which confines himself to the stitching on a certain part of the garment. This makes a gain in number produced, but each member of the team is more or less limited in what he can do by what the others in his team can accomplish. This latter consideration is one of those upon which the organized coat makers are basing their demand for week work. They explained that, while the piecework offered opportunities for higher wages to the rapid workers, they were hampered by the inability of the less rapid workers in their team. In week work, however, those classed as first operators, according to the number produced, receive this higher wage. The week-work system throws the responsibility of dividing the work so that everyone is kept busy upon the contractors.

The team work is a more serious consideration with the coat makers than with the vest and trousers makers, because a coat admits of so much finer division of labor. While the teams in vests and trousers number never more than 3, and usually only 2, and many shops organized as piecework without teams at all, the coat operators work in teams of never less than 3.

In the country, week work is the rule, but even where piecework is used the objectionable feature of team work has not troubled the workers.

But the most striking difference between the country and town shops is that the operators in the town shops are invariably men and in the country shops they are women. This latter has been made possible by the introduction of steam or electric power to supersede foot power in the country. At Egg Harbor few shops use foot power, and in Montgomery and Bucks counties, where the shops are younger, foot power is not in use at all. The presence of men in the country shops as operators almost always indicates, in the table, a shop run by foot power. The exceptions to this are to be found in the two American coat operators who gave their wages as \$12 per week. These two men were in the same shop, were originally from the city, and the inference was that they furnished, besides their work, the knowledge about the clothing industry necessary to the successful operation of the shop. The shop is organized very much as the city shops are and shows the influence of these two men.

Pressers in the city are exclusively pressers, and the basters, who are usually women, baste. In many of the country shops those who press are the under pressers and basters as well. In these shops when a consignment of goods is ready for shipping all of the men in the shop drop their other work and do the final pressing.

In the country shops all of the "felling" is given to outside women. What finishing must be done during the process of making up the coat is done by the basters and under pressers. All whom we have classified in the country shops as "finishers" are outside workers. In the city shops there are always some women finishers working in the shops. These women do the felling as well as finishing. There are besides many outside finishers who only fell the work as they do in the country.

The "farming-out" system relieves the contractor of all responsibility as to organization. Contractors farm out exclusively or have shops for the better class of work and farm out the cheapest grades. They have a building for handling, storing, and pressing the goods. The coats, vests, and trousers, are distributed about the country among the villagers and farm people and called for later in the week. The worker is expected to finish the garment, except the buttonholes. The pressers retained in the shop are for incidental pressing rather than for pressing the whole garment, except where a different arrangement is made with the workers, and then all of the pressing is done inside.

To understand how and to what extent the country work affects the wages of city garment makers, we must consider, first, wages for the country home workers. The comparison of wages between town and country workers in shops is a fair one, because they are all using the opportunity to make garments as a means of livelihood. On the contrary, the country home workers are usually simply supplementing other earnings. They are farmers' wives and daughters and those of farm laborers. They make clothing in the intervals of housework and farmwork, for most of them help in

the haying and harvesting. To show how little a matter of business it is with these farm people, it is possible to make a comparison of output between workers in a shop and the same contractor's employees outside. The weekly output of trousers made by 22 people working inside was 900, while that of 50 families outside was 500; an average of 40.9 per individual for the former and of 10 for the latter—too great a difference to be accounted for on the ground of advantage of factory methods over home work. Our average number of all garments, including coats, vests, and trousers, for each family per week, based upon the testimony of 38 home workers, is 16.3. That of one of the largest country contractors is 12.7 per week per family. Owing to the fact that none of the contractors whom we interviewed made all 3 garments inside the shop, it is impossible to offset these figures by an average output per individual from any one shop. But taking 1 typical coat and 1 vest and 1 trousers shop and averaging the output, we get 31.7 garments per individual for 1 week.

At the most, then, the output is only one-half of that of shop workers. This shows how infrequently the work is the principal occupation of these women. Yet, owing to the immense number engaged in it, the volume of work assumes very large proportions. Isolated as these people are and remote from the contractor, they must accept his rate of payment offered through the driver who delivers the goods.

Where the shop replaces the farming-out system, the employees are drawn from these same farmers' families, and a low standard of wages, influenced by the home earnings, prevails throughout. One would expect these shop earnings to be greater than the home earnings, first, because the grade of work is higher, and, indeed, the contractor's principal reason for bringing the work into shops is the increasing demand for a higher grade of work, hence his closer supervision; and second, because of the better opportunity which a worker has of making a bargain when associated with other workers, whether or not they are joined together through organization.

While collecting the material from the country home workers we foresaw the desirability of making such a comparison. But the country people were so unused to thinking of their work as a regular employment that their answer as to how many garments they could make in a day, working steadily, were mere guesses, and many of them would make no estimate at all. Four trousers makers answered the question as follows: One, with the help of a daughter, actually made 10 pairs per week, but claimed that she could make 4 pairs per day or 24 pairs per week if she gave all her time. She received on an average per pair 13 cents, which is a cent and a half below our average for country home workers on trousers. This would give her and her daughter together a weekly wage of \$3.12. Two other women, while making but 6 pairs per week, claimed that each could, without help, make 2 pairs per day, or 12 pairs per week. One of them was paid at the rate of 11 cents and the other at the rate of 19 cents, which represent the extremes of rates given us. Thus the one could make per week \$1.32 and the other \$2.38. This statement of rates does not by any means represent the difference in grade of work. The 11 cents shows the extreme to which a contractor may go, if he is so disposed, when dealing with isolated people. The statement which puts the best light upon the wages of the country home worker was from a woman who said that, while she made only 11 pairs per week, she could make, unaided, 4 pairs per day, or 24 pairs per week. She received the best grade given out by her contractor, and was paid 18 cents per pair. This would have given her a wage of \$4.32. We could not use the few answers which were given us by the coat makers; and while the vest makers gave estimates, we found no vest makers working in shops with whom a comparison could be made. However, answers from 8 vest makers show that they could make on an average 34.8 vests per week. The average rate for all is \$0.104, which would give an average weekly wage of \$3.62.

The highest wage paid in the country shops to women is \$9 per week, and the lowest \$2.75, the average being \$5.22. This includes coats and trousers shops both in the farming-out districts and at Egg Harbor. A more helpful comparison, perhaps, would be between the statements of country home workers on trousers given above and the wages paid in a trousers shop in the same district. The women operators in this shop are paid by the piece, and the average is \$5 per week. They are all skilled operators, 9 in number, with slight variation in wages.

Imperfect as is this material regarding the possible wages of home workers, it is safe to draw the conclusion that there is a slight advantage to those who work in the shop.

The country contractors working in shops save in the cost of production over city contractors in the employment of women operators in the place of men. It is difficult, on account of the different division of labor in the country and city shops, to make in this connection a close comparison of wages.

Average city wages:		Average country wages:	
Coat operators, male.....	\$10.72	Coat operators, female	\$5.84
Vest basters, female.....	6.59	Coat basters, male.....	7.79

It will be seen, however, that the women coat operators in the country who get the highest wages paid women receive \$5.34, and that the city women basters on vests are receiving \$6.59. Here we find women in the city engaged in a lower class of work and receiving higher pay than the women in the country who are doing the highest grade of work. If we now take the highest grade of workers among the men, that is, the operators in the city and the basters in the country, we find that the operators in the city receive an advance of nearly \$3 over the country coat basters; but part of the advance must be attributed to the greater skill required in operating.

Reference to the above table will show what would be the effect upon rates of wages if women were to enter into competition with men in the city trade. If the vest basters, with an average wage of \$6.59, should offer their services even at a considerable increase over their present wages as skilled coat operators the rate of wages for operating coats would be reduced.

So far neither the Jewish women in the trade nor the Americans have come into direct competition with men operators, although American girls are operating in some of the shops in connection with wholesale houses, and in the shops which undertake the highest grades of ready-made garments.

It has become possible for women to enter the trade as operators just so far as the shops have adopted steam or electric power, which has been done with a few exceptions in the country. This has taken place to some extent in the city, and yet the largest manufacturer of ready-made clothing in Philadelphia recently advertised for women operators, having opened a shop which the firm expected would form the nucleus of a larger factory to be built later. Although trade was dull, they had almost no answers, and such as they did have were from girls not sufficiently skilled to be acceptable.

The city contractors, through the year, fill in the deficiencies in seasonal orders sent to the country. The average price paid city contractors is slightly higher than the price paid for country work. If we now take the total wages involved in making a garment, rather than the averages paid the different classes of workers, or the total average for the trade, we can make a clearer comparison in the costs of manufacture so far as wages are concerned.

Average cost in wages per garment.

To city contractors:		To country contractors:	
Coats.....	\$0.395	Coats.....	\$0.287
Vests.....	.213	Vests.....	.115
Trousers.....	.207	Trousers.....	.188

The largest item of expense, outside of wages, for the city contractor is his rent, which is offset by the freight charges in the expenses of the country contractor. The few other expenses are easily balanced. It is evident that the lower cost of production caused by lower rates of wages has drawn the bulk of what is known as "seasonal work" to the country, leaving only the "rush-order work" for the city contractor, who is near at hand. The effect of dividing the trade between the country and city has been to reduce the annual income of the city garment maker through shortening the working year rather than by altering the rate of wages. It is this short season and irregularity of employment which is alarming to the city worker. It is doubtful whether it is possible to speak at all of a "season" of work at the present time in Philadelphia. During the winter and summer the work is heavier than in the spring and fall months, but even then it is fitful. Unemployment is not peculiar to the Philadelphia trade, but in other cities there is a defined "slack" and "busy" season, which can with some certainty be counted upon. The table on page 711 shows the actual loss in weekly income through irregularity of employment throughout the year. The average rate of weekly wages for all classes in the city is \$8.50, the average number of weeks is 28, and the average weekly income throughout the year is \$4.41, making a loss of 48 per cent through unemployment.

Contrasting this with the country shop work as given in table on page 711, where the rate of wages is the more serious feature to the employee, the loss in wages through unemployment reaches only a little over 16 per cent. The average wage for all classes, excepting finishers, is \$6.20, the weeks 44, and the average weekly income throughout the year is \$5.18.

The low-water mark which the annual income of the garment makers has reached in town, taken in conjunction with the rates of wages paid in the country, explains why the city contractor can no longer offer competition successfully. In the United States Special Report on the Slum Districts of Great Cities made in 1893 the average rate for all workers in the Philadelphia district was \$8.68. The part of the city reported covered the territory where is found the greatest number of sweat shops,

and from where we drew the bulk of the material here reported. The commissioner's report included men and women engaged in "agriculture," the "fisheries and mining," "professional," "domestic and personal service," "trade and transportation," "manufacture and mechanical industries," "housewives and at work," and "scholars and at work." The same report shows for the same district an average loss in time of 2.9 months. A comparison with the wages and time of the garment workers for this locality shows that the income of these people is already below the average in their own neighborhood.

We have not yet spoken of the lower cost of living in the country, which, of course, is fundamental and can not better be shown than through comparative rentals of the same class of workers. The average rent paid by the city worker is \$8.96 per month, based upon 180 answers to our question. The families average five persons and occupy three rooms. Out of 84 country garment workers 51 own their own homes, and 33 pay an average monthly rent of \$4.59 for a whole house.

The part of the city trade considered here is practically confined to Russian Jews, if we except the cutters and women who "finish" in their homes. The cutters are American and most of the women referred to are Italians. Out of over 100 shops which we visited, we found only 2 owned by Italian contractors. The rest were Jewish. The operators who were working in both of these shops were Italians, the pressers were Jews, and the others were both Jews and Italians.

Of the 261 whom we questioned as to nationality, 237 were Jews, 20 were Italians, and 4 were Americans. Of the 20 Italians, 16 were women finishers. The average number of years these people had lived in the United States, based upon 225 answers, was 9. The lowest time was 1½ years and the highest 30 years. Out of a total of 50 women finishers working in shops, 33 were Jewish, 13 were Italians, and 4 were Americans.

In the country districts of Pennsylvania the garment workers are Americans, some of whom can be further distinguished as "Pennsylvania Dutch." In New Jersey they are Americans and German-Americans. It seems necessary to make this latter distinction as many of them speak German among themselves. Both the Pennsylvania Dutch and these Americans of German parentage are clannish people, but there is no evidence of a lower standard of living than among their American neighbors. In spite of this, it is these people and their American co-workers who are accepting a lower rate of wages than the Jews in the city. In some cases these country people complained bitterly of the wages they received, but we found no such discontent as we did in the city.

It is remarkable in consideration of the foregoing that the influence of the four local Philadelphia unions—the two Coat Makers, Vest Makers, and Pants Makers—has extended so far as it has. They have within the past 2 years shown an increased activity owing to their affiliation with the United Garment Workers of America. The confidence in the label has been of slow growth, because it has not, in theory, appealed to the men as individuals. But a demand for the label has recently come from manufacturers, which has caused a unionizing of shops and increased the membership of the organization. The manufacturers have been forced into this position through what seems to be a growing demand from small towns in Pennsylvania and the West for labeled goods.

Previous to 1900 the coat and trousers makers were hopelessly disorganized. Since then the coat makers have opened an office and are holding regular meetings, and have in some shops effected a change in the system of work. They have not yet, however, been able to increase their rate of wages. The trousers makers have accomplished nothing as a whole, but have prevented in individual shops a reduction in wages. In many of the shops where coats and trousers are made the operators are still obliged to furnish their own sewing machines.

The vest makers, through all discouragements, have held their men together. They have secured steam or electric power in all but a few of the shops, have shortened their day of labor, and are generally maintaining union rates of wages. These rates for vests correspond exactly with the averages obtained in our investigation.

The country shops are also beginning to feel the pressure of the manufacturer, but the workers themselves show little interest in organization. In one section of the country, where a religious sect, the Mennonites, predominate, there is such a strong objection to the union that the contractors have as yet been unable to prevail upon their employees to form one. At Egg Harbor the union has been formed long enough for a few of the workers to realize the value to themselves of organization; that there is a possibility along the line of wages of improving their condition, and that the union need not be entirely for the benefit of the contractor. Although the union is growing, there is little of what is known as labor agitation.

The first consideration of the union in the city has been that of hours. The tend-

ency of the piece-rate system to demoralize hours of labor is as true in the garment trade as in other industries. On the other hand, in week work it is less difficult to maintain a normal working day. It was found that the creation of public sentiment among the workers for shorter hours was a slow process, so that latterly the policy of the unions has been to institute such reforms as would make a long day impossible or unprofitable. The vest makers have made it impossible in the union shops by demanding steam or electric power. Closing off the power at the end of the day prevents operators from working overtime, which in turn ends the day for all others, as they are dependent upon the operator for their supply of work. The coat makers, owing to the greater complexity of a coat, have found it difficult to arrange a piece-rate system which would be applicable to all shops. They are now demanding the week-work system, which besides regulating rates of payment will control the length of the day. The trousers makers have been so far too weak as a body to affect the trade. The piece-rate system, which is universal, is probably due to the will of the contractors rather than to any concerted action of the men themselves.

Although we received unsatisfactory answers to our question as to the length of the day, our figures show in the tables appended that the trousers makers are working on an average 11.5 hours, while the coat and vest makers average only 10. Using the figures relatively, we believe they contain a bit of truth. That is, the trousers makers work longer hours than either of the other two classes.

We have contrasted the systems of city and country work, the rates of wages, and certain influences affecting wages. It remains for us to speak of the most striking contrast between the shops in and outside of the city; the presence of strain in the one and its absence in the other. The difference is not wholly due to the greater intensity of city life, but also to the economic conditions which we have been considering. This strain or intensity which is so marked a feature of the city shop is due to the competition which results from an overfull labor market; to the competition of contractors, who are not only bidding against each other for the rush work, but are constantly striving for the seasonal work, which goes to the country at a lower figure than city wages and rents will permit; and lastly to the piece-rate and "task" systems. These three elements—competition among workers, competition among contractors, and piece-rate and task systems—contribute to a strain which seems to reach the limit of endurance during busy seasons.

There is apparently no dearth of workers in the country, but they are less dependent on their earnings and their expenses are more remote. Nor is there a total lack of competition between country contractors. But that the consignments of goods are larger and much less frequent than those to city contractors, reduces the possibility of bargaining with those who make the consignments, and limits the competition among the country contractors themselves.

The country workers gave us no impression of fighting for the wherewithal to live. It seemed to come with comparative ease and along with it a good time in a mild way. It is hardly necessary to say that the condition and situation of the place of work, which are large factors in the comfort of the employees, add to the balance already placed in favor of the country contractor as an employer. There are no plumbing arrangements, and hence none to get out of order. The pressure of work is never too great to allow for a "cleaning-up" time. There is plenty of space to build in and, therefore, the awful evil of overcrowding is never felt. The shops are usually separated from other buildings, which admits of plenty of fresh air.

HELEN MAROT.
CAROLINE L. PRATT.

PHILADELPHIA, *September 1, 1901.*

PART IV.

CHINESE AND JAPANESE LABOR IN THE MOUNTAIN AND PACIFIC STATES.

PREPARED UNDER THE DIRECTION OF THE INDUSTRIAL
COMMISSION

BY

THOMAS F. TURNER.

ALIEN LABOR IN MOUNTAIN AND PACIFIC STATES.¹

INTRODUCTION.

The problem of Asiatic competition is one in which the people of the East have felt but little interest. It has been a matter of popular belief that Chinese and Japanese competition affected only the laboring classes of the Pacific coast. The error of this will, I think, conclusively appear from an examination of the data herewith submitted. Every Asiatic who finds employment in the United States, whether on the Pacific or Atlantic coast, displaces an American laborer; and while the baneful influence of coolie competition is more noticeable upon our Western coast, it is certain to have its effect upon the labor of the entire nation.

The Chinese colony in the city of San Francisco is a perfect beehive of busy industry. The problem of cheap living has been solved by this peculiar race. Among the lower and common laboring classes, such as are engaged in agricultural pursuits, the cost of living has been reduced to the minimum and the wages paid are much less than any white laborer can live upon. The Chinese coolie and common laborer seems from instinct to be able to adapt himself to conditions under which no white laborer can live. In many instances, especially in agricultural pursuits, coolie labor has absolutely displaced white labor in the Pacific coast States. Hundreds of factories and workshops in the city of San Francisco are in full operation, employing thousands of Chinese operatives, who are manufacturing boots and shoes, brooms, men's clothing, shirts, shirt waists, ladies' skirts, and, indeed, garments of all kinds, that find their way not only into Western but Eastern markets as well, displacing in many instances the products of our Eastern workshops and factories. So that, as stated, this question is not one which interests the Pacific States alone, but which is of vital concern to the laboring interests of the entire nation.

In discussing the effect upon the white race of Asiatic invasion, the distinguished writer, Sir Henry Wrixon, of Melbourne, says: "The United States, the newest and vastest of nations, where all the social problems of the sons of men are cast in the crucible of experience, has not dealt so effectively, so far, with the question of Mongolian or Asiatic invasion as have Australia and New Zealand." But when it is realized that the displacing of white laborers in California, Oregon, and other Pacific Coast States affects industries as far east as the Atlantic, Congress will learn that the question is not a local one.

MANUFACTURING AND OTHER INDUSTRIES IN CHINATOWN, SAN FRANCISCO.

During my investigations in San Francisco I endeavored to secure information respecting the number of operatives employed in the various lines of manufacture in Chinatown. So far as I could ascertain, no reliable data had been compiled on this subject. One of the chief characteristics of the Chinese race is secretiveness in all affairs pertaining to their business. All inquiries at their stores, manufacturing, and places of business were met with the ever-ready response, "Me no sabee."

Through courtesy of the Hon. F. B. Meyers, commissioner of the bureau of labor statistics of the State of California, arrangements were made whereby the heads of the various manufacturing and other industrial establishments in Chinatown were subpoenaed to appear at the labor commissioner's office and give testimony upon the subjects under inquiry. A large number of witnesses were examined, and the data herewith submitted are, I believe, complete and reliable.

In many instances it was impossible to secure accurate information as to the

¹ The following report was made in May, 1900, one month before the Chinese inspection service was transferred from the customs service to the Bureau of Immigration. Certain references to the conflict of authority with customs officers should be read with this correction in view.

number of operatives employed in the various manufacturing establishments, as the operatives would, upon the least signal of the approach of myself and those assisting in the investigations, disappear from the workshops through innumerable doors before we had time to count their number. In a majority of instances, therefore, we simply counted the number of sewing machines in each place, allowing one operative for each machine, which is certainly a conservative basis for the tables submitted below.

Nearly all of these sewing machines are operated by gasoline engines from early morning until a late hour at night. In walking through the streets in Chinatown I have frequently heard the busy hum of hundreds of sewing machines in the crowded basements and factories as late as 9 and 10 o'clock at night.

MANUFACTURE OF CIGARS.

The cigar manufacturing business in San Francisco and other Pacific coast cities is completely monopolized by the Chinese. Many of the wholesale dealers in cigars handle the Chinese-made cigars and put them upon the market as "white-made" and in many instances as "union-made" cigars. In a statement given to me touching this subject by Mr. Fred. W. Wescott, president of the Cigar Makers' Union of San Francisco, that gentleman says that "fully one-third of all Chinese-made cigars are sold to the trade as the product of white labor." Mr. Wescott stated further that "were it not for the Chinese monopoly of this industry, San Francisco, which is now one of the poorest, would be one of the best in the world for cigar makers."

There are to-day about 1,200 Chinese cigar makers in the city of San Francisco. Their shops and factories are scattered all over Chinatown, where these busy toilers may be seen from early morning until late at night turning out cigars by the hundreds of thousands. The scale of prices paid to Chinese cigar makers varies, of course, with the different grades of cigars, and averages from 50 per cent to 33 per cent less than the union prices upon the different grades of cigars. White labor in the cigar manufacturing industry has been driven from the field, and San Francisco, instead of supporting from 2,000 to 3,000 white cigar makers as formerly, has to-day less than 200 union cigar makers, who have remained to struggle against this hopeless competition.

What has been true of the cigar industry has been and will be true of every industry in which American labor is met with Asiatic competition. It is in every instance a *bloodless struggle*, in which the white man must surrender and go down in humiliating defeat.

CHINATOWN INDUSTRIES SUMMARIZED.

The following summary of the industries of Chinatown, in San Francisco, includes only the principal manufacturing establishments. Thousands of Chinese who work for themselves as shoemakers, tailors, cigar makers, and in every line of industry are not included.

Name of industry.	Number of sewing machines.	Number of workmen.	Average hours.	Average wages.
Boots and shoes.....	251	11 to 12	\$1.00
Shirts.....	195	195	11 to 12	1.00

Overalls.....	448	430	11 to 12	1.00
Ladies' underclothing.....	168	168	11 to 12	1.00
Manufacture of cigars.....	1,200	10 to 14
Total.....	1,146	2,579

THE FRUIT-PACKING INDUSTRY.

The fruit-packing industry has become one of the most important industries in California. Within the last few months a large number of the leading corporations engaged in this business have consolidated under a single management. The testimony of the officers of a number of these companies, which was taken by me, disclosed that during the fruit-packing season a large percentage of the labor employed at the factories is Chinese. It is a fact, however, that is full of significance, that the largest fruit-packing company on the Pacific coast, the

Pacific Fruit Packing Company, owned and controlled by Chinese capitalists, employs more white than Chinese labor.

In the testimony given by Mr. Lew Hing, president of the *Pacific Fruit Packing Company*, that gentleman says that only about one-third of their help is Chinese; the balance are white women and girls, who are paid from \$1.25 to \$1.50 per day. When I asked Mr. Lew Hing why it was that a Chinese company should hire American girls and women in preference to Chinese, he replied: "We find that the American girls and women can do the work easier, are quicker and more handy than the Chinese, and can do much more work; so we give it to them."

LABORERS UPON RAILWAY LINES.

The data herewith submitted cover all of the principal railway lines in the West (except those of Washington) i. e., the lines of the Oregon Railway and Navigation Company—the entire Southern Pacific system west of Ogden, Utah; and the Santa Fe lines west of Albuquerque, N. Mex.

While the railway officials were at first disposed to be somewhat reluctant about giving information upon this subject, as soon as assurance was given that no improper use would be made of it and that no newspaper agitation on the subject was contemplated, they gave me their entire cooperation. I was treated with uniform courtesy by the officials of each of the above systems of railway, and without their assistance it would have been impossible to secure the information herewith submitted.

I find that there are employed upon all of the above lines 13,956 common laborers, of whom 9,475 are classified as "Americans;" this number, however, would have been greatly reduced had it been possible to segregate the foreign-born (chiefly alien) whites employed upon the lines of the Southern Pacific Company; the laborers upon the lines of Southern Pacific Company other than Asiatics and Mexicans having been classified as Americans.

As shown in the following tables there are employed upon the above lines 1,776 Asiatics and 2,705 alien whites, Mexicans, and Indians; 33 per cent of the entire number of employees being foreign born. As stated above, the percentage of the foreign-born labor as shown by these tables would be increased from 33 per cent to not less than 45 per cent had it been possible to segregate and classify the alien whites in the employ of the Southern Pacific Company.

Construction.—In the construction department of the Southern Pacific road there is employed a constantly shifting number of laborers; many of this class are Chinese and Japanese; the number ranging all the way from 100 to 1,000 or 1,500 as the exigencies of construction require. They are paid \$1.75 per day, for 10 hours' work.

a It was impossible to segregate the white employees on this line according to nationalities. There are, no doubt, a large number of white foreigners included among them. As I had no way of segregating them into classes, I have included them all under the head of "Americans."

b Mexican.

c Indians and Mexicans.

A large part of the construction work upon railway lines upon the Pacific coast is let out to contractors, and, so far as I could learn, Asiatic labor is employed very largely upon all such new or construction work.

NUMBER AND NATIONALITY OF ASIATICS EMPLOYED IN MINES.

Much to my surprise, I found that in some of the principal mining States of the West no departments or bureaus of mining have yet been organized, and no attempt has been made to segregate the nationalities of those employed in the mining industry. In order to secure data which I desired, I have resorted to every source from which such information might be obtained. In many instances I have written to the postmasters at or near the various mining camps, and the data herewith submitted on this subject are compiled from information which I believe to be reasonably accurate.

Most of the Chinese are employed at mining work in either gravel or placer.

Many Chinese companies buy or lease land, which is worked by Chinese miners. Very few, however, are engaged at quartz mining. Most of the Chinese who are employed about the large mining camps are employed in the capacity of cooks and camp attendants.

The data compiled as of the date of January 1, 1900, indicate that in California there are 16,415 white employees and 3,934 Chinese working in the mines. The wages of the Chinese range from \$1 to \$1.50 per day, whereas white miners in the same mines receive \$2 to \$3.50 per day. The hours are from 9½ to 10 per day. There are also between 3,000 and 4,000 Chinese employed at placer mining for Chinese companies and for themselves throughout the different mining districts of California.

California—Nationality, wages, and hours of miners.

County.	Number white.	Number Chinese.	County	Number white.	Number Chinese.
Amador	1,000	220	Riverside	225	75
Butte	600	200	Sacramento	140	60
Calaveras	1,186	100	San Bernardino	300	108
Del Norte	45		San Diego	550	50
Eldorado	1,000	110	San Luis Obispo	10	10
Fresno	150	11	Santa Barbara	10	10
Humboldt	105	50	Shasta	1,700	248
Kern	1,000	60	Sierra	500	45
Inyo	277	50	Siskiyou	900	585
Lassen	55	25	Stanislaus	15	
Los Angeles	71		Trinity	1,000	205
Madera	100	48	Tulare	50	25
Mariposa	700	114	Tuolumne	1,500	237
Monterey	200	48	Yuba	250	65
Nevada	1,500	600			
Placer	700	550	Total	16,415	3,934
Plumas	576	25			

In addition to the above, there are between 3,000 and 4,000 Chinese employed at placer mining for Chinese companies and for themselves throughout the different mining districts of California.

Oregon.—A letter from the committee on mining and mineral resources of the Portland Chamber of Commerce will explain the situation in that State.

"It is impossible to give the information desired in regard to the number or nationality of laborers employed in the mining industry in Oregon, for the reason that there is no reliable source from which this information can be obtained. Oregon has no State commissioner of mines, or any official whose duty it is to obtain such information. We have not the material at hand from which to make even an approximate estimate of the number of men employed in the mining industries of the State for the years 1897, 1898, or 1899.

"As far as can be ascertained but few Chinese or Japanese miners are employed in the quartz mines, but there are a large number of Chinese who work in gravel and placer ground, most of them on their own account, and, as they keep this up year after year, evidently make fair wages for themselves. The universal practice in the State is to allow 10 hours for a day's work, and wages range from \$1.50 to \$3.50 per day, according to locality, character of work, and skill of the man. In closing I will state that the number of men employed in the mining industries of Oregon for the present year will be probably double the number employed during the past year, and from present indications the field for good miners will be much greater in this State from now on than ever before.

"Very respectfully,

"J. F. BATCHELDER,

"Chairman Committee on Mining and Mineral Resources."

Arizona.—Most of the Chinese employed in the mining industry in Arizona are employed as cooks, servants, and men of all work about the mining camps. As in Oregon and California, a number of Chinese work at placer mining on their own account, and the number so employed varies considerably from time to time.

In the table given below the number of Chinese in the different towns and settlements in the Territory is given, with an estimated number of those who engage in the mining occupation:

Town.	Chinese population.	Number employed at mining.	Town.	Chinese population.	Number employed at mining.
Clifton	400	75	Macao	50	20

ASIATIC COOLIE LABOR IN THE AGRICULTURAL INDUSTRIES OF THE PACIFIC COAST.

The agricultural industries of the Pacific coast States, more than the railway, mining, or indeed any other industry, has been made to feel the baneful effect of cheap coolie competition. The passage of the so-called Chinese exclusion law in 1882 stopped, for the time at least, the hordes of coolie laborers who were pouring into the Pacific States.

The Chinese who are already in the United States have shown great enterprise and thrift, and are to-day devoting their attention to the industries in which they have become proprietors, such as mining, truck farming, etc. As a result the Chinese laborer demands and receives fairly remunerative wages; and so long as the exclusion law is honestly enforced this dangerous rival will be removed from the field of destructive competition.

Japanese immigration.—Close upon the retreat of the Chinese coolie, however, came the Japanese, equally menacing to the laboring interests of the country. Almost unnoticed, and without exciting either suspicion or alarm, has Japanese coolie labor crept into the country and established itself in almost every line of industry along our Pacific coast. Every vessel from the Orient that touched at our western ports left large numbers of these little brown toilers upon our shores. They were sent out in gangs to the farming and fruit-growing districts, and almost before the white labor of the coast was aware that this new foe was among them, it found itself displaced by a new rival more dangerous even than the Chinese.

The hop and sugar-beet fields, ranches, orchards, and vineyards are to-day filled with Japanese laborers. Even the Chinese laborer has been driven out by them, and in each of these several important fields of industry the Japanese coolie system is firmly established.

The official records of the immigration office do not show any startling increase in the number of Japanese immigrants to the United States. For the last 5 years they show an average of about 2,000 Japanese arrivals each year. The total number of Japanese immigrants for the fiscal year ending June 1, 1898, was 2,230, about 1,500 of whom were classified as farm hands and gave as their destination California. The total arrivals of Japanese in San Francisco for the fiscal year ending June 30, 1899, were 1,667, of whom 120 were females.

The records of the immigration office fail to account for the great hordes of Japanese coolies who have already secured a monopoly of the labor in the agricultural industries of the Pacific States. In the State of California alone there is to-day a great army of Japanese coolies, numbering upwards of 20,000. They do not colonize as do the Chinese: they are scattered about the State, doing work in the orchards, vineyards, gardens, and hop and sugar-beet fields.

They are more servile than the Chinese, but less obedient and far less desirable. They have most of the vices of the Chinese, with none of their virtues. They underbid the Chinese in everything, and are as a class tricky, unreliable, and dishonest.

The number of Japanese coolie laborers in California to-day is greater than the total number of Japanese arrivals shown by the immigration records at all of the United States ports for the last 10 years. How, then, came they among us? This is another Asiatic mystery. The movements, the motives, the coming and going of these stoical, strange Mongolians are as a closed book to the white races. As with the birds of passage, to-day there may not be one in sight, to-morrow they may be with us in countless thousands.

At the present time they are coming into the United States in constantly increasing numbers. The immigration records for the month of March, 1900, show that nearly 1,000 Japanese immigrants were landed during the month at San Francisco and Seattle. During the week of April 8, 1900, the arrivals reached the startling number of 500 at San Francisco alone, the total for 5 weeks being nearly as great as the entire Japanese immigration for the last fiscal year.

In addition to those who come through our ports, thousands more enter the United States illegally over the border from Canada and British Columbia. Touching this subject, the statement of Mr. Frank C. Schuyler, Chinese inspector at San Francisco, but formerly stationed at Seattle, Tacoma, and Port Townsend, was taken.

Mr. Schuyler says that it is notoriously known that large numbers of Japanese are constantly coming into the United States by the Canadian Pacific Railway from Vancouver, that they are employed as contract laborers upon the railways and in the mines, and that it is a matter of common knowledge that the railway companies operating between British Columbia and the United States encourage and aid such illegal immigration.¹

In a statement secured from Hon. William Jones, president of the labor commission at Nanaimo, British Columbia, that gentleman says: "Nearly all Chinese and Japanese who come to this country (British Columbia) are brought in under contract; but it is extremely difficult to prove the existence of such contracts." Mr. Jones cites an instance where 200 Japanese coolies were imported under contract to work in coal mines. He says further: "There is of course some smuggling done over the border, and large numbers of Chinese and Japanese enter the United States in this way. It is said that the headquarters of those engaged in this illicit business are at Victoria, British Columbia, and Spokane, Wash."

Investigation by State labor bureau of California.—About two years ago the subject of Japanese immigration was investigated by the State labor bureau of California. Through the courtesy of ex-labor commissioner, Hon. E. L. Fitzgerald, and his assistant, Hon. Cleveland L. Damm, of San Francisco, the testimony taken during such investigation was placed at my disposal. A large number of employers of Japanese labor were examined. The testimony of many coolie laborers was also taken. It was shown that in nearly every instance the Japanese immigrants came into the United States in "bands" or "gangs" of 25 and upward.

One very significant fact developed, namely, that nearly all of the coolies who were examined testified that they had not come to San Francisco direct, but had come from the north, most of them having landed at Vancouver, British Columbia.

It was shown that there exists in San Francisco, Seattle, and other Pacific port cities a system of Japanese boarding houses, the keepers of which act as middlemen in the procurement of "gangs" of coolie laborers. It was likewise shown that these boarding-house keepers are in constant communication with their friends and relatives in Japan, also with certain so-called immigration companies in that country. Upon arriving in this country the Japanese immigrants go at once to one of these boarding houses, and within 2 or 3 days after arrival are sent out in gangs, under a boss, into the fields, orchards, and vineyards.

One of the witnesses at this investigation, a Mr. Kolb, a fruit grower of Pleasanton, Cal., stated that nearly all of the labor employed in the hop and sugar-beet industries is Japanese, with some Chinese. Mr. Kolb referred to a notorious Japanese boss by the name of Sato, who, he claimed, had brought a great many Japanese into the country. When asked if he knew where Sato secured the Japanese, he replied, "I do not know exactly, but it looks to me as if he gets them from Japan."

Mr. A. R. Downing, another witness, testified that he is a resident of Pleasanton, Cal.; that "he has made a business of contracting for the cultivation of sugar beets, etc.; that nearly all labor employed is Japanese; that the average wages paid this class of labor was from 85 cents to 90 cents per day, out of which they board themselves."

Mr. A. C. Platt, a former member of the Pleasanton Hop Company, testified

¹ See Mr. Schuyler's statement, Exhibit A.

that he was "in favor of employing white labor exclusively; that there is plenty of white labor in California to handle all of the crops, and that he withdrew from the company because the balance of his associates in business insisted on employing Japanese coolie labor."

Mr. Platt also testified that upon one occasion he had a conversation with the Japanese boss—Sato; that "Sato wanted to take hold of the work at the ranch, and wanted me to go in with him and get men from Japan; that the men would get only \$4 or \$5 a month." Mr. Platt says he told Sato he "didn't want anything to do with that kind of business."

There can be no doubt that there are in this country hundreds of bosses of the Sato type, who make a business of bringing coolie laborers into the country. While it is extremely difficult to prove that such laborers are brought in under specific contract, the methods employed are without question as much a violation of the contract-labor law as if specific contracts were made in each instance.

In this connection reference is made to the affidavit of the Hon. Cleveland L. Dunn, former deputy labor commissioner of California, which is attached hereto as Exhibit B.

JAPANESE IMMIGRATION COMPANIES.

As has been stated above, the Japanese bosses and boarding-house keepers in the United States are in constant communication and cooperation with certain so-called immigration companies in Japan. These companies make a business of encouraging and recruiting coolie immigration to the United States. Four of the principal companies of this character are known as the "Kosi Inan Kawaisha," "Nihon Goshi Inan Kawaisha," "Hiroshima Inan Kawaisha," and "Kobe Inan Kawaisha."

A contract is entered into by one of these immigration companies with every Japanese immigrant coming to the United States. By the terms of the contract it is provided that the immigration company shall secure passage for the immigrant to the United States, with necessary passport, and that it shall provide for all his creature comforts while en route, and return him to Japan in case of sickness. Fully 80 per cent of all the Japanese who come to the United States are classified, as shown by the reports of the immigration office, as farmers. The wages of farm hands in Japan are 3 to 4 yen per month, or about \$1.50 American money, without board or lodging; yet everyone of this class of immigrants, after paying passage to the United States, is able to show to the immigration officers \$30 in gold. It is understood by the immigrants that they must have at least this amount in order to secure landing in the United States.

It is a fact full of significance that of the hundreds of coolies who are constantly coming into the United States every one produces just \$30 in gold; no more, and no less.

That the entire system of immigration companies, boarding-house keepers, and Japanese bosses is but an elaborate and ingenious method of avoiding our contract labor laws no one who has investigated the subject can doubt.

The following is an exact translation of one of the immigrant contracts referred to:

Contract.

The Nippon Inin Goshi Company will contract, accepting the request for transportation, of Yoshida Ichitaro, who is a free emigrant, having the purpose to land in San Francisco, North America, and to secure for him work there, within the limitations prescribed by the immigration laws.

1. The emigrant shall perform everything that is needed for getting the passport and must be responsible for all expenses needed for the voyage, and should have the money which is necessary when landing.

2. The maturity of the contract is three years from the date that the emigrant starts.

3. If the emigrant gets sick, or loses the means to get along, Narita Toyashira, agent, will help him and provide him means to get back to Japan in case it is necessary.

4. If the emigrant is sent back at the expense of the Japanese Government the company shall pay all the expenses for the emigrant.

5. The emigrant shall pay 10 yen to the company as its fee. If the emigrant has a child who does not exceed the age of 15 years, the charge for it will be half price, and if the child is not exceeding 10 years of age, he will be carried free of charge.

6. The emigrant shall provide two securities to the company according to acts 3 and 4 hereof, and they will be responsible to pay all of the expenses that have been paid by the company under the provisions of sections 3 and 4.

7. The two securities are responsible in all the matters pertaining to the emigrant.

This contract is made in duplicate, one to the emigrant and one to the company.
Meiji, 31st year (1898), 1st month (January), 31st day.

HAMANAKA HACHITARO,
Special Manager Japan United Immigration Company.

Emigrant:

YOSHIDA ICHITARO,

Securities:

YOSHIDA YOHEI.
YAMAMOTO KUSU.

There is every ground for the belief that the \$30 which is exhibited by the immigrant to the United States officials is furnished by the immigration company. The whole scheme is a flagrant violation of our contract labor laws. The class of Japanese immigrants who are thus enabled to come to the United States are of the most objectionable character, and without the assistance of such organizations would be compelled to remain in Japan. The United States Government should take immediate steps to suppress these immigration companies.

The great danger to the laboring interests of the United States of unrestricted Japanese immigration will be better understood after an examination of the following table showing the prevailing rate of wages paid in Japan in the various lines of industry:

Japanese wage rates per day.

	Yen. ^a	United States money.
Carpenters.....	0.55	\$0.28
Plasterers.....	.55	.26
Stonemasons.....	.65	.31
Paper hangers.....	.50	.24
Joiners.....	.60	.29
Tailors for Japanese clothing.....	.50	.24
Tailors for foreign clothing.....	1.00	.48
Blacksmiths.....	.75	.36
Printers.....	.40	.19
Ship carpenters.....	.60	.29
Compositors.....	.60	.29
Common laborers.....	.40	.19
Confectioners.....	.35	.17
Farm laborers, per month.....	3.00	1.44

^a A yen is valued at 48 cents.

It is little wonder that these strange foreigners, when they come to the United States, are willing to work for 60 and 70 cents a day, which is more than double the wages for which they were compelled to work in Japan. As a result of this unnatural competition the white laborer has been driven from the field wherever the coolie system has found a foothold.

In 1898 California produced 17,329 tons of beet sugar. On account of unexpected drought during the season the total amount of beet sugar produced in the State was about 50 per cent less than the usual annual product. Capitalists who have gone into the beet-sugar industry have brought into the United States hundreds of coolie laborers from Hawaii, China, and Japan. The same system of coolie labor that has been the curse of the Hawaiian Islands for years has been brought to the United States.

California produces annually about 10,000,000 pounds of hops, and fully 75 per cent of the labor employed in this great industry is likewise Chinese and Japanese, principally the latter.

I have asked many of the leading manufacturers and employers of the coast why preference is not given to white labor. The invariable reply has been "because white labor is too independent; it occasions too much trouble to the employer; the gang or boss system is far less troublesome, and besides, the Japanese and Chinese labor is cheaper." Other employers have told me that they would prefer white labor, but that it is unreliable; that most of the common white laborers of the coast are tramps or hoboes.

This is, no doubt, in a measure true. More tramps can be seen traveling along the highways and railways of the Pacific coast States than in any other part of the United States that I have ever visited. The question is, What has made them

tramps? That the unequal and unnatural battle which the white laborer of the coast has been compelled to wage against his Asiatic competitor is directly responsible for this deplorable condition I have not the slightest doubt.

The records of the State bureau of labor statistics of California show that during the hard times in 1895-96 over 15,000 white laborers of California were out of employment. The thousands of women and children who were dependent upon them for support were suffering from want and hunger, and yet during all of this distressing period the 30,000 coolie laborers in the State were, for the most part, regularly employed. Cheap labor, like cheap money, is always the last to be out of employment.

RELATION OF ASIATIC IMMIGRATION TO CRIME.

For the purpose of comparison I have secured data from the official records of the cities of San Francisco, Cleveland, and Cincinnati, showing the total number of arrests for crime in each of the cities named for the year ending June 1, 1899. The degrading effect of Asiatic competition upon the white laboring classes of the coast is, it seems to me, forcibly illustrated by a comparison of these figures. Thousands of white laborers, when forced to face the alternative of working side by side with the coolie and receiving a coolie's wage or becoming tramps, have chosen to take to the highways. The population of San Francisco, Cleveland, and Cincinnati is about the same, and yet the number of arrests for crime in the city of San Francisco during the last year was greater than the combined number of arrests in the cities of Cleveland and Cincinnati.

Comparative statement of arrests for drunkenness, burglary, grand and petit larceny, and vagrancy in the cities of San Francisco, Cleveland, and Cincinnati for year ending June 1, 1899.

	Popula- tion.	For drunk- eness.	For bur- glary and larceny.	For va- grancy.
San Francisco.....	350,000	12,183	1,390	2,836
Cleveland.....	380,000	7,686	1,020	142
Cincinnati.....	290,000	2,124	863	504

Total arrests for all offenses during year.

San Francisco.....	28,013
Cleveland.....	14,452
Cincinnati.....	10,010

The above figures tell their own story. The appalling number of arrests for vagrancy in the city of San Francisco can be accounted for upon no other theory than that the white toilers of the coast have gone down in hopeless defeat in the unequal struggle with their Asiatic competitors. It has been said that the currency of a nation is always debased to the level of its baser standard coin. It is equally axiomatic that the labor of a community is always degraded to the level of the lowest type of labor with which it must compete. Oil and water will not mix. American laborers may be hoboized; *they will not be coolieized.*

SMUGGLING OVER THE CANADIAN AND MEXICAN FRONTIER.

As already stated large numbers of Chinese and Japanese come into the United States every year from Canada and British Columbia. The line of frontier is so extensive that it is next to impossible to police it effectively. I think, however, that if the Government were to guard more carefully the railway lines operating over the border the number of coolies who enter the United States upon these lines would be greatly reduced.

Hundreds of Chinese immigrants who are denied landing at Seattle and San Francisco secure passage to some Mexican port, usually to Ensenada, from which they work their way over the Mexican border into the United States. Many of them when approaching the border line along the coast wait until low tide and follow the coast line into the United States over the border, the tide water obliterating all marks of the trail behind them. These Chinese are assisted by their countrymen who live at different points along the border, and between them a regular system of signs and communication has been established.

MEXICAN PEON LABOR.

As appears by the tables showing the number and nationality of laborers employed upon the railways of the coast it will be seen that large numbers of Mexicans are employed on some of the lines, notably upon the lines of the Santa Fe company. A large percentage of such Mexicans are aliens who reside on the Mexican side of the line and who come into the United States as laborers.

In the fruit-gathering season hundreds of Mexicans living near the border line are employed annually under contract and come into the United States and work in the orchards, vineyards, and fruit ranches. The American rate of wages is double that of the Mexican. The Mexican peon laborer is little if any better than the Japanese coolie, and the competition of the Mexican is quite as disastrous to white labor as is that of the Chinese and Japanese.

THE CHINESE EXCLUSION ACT.

In 1880 the tide of coolie immigration to the United States from China had attained such alarming proportions that the American people awakened to the fact that unless immediate steps were taken for its suppression the white labor of the Pacific States would be driven back eastward over the mountains and the field abandoned to the Chinese.

A commission was appointed by President Hayes to visit Peking and present the situation to the Imperial Government, to the end that some agreement might be reached which, while respecting the dignity of the Chinese Government, would secure protection to the laboring interests of the United States. As a result the famous immigration treaty of 1880 was framed, and in 1882 "the Chinese exclusion act," so called, was enacted by Congress.

Class legislation is always objectionable, and legislative discrimination against an individual, class, or nation can be justified only by the most urgent and extraordinary necessity. To the honest toilers of all climes and nations who, tiring of the oppression and limited opportunities which surround them in the Old World, are anxious to avail themselves of the advantages of a free government, the United States has been ever ready to extend a generous welcome. Hundreds of thousands of foreigners have come to our shores, have joined our great army of toilers, and are to-day respected citizens of their adopted country.

The European immigrants are rapidly and easily assimilated. The peculiarities of race yield speedily to new conditions and surroundings. The Irishman, the Englishman, the German, the Frenchman, and Swede of yesterday is to-day an American. Not so with the Asiatic immigrant. There is between the white and Mongolian races an impassable gulf. The two races will not assimilate. The Asiatic immigrant who comes to the United States retains all of his race peculiarities; he remains an Asiatic; he can not be Americanized. The Japanese, while adopting the dress and manners of the American, remains just as much a foreigner as his Mongolian brother, the Chinese. Neither the Japanese nor the Chinese who come to the United States have, as a class, the remotest interest in our Government or our laws. They are no more a part of us than are their countrymen in Yokohama and Hongkong.

It is in the exceptional and extraordinary character of Asiatic immigration that the exclusion law finds its justification. And I predict that the time will come, if indeed it is not already at hand, when the interests of American labor will demand that its provisions be so extended as to prohibit the coming into the United States of the "coolie" classes of all foreign nations.

The purpose of the "Exclusion act" is to exclude only the "coolie" or laboring classes of Chinese immigrants. Chinese merchants, doctors, artists, students, and, in fact, all Chinese other than common laborers, are, by the terms of the treaty and the act, exempt from its provisions.

It is a fact, however, that, as the law is at present administered, the greatest hardships are imposed upon the merchants and others of the exempt classes of Chinese immigrants. A Chinese merchant applying for landing in the United States must establish his identity and standing as a merchant. If he is returning to the United States after a visit to China his papers must be examined by the Government officials, and in many cases they are forwarded to the city in which the merchant claims residence for investigation. Pending such investigation the immigrant is held in detention by the steamship company. The place provided by the Pacific Mail Company at San Francisco for the detention of such immigrants is called the "Detention loft."

It is the duty of this Government in the interest of humanity to see that something is done to compel those who have charge of Chinese immigrants, pending the investigation of their right to land in the United States, to give at least a small measure of consideration to their comfort and creature welfare. The

steamship companies who bring these immigrants to our shores receive compensation for the care and keeping of each of them until they are landed, and they should be compelled by the Government to make proper and reasonable provision for their comfort.

I suggested to the officials of the Chinese bureau as early as January last that I saw no valid reason why, in the cases of all Chinese merchants and others of the exempted classes, who desired to visit China with the expectation of returning to the United States, the investigation respecting the business, identity, and status of such Chinese might not be made and his status fixed prior to his departure. Upon his return to the United States the only proof necessary will then be proof of identity. This can be readily furnished, and the further detention of bona fide Chinese merchants for weeks, and in some cases months, in the vile detention lofts will be avoided.

I am much pleased to note that as recently as March last the Treasury Department issued to the officials at the several ports instructions upon this subject, and that hereafter the status of Chinese merchants will be inquired into and established, at least prima facie, prior to their departure from this country, instead of at the time of their return.

FRAUDS COMMITTED BY CHINESE IMMIGRANTS.

The records at the Chinese bureau at San Francisco show that an average of between 3,500 and 4,000 Chinese persons enter the United States at that port each year.

The following tables, compiled from the official records at the Chinese bureau at San Francisco, will give a very correct idea of the extent and character of Chinese immigration at the present time:

The tables given below cover the two last fiscal years, ending June 1, 1898, and June 1, 1899, respectively.

Number of Chinese applying for admission to United States, number admitted and rejected.

JULY 1, 1897, TO JULY 1, 1898.

Month	Total applying.	Admitted.		Total admitted.	Rejected		Total rejected.
		Males	Females.		Males.	Females.

^a The section 6 certificate is issued only to Chinese immigrants other than laborers; such certificates are issued in compliance with section 6 of the Chinese exclusion act, which provides that all Chinese persons other than laborers who may be entitled by the treaty or act to come within the United States shall, before leaving China, obtain permission from the Chinese Government, with a certificate showing such permission, the name, occupation or profession, etc., of the immigrant.

There has in the past years been a great deal of irregularity at some of the customs districts in the admission of Chinese persons in the exempt classes. Section 6 certificates have in many instances been issued to cooly laborers, who have been allowed to come into the United States as merchants, students, and travelers.

Probably the greatest number of frauds are committed by the class of Chinese laborers who apply for admission on the ground that they were born in the United States, and are therefore "native sons." There has recently been a large increase in the number of arrivals who claim to be "native sons," their claims being supported solely by the unreliable testimony of Chinese witnesses.

The following table contains a comparative statement showing the total number of arrivals of Chinese by months, and number of "native sons" during corresponding months, for the two last fiscal years:

Total number of Chinese admitted at San Francisco under exempt class as "native born" compared with total admissions for fiscal years 1897-98 and 1898-99.

Month.	July 1, 1897, to July 1, 1898.			July 1, 1898, to July 1, 1899.		
	Total admissions, all classes.	Native born.	Per cent native born.	Total admissions, all classes.	Native born.	Per cent native born.
July	325	37	11½	338	94	27½
August	374	14	3½	542	95	17½
September	373	20	5½	282	79	28
October	379	45	11½	480	53	11½
November	313	35	11½	286	58	20½
December	379	51	13½	274	68	25
January	178	48	27	211	83	39½
February	98	34	33½	160	56	35
March	180	48	26½	146	17	11½
April	200	62	31	191	18	9½
May	556	99	17½	222	39	17½
June	409	97	23½	503	60	11½
Total	3,764	590	15½	3,635	720	20

At least 75 per cent of the Chinese admitted as "native sons" are common cooly laborers. Many officials with whom I have talked do not hesitate to say that fully 90 per cent of the alleged "native sons" cases are frauds, and that not to exceed 10 per cent of the applicants claiming to be "native sons" are entitled to land as such.

CHINESE LAWYERS.

In every important port there are certain unscrupulous lawyers who devote their entire time to the Chinese business. Some of them, of course, do a perfectly legitimate business. The Chinese merchants in our Western coast cities have important commercial interests, and I have met a few attorneys who have a large and important Chinese clientele, who are an honor to their profession. I speak more particularly of the class of lawyers who are constantly hanging about the Chinese bureau and the customs offices, and whose services are invariably sought in the attempts to secure the landing of coolies and slave girls. It is notorious that some of the lawyers of this class work hand in hand with the worst classes of the Chinese, furnishing false testimony, suborning and intimidating witnesses, and resorting to every means, fair or foul, to secure the landing of their clients.

It is the unquestioned right of every Chinese immigrant to be represented by an attorney if he desires one. The large fees which the Chinese are willing to pay, however, serve as an immense corruption fund, which is constantly used to defeat the objects of the exclusion law. If Congress would fix a maximum fee in each case, commensurate with the services actually rendered, and constitute it an offense for any attorney to ask or receive, directly or indirectly, any further or additional compensation, it would, in my judgment, tend to eliminate one of the principal elements of fraud in connection with Chinese immigration.

HIGHBINDER AND HIGHBINDERISM.

There exist in the city of San Francisco numerous "tongs," or associations of Chinese of the criminal class, organized for the express purpose of committing crime. They exist on blackmail and pay large sums annually for the protection of gambling houses and other disreputable places which are conducted by the members of these "tongs." The word "tong" is the equivalent of "society," "company," or "organization."

There are in San Francisco at the present time the following highbinder tongs: Chee Kung Tong, Suey On Tong, Bow On Tong, Hop Sing Tong, Hip Sing Tong, Suey Sing Tong, Wa Bing Shoon Tong, Bing Gung Tong, Bow Sin Sere Tong, Gi Sui Sere Tong, Hip Yee Tong, Quong Duck Tong, Jo Lung Sen Tong, An On Tong, and Jew Yee Tong.

The tongs or companies of this character must not be confounded with the so-called "Six Companies" or other Chinese organizations which are purely commercial and beneficial in their character.

Among the 25,000 Chinese population of the city of San Francisco about 1,000 represent the worst class of criminals on earth. Many of them have been compelled to flee from their native country on account of crimes committed there. They live without work and fatten upon the prosperity of others of their race. They impose fines arbitrarily and levy blackmail at will. If payment is resisted or refused, they do not hesitate to sentence to death the person who refuses to meet their criminal demands.

The highbinder tongs hold secret sessions, the business of which is to arrange for the collection of tribute. Each tong has its regularly appointed "soldiers," who are commonly known as "Hatchet Men." It is the sworn duty of these Hatchet Men to murder all those who have invoked the displeasure of the tong whenever directed so to do.

These vicious and criminal societies are a constant menace to the peace and good order of society. They exist for the purpose of committing crime. They review and nullify the judgments of our courts with utter disregard for our laws. They have their own tribunals, before which offenders are secretly tried and sentenced to death, and such sentence is executed by their paid assassins. They have no respect whatever for the oath administered in our courts. They even make use of our courts, if necessary, to enforce the arbitrary and secret decisions of their own tribunals. One instance in particular was called to my attention in which an innocent Chinese merchant, as a result of a conspiracy on the part of the highbinder tongs, was accused of murder, tried and convicted in the courts of California, the highbinder societies furnishing all of the witnesses against him. It was afterwards learned that all of the testimony given at this trial was false; that the witnesses had been furnished by the highbinder society which had made use of our courts to take the life of one who had fallen under its displeasure.

It is this criminal class of Chinese members of the several highbinder tongs who make a business of bringing to the United States slave girls and cool laborers. As high as \$3,000 in gold is frequently realized from the sale of a single Chinese slave girl in the city of San Francisco. The hundreds of cool laborers whom they succeed in bringing into the country are hired out in "gangs," under the direction of a "boss," who collects their wages, the principal part of which is paid over to some company of the highbinders. The condition of this class of laborers is little better than that of slaves. They have little or no personal freedom; they are compelled to work on year after year and receive but a small portion of the fruits of their toil. If any one of them revolts against his masters or seeks to assert his personal liberty he is promptly assassinated.

The power of the highbinder tongs among the Chinese population is almost absolute. So great is the dread inspired among the Chinese by these societies that few have the courage to resist their criminal demands. The State and municipal authorities have been powerless to suppress the crimes of the highbinders, for the reason that no Chinese witness has the courage to appear and give testimony against a highbinder. Every witness who should so appear and testify would be marked for death. The Chinese people as a race is peace-loving; there is little of the warlike spirit among them, and they have not the courage to take a bold stand against this species of outlawry, which is a constant menace, not only to their prosperity but to their lives as well.

I think it a conservative statement when I say that fully 90 per cent of all the frauds committed against the Chinese exclusion act in the bringing into the United States of slave girls and coolie laborers is inspired directly by these highbinder societies. Subornation of witnesses and procurement of false testimony is a part of the business for which they are organized. I have heard of instances in which reputable and highly respected Chinese merchants have, under fear of personal violence from the highbinders, been compelled to give false testimony in cases where these criminal organizations have desired the landing of cool laborers or slave girls.

Most of these tongs have in their regular employ some attorney of the class heretofore referred to. These attorneys are paid regular annual salaries, in addition to fees in special cases, for their work in behalf of these tongs.

It is my opinion, after a most thorough and careful investigation of this subject, that if the country could be rid of this criminal class of Chinese, and the highbinder societies or tongs permanently suppressed, one of the greatest factors in the commission of fraud in the administration of the Chinese exclusion laws would be eliminated.

In discussing this phase of the Chinese question with Dr. John Endicott Gardner, interpreter at the Chinese bureau, San Francisco, that gentleman said: "Fully 75 per cent of all of the frauds committed at the present time against the exclusion law can be traced directly to the highbinder organizations." Dr. Gard-

ner, in addition to his position as official interpreter for the Government, occupies the chair of Oriental languages at one of the western universities. He is a highly cultured gentleman, and, having spent many years in missionary work in China, has greater familiarity with the language, manners, and customs of the Chinese race than anyone whom I have ever met. The Government is exceedingly fortunate in having as interpreter at such an important port as San Francisco a gentleman of the ability, high standing, and character of Dr. Gardner.

Attached to this report is an extended statement given to me by Dr. Gardner touching many of the points covered in this report. Dr. Gardner's statement is highly interesting and is attached hereto, marked "Exhibit C."

Attached to Dr. Gardner's statement are numerous exhibits, the same being original translations from Chinese documents, as follows:

Exhibit A.—Letter of instructions to a highbinder or salaried "soldier" to kill another.

Exhibit B.—Contract for the sale of a Chinese slave girl, which is in the regular form in constant use among the Chinese who are engaged in this nefarious practice.

Exhibit C.—Coaching paper or catechism furnished by highbinders to Chinese slave girl to be used by her for the purpose of procuring landing in the United States.

Exhibit D.—Voluntary statement of a Chinese slave girl known as "Lee Yow Chun." This statement is made by the slave girl at the Presbyterian Mission Home at San Francisco, to which the girl had fled from her captors. The translation is by Dr. Gardner.

Exhibit E.—Intercepted letter from a highbinder to the officers of his tong.

Exhibit F.—A translation of a letter of warning received by Dr. Gardner from a Chinese friend, advising him that the highbinders had placed a price upon his (Gardner's) head.

An examination of the above exhibits will throw much light upon the methods of the criminal organizations known as the highbinders.

Mr. William Price, lieutenant of police of San Francisco, in speaking of the highbinders, says:

"Their places are finely fitted up, the same as club rooms. There they meet as other organizations do. If a member has anything against another man he places his case before the society and offers so much money to have the man killed. After they have settled on the man to be killed, his head is as good as gone. The societies' rules are so binding that those who are chosen are bound to kill their victim even if there were twenty policemen standing about at the time."

Lieutenant Price says there are about 3,000 Chinese highbinders in San Francisco at the present time, who are nothing but cutthroats and bad men. He styles them "the worst class of people on the face of the earth. They do not molest the white people, as they fear an uprising against their race in the event that any white man was killed." Lieutenant Price states further that "one of the by-laws in all of the highbinder societies is to the effect that every highbinder is obliged to aid in the landing of cooly laborers and Chinese slave girls."

Through the courtesy of United States Commissioner of Immigration North, of San Francisco, who served as one of the commissioners before whom the investigation into the practices of highbinders was heard about 2 years ago, much of the testimony taken at that investigation was placed at my disposal. Some of the important parts of this testimony is submitted herewith as part of my report. They are: Statement of William Price, lieutenant of police, Exhibit D; statement of "Chun Ho," rescued slave girl, Exhibit E; statement of Miss Donaldina Cameron, matron Presbyterian Chinese Rescue Home, Exhibit F.

During my investigations of this subject a number of very prominent and wealthy Chinese merchants in the city of San Francisco visited me at my hotel, most of them coming secretly in the nighttime, as they were fearful that violence would be done them if it became known to the highbinders that they had been to see me. Every one of these men substantiated what Dr. Gardner had said respecting the frauds committed in the landing of coolies and slave girls. They insisted that if the highbinder societies could be broken up that the source of nearly all of the frauds committed against the exclusion act would be removed.

That the State and municipal authorities of California were powerless to break up these organizations all of the Chinese with whom I talked were agreed.

As a result of my investigation I have reached the conclusion that the only way in which this evil can be reached and the country rid of this vicious and disturbing element is for Congress to take the subject in hand.

Ninety-five per cent of all the members of the highbinder societies are aliens and criminals of the worst type. The one thing which they fear above all others, hold-

ing it in greater dread than all of our laws, our courts and jails, is deportation to China. The purpose of the highbinder organizations is vicious and criminal. They should be suppressed by law of Congress, and membership therein, or in any society having for its purpose the commission of crime, or the violation of our laws on the part of aliens residing in this country, should render such aliens liable to deportation.

In this connection I take pleasure in referring to the statement of the imperial Chinese consul-general at San Francisco, Ho Yow, marked "Exhibit G," attached to this report.

Also to statement of a Chinese merchant of San Francisco, marked "Exhibit H," and hereto attached.

EXHIBIT A.

STATEMENT OF FRANK D. SCHUYLER, CHINESE INSPECTOR, SAN FRANCISCO, CAL.

Q. What is your official connection with the Chinese bureau, Mr. Schuyler?—A. At San Francisco, as an inspector.

Q. How long have you acted in such capacity?—A. I think since about the 8th or 9th of last January, during which time I have had about 30 days' leave of absence.

Q. Prior to that time where had you resided and what was your business?—A. Chinese inspector in Seattle, Wash., since the 1st day of September, 1893. I was appointed in New York about the 8th of August, 1893, and proceeded to Seattle, where my official station was designated, arriving there about the 1st day of September, 1893, and have been in actual Government service ever since.

Q. During the time that you were stationed in Seattle, are you able to state approximately the number of Chinese that were landed there annually?—A. I can not, as Port Townsend was the principal landing place.

Q. During your connection with the Government service at Seattle what percentage, if any, of the total admission of Chinese to this country would you think were not entitled to admission, or were admitted upon proofs that you have reason to believe were false?—A. Very few, as it is not a large place; and there are not more than 17 to 20 Chinese firms in Seattle to-day.

Q. What would you estimate the total Chinese population to be in Seattle?—A. It varies; in the summer there are only about 250 to 300, as they go away.

Q. Are there any considerable number of Japanese there?—A. Yes.

Q. From what Japanese ports do they come principally?—A. I can't say. They come to this country via the Canadian Pacific steamers via Vancouver.

Q. Do any considerable proportion of the Japanese immigrants who land in Seattle remain in that country?—A. Prior to my going away it was notoriously known that they came in by the Canadian Pacific Railway from Vancouver to Seattle and from Tacoma to Puyallup, which is between Seattle and Tacoma, where they congregate in large numbers, and went to work for the railroads as contract laborers.

Q. Upon what railroads was it reported that they were employed principally?—A. The Northern Pacific and Great Northern.

Q. Have you any reason to think, through facts that have come to your knowledge, that these Japanese who landed and went at once to work on the railroads came from Japan for that purpose?—A. I think so, as I have seen Japanese come in on the railroad and from a certain mark or peculiarity on their faces we would know that they were the same who were sent away on the train the next day.

Q. Were they in charge of a boss?—A. Apparently not, although there was always some one who spoke English.

Q. About how many that land in that country go out to work in the mines and on the railroads in the course of a year?—A. All the way from 20 to 50, day after day, for a long time, and then there would be a lapse, so it is hard telling.

Q. Did you ever hear of any Japanese agency or employment bureau through whom these laborers were furnished?—A. Yes; there was a firm there who it was generally supposed had the handling of these Japanese, and the general supposition was that they were the ones who brought them here under contract.

Q. Who would you recommend that I call upon as being the persons most likely to put me in touch as to the details on this subject?—A. Col. F. D. Heustis, collector of customs at Port Townsend, will be able to give all the data on the Japanese immigration question. There is an immigration commissioner at Vancouver who is also well informed.

Q. What do you know upon the subject of wages paid to the Japanese laborers in that country?—A. Only upon representation, which is very much less than any other class of labor.

Q. What do you know upon the subject of Chinese landing in British Columbia and illegally entering this country over the lines?—A. It was a notorious fact that the Chinese landed in this country, coming via the Canadian Pacific Railway via Vancouver and Victoria, large numbers at a time, but that there was no increase in the local population, and the query always remained as to what had become of them. Every man must have \$50 when he lands as evidence to the Canadian Government that he is no pauper. This certificate must be renewed every 6 months, and if a man desires to leave the country his head-tax receipt is taken up until he again seeks admission to the United States, when it is returned to him.

Q. Is it not also notorious that the railroads operating between British Columbia and this country encourage rather than discourage the transportation of Chinese to this country?—A. Not Chinese, but the Japanese, I believe.

Q. What have you ever heard of immigration companies located either here or in Japan making a business of furnishing the head money of \$25 or \$30, as you state they must have, for the purpose of having him exhibit it here?—A. At one time, when two Japanese were rejected for not having the sufficient amount of money, a collection was made up among some Japanese at Victoria, so that they would all have \$35 or \$30 when they got to San Francisco. They were under the impression that having passed at Victoria they would not be subject to examination at San Francisco. The emigration agent at Vancouver, whose name I can not recall, told me that he had discovered the existence of a company, I think in Kobe, Japan, where they furnished the passage money, and the agents in this country see that the head money is given to the emigrants as they come in; that if a man in Seattle wants 500 men he sends to Kobe, Japan, and they come here by the Canadian Pacific line or the Japanese line.

Q. The general impression then, you would say, is that the greater part of the emigrants that come here come under such an arrangement?—A. Up there, yes; I have no knowledge of what happens here.

Q. What do you know as to the number of Chinese or Japanese who are employed in the principal railways or mines of that vicinity?—A. Japanese are employed on the railroads and Chinese are in the canning business. There are no Chinese employed on the railroads, excepting a few on the Northern Pacific who have been employed on that line for a number of years.

Q. From your knowledge and experience of the situation at Seattle what would you say as to whether the Japanese emigration has been on the increase in the last four or five years?—A. Decidedly on the increase. It has been said that as many as 4,000 to 5,000 have come in a month. I think that probably 1,200 to 1,500 would be a fair estimate.

Q. Do all of those who come in have to pass through the examination so that the Government is able to have a register?—A. I am not familiar with the form carried out on the Canadian side, but until lately they boldly walked in.

Q. Then the principal number come in over the British Columbia line?—A. I do not know, but would say that the larger number do.

Q. What practical suggestion could you make, from what you know of the situation, as to any reasonable method that might be adopted to check this emigration over the line?—A. The illegal entry over the line is simply a matter of policing the line. It is a matter of legal affairs.

Q. During your entire experience as an officer in the Chinese bureau you have observed, no doubt, that there are quite a percentage who ask admission as a native born?—A. That is practiced more here than at Seattle. We do not admit a Chinese as native born unless he has 2 white people as proof.

Q. I understand that in this city there is a resident Chinese population of about 25,000 to 50,000. About what percentage of that population would you say are women or females?—A. I do not know.

Q. Do you not think that the percentage of females is greater in the native born than the others?—A. Yes, at this place.

Q. What percentage of those who come on the native-born certificate do you think are fraudulent?—A. I can not tell, but at Seattle I do not think there were more than 2 per cent; but here I do not know.

Q. Out of the total admissions at this port in the last fiscal year 1 out of 7 or 8 make application as native born. Don't you think it impossible that this is so?—A. It may be possible, as Chinese came here as early as 1851 and were admitted unlimited.

Q. Why is it necessary to detain a Chinese merchant in the detention loft or

any other place for any extended period for the purpose of examining his papers, documents, etc., which on their face appear to be perfectly proper?—A. None, in my opinion. I think that all investigations in cases where no direct information of fraud is brought to the attention of the bureau should be made in the interim of the departure of the subject and his return to this country. It should be investigated upon his departure and filed subject to his return.

Q. Is it not a fact that upon the subject of landing slave girls illegally the high-binder institutions are really the persons who engage in that business principally and in most instances are interested in furnishing false proofs?—A. Yes.

Q. If some measure might be taken by the Government which might rid this country and other Chinese countries of highbinderism, would that not facilitate the law to a great extent?—A. I think the Chinese would work with you hand in hand.

Q. What would you think of a suggestion that a law be passed by Congress making membership proof of either crime or misdemeanor, which would render any member liable to deportation, if alien, and then leave it to the head of the Immigration Bureau as a court?—A. I think that while the consul-general resides here he be made head of this court.

EXHIBIT C.

AFFIDAVIT OF MR. CLEVELAND L. DAM.

Mr. Cleveland L. Dam, attorney at law, of the city and county of San Francisco, State of California, appeared personally before Special Agent Thomas F. Turner, and in reply to inquiries propounded, testified as follows, to wit:

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

Cleveland L. Dam, being duly sworn, deposes and says: From April, 1895, until October, 1899, I served as deputy labor commissioner of the bureau of labor statistics of the State of California, under the appointment of His Excellency James H. Budd, governor.

Among the first questions considered by the commission was that of the immigration of Japanese. The labor commission made as thorough an investigation as possible, the scenes of investigation being the city of San Francisco, Pleasanton, Vacaville, Solano County, and Sacramento. At Pleasanton we examined Japanese contractors and laborers, merchants from whom the Japanese contractors bought supplies, farmers, and the president of the Pleasanton hop fields; at Vacaville, the orchardists, boarding-house keepers, and Japanese contractors and laborers. The investigation in San Francisco covered the testimony of Japanese boarding-house keepers, officials connected with the United States Immigration Bureau at San Francisco, and merchants who were interested in the production of raisins, hops, and sugar beets in various parts of the State.

As a result of the investigation we could not find any specific contracts between persons of this State and the residents of Japan, but in one particular instance we traced a certain Japanese laborer from Winters, Cal., to his home in Japan, and his return with a number of workmen whom he brought here under his charge and for whom he found employment in the fruit orchards near Vacaville.

We also found evidence and had in our possession certificates of a society having its headquarters in Japan which issued to each emigrant a certificate promising to take care of them while in this country, to find them employment here, to protect them in case of sickness, and to exercise a general supervision over their future welfare.

While we could not find any evidence of existing contracts under which Japanese laborers were brought here, we were satisfied that they were brought here through correspondence with their friends in this country, who held out to them great inducements as far as employment was concerned, and the lucrative pay for that employment. The greatest difficulty had in making these investigations was the proneness of the Japanese to evade the truth. In interrogating them as to why they came here they would at first have nothing to say and then admit that they came here to learn, coming as students, but coming here to work until they had sufficient means to complete their education and study American ways and enterprises.

There are no doubts in my mind but that contracts are made in violation of the laws, but they are possibly made by the boarding-house keeper, who would contract to furnish so much help and rely upon the inducements of the person requiring same to send to Japan and get the men here.

Personally the Japanese laborer who comes here is unreliable and uncertain, and the success that has been attained by Japanese labor in this country has been done by what is known as the "Boarding-house system," where a number of Japanese can always be had. While some are sleeping off the effects of the night's intoxication, others always take their places, so that one need not be without any number of them at all times. This is one of the points relied upon as an excuse for hiring Japanese labor; that under this "boss system" the required number of men could always be had to perform the work, and under these conditions the employer is relieved of the trouble of seeking new hands from day to day.

The evolution of the Japanese is remarkable; after being here a short time and working upon farms, vineyards, etc., he gravitates to the city and seeks some employment of an industrial character which tends to displace mechanics, and in all parts of the city can be seen tailoring, furniture, shoe, restaurant, crockery, and other establishments, showing that the tendency of the Japanese is to engage in profitable employment to the detriment of white labor.

In domestic employment Japanese labor is becoming a very important factor, and to a large extent is taking the place of the diminished number of Chinese domestics, their work, however, not being as satisfactory as that of other domestic help owing to their unreliability.

The influx of Japanese can not be considered otherwise than a serious menace to the welfare of white labor in our State, not only as a competitor of the cheaper class of labor, but of more advanced labor, even to professional spheres, as is now evidenced by his signs and advertisements as physicians, dentists, and even fortune tellers, catering to white trade.

The Japanese stops at nothing, evidently imbued with the idea that he represents a superior civilization; he is here to turn his efforts to profitable account in an open field of competition comprising all avocations.

As he has driven white labor from the orchard, farm, vineyard, beet, and hop fields, and domestic services, there is no limit to which he will not aspire, and the result which must necessarily follow will be a most severe damage to white labor.

C. L. DAM.

Subscribed and sworn to before me this 16th day of February, 1900.

JAMES MASON,
Notary Public in and for the City and County of San Francisco,
State of California.

EXHIBIT D.

STATEMENT OF J. ENDICOTT GARDNER, OF SAN FRANCISCO, CAL.

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

Personally appeared before the undersigned authority in the above city, county, and State, Dr. J. Endicott Gardner, 37 years of age, and resident of the said city and county, at present occupying the position of United States Chinese inspector and interpreter at the port of San Francisco and professor of Chinese language at the University of California, and missionary.

Q. For how many years were you a resident of China?—A. Sixteen or seventeen.

Q. How was your time occupied during your residence in China?—A. As student in China.

Q. How long have you been connected with the Chinese bureau in the United States?—A. On the Pacific coast 16 or 17 years, from San Francisco to British Columbia, and for short periods at Portland, Port Townsend, Tacoma, Victoria, and Vancouver.

Q. As interpreter it has been your duty, has it not, Doctor, to interrogate Chinese emigrants who desire landing in this country?—A. Yes; both to interrogate and interpret interrogatories put to them by other inspectors.

Q. How extensive can you say your acquaintance and knowledge has been respecting the question, generally, of Chinese immigration and the methods and practices employed in securing admission to this country?—A. Probably on account of being able to read their letters, as well as speaking their language from childhood, I must say that I am as thoroughly familiar with those methods as anyone in California. I have been in the position to be more familiar than anyone else.

Q. What do you say as to whether or not the mode of procedure practiced now at the different Pacific ports is uniform?—A. There is a decided lack of uniformity.

Q. In a general way, can you state what has been and what is the effect of this want of uniformity in the mode of procedure and practice?—A. It leads to serious dissatisfaction on the part of the steamship companies, on account of the difficulty at some ports for the Chinese to gain admission, the collectors and officials being more severe and prejudiced, and causing the Chinese to make for ports where admission is gained more easily.

Q. It is a fact, then, that under the present practice and mode of procedure it is more difficult for emigrants at certain ports to gain admission than at others, and it is also a fact that those ports are chosen by the emigrants where they are likely to meet with the least obstruction. This situation, then, you attribute to the lack of uniformity?—A. Yes.

Q. What suggestion could you make that would tend to cure this evil?—A. I would suggest the gathering of data at different points where Chinese enter the United States and have them compared by special agents or with the commission, with the view to bringing about uniformity, so that all collectors, deputy collectors, and Chinese inspectors might act along certain lines. As things are at present, when certain steamship companies find it difficult to get their patrons in the officer at that certain port is made to bear the brunt of all this, and the most honest officer is held up for it.

Q. How long have you been attached to the bureau at this port?—A. I was attached to this bureau first either in 1883 or 1884 until toward the end of 1884. I resigned to go North for a more lucrative post, and returned to this coast when the salary was increased some three years ago, and in the meantime, off and on, I have been in the employ of the United States Government, all the time interpreting and translating between Americans and Chinese.

Q. What do you know, Dr. Gardner, upon the subject of railway and steamship companies being interested in bringing in these Chinese emigrants, and what part do they take in it?—A. So far as the companies themselves are concerned my present knowledge of them enables me to say only that they act in the capacity of being public carriers and wish only as few obstacles as possible to be put in the way of their patrons. I know of only one agent in particular who is directly interested in the coming of Chinese emigrants and furthers their coming to the United States. He is still in the employ of the Pacific Mail Steamship Company and his name is Soo Hoo Fong; and this man now in the employ of the Pacific Mail Company is engaged and has been engaged in furthering Chinese emigrants in coming to this country.

Q. What do you know of the subject generally of men of this kind organizing companies to bring in laborers illegally?—A. I know of some who are banded together for the purpose of aiding Chinese in illegal entrance into the United States; I know that they make that their business. These men are well known to the Chinese community, so well known, and they themselves are so well known, and their business so well known, that they have actually had a word coined for themselves, which is "Bahn Gar," which means "a Chinaman or Chinese who are in the business of importing Chinese coolies or Chinese slaves."

Q. What part, if any, do the highbinders take in promoting this illegal immigration?—A. They furnish false witnesses and frighten off anyone who might feel justified in coming forth and telling the truth.

Q. What do you know, in a general way, about the highbinders, their organizations, etc.?—A. In general they are organized societies for the purpose of committing crime. They exist on blackmail, on pay for protecting gambling houses and disreputable places in general. I know that they take it upon themselves to try cases, to review judgments of our courts with utter disregard for our laws. I know that they nullify our decisions. For instance, if an American court had rendered a decision, they would intimidate the witnesses so that when the cases go into a higher court everything would be changed. They defy our courts by ways and means of their own. I know that they impose their own sentences upon offenders from their own standpoint. They levy fines in some cases and death in others. I know they have in their service paid men to do the killing, and so long have they had this service that the men have a particular name; they are called "hatchet men." I know they control our judicial oaths; that they can say an oath shall or shall not be taken. I know them as organized societies of crime. They distribute revolvers to their members and send them out, and I have noticed in several cases where the revolvers were taken back. Such a notice is now in the possession of Captain Biggy.

Q. It is a fact, Doctor, is it not, that your life has been threatened by these highbinders?—A. Yes. I know they use our courts, if necessary, to enforce their decisions.

Q. In what manner?—A. By laying a charge against a certain Chinaman and having our judge pronounce the sentence. I know that these highbinders furnish

witnesses for anything wanted at so much a head. I have had cases in which men have come forward to testify, and when the time came they were spirited away. I know that the headquarters of these societies are in San Francisco, but they have branches in Canada. There are many active members who are able to do a great deal of injury, although many members have joined from fear.

Q. Do you say that these societies named are at all times employed in bringing Chinese labor into this country illegally, and is this a part of their business?—A. It has become a part since the act went into effect.

Q. What proportion of the frauds committed at the present time against the exclusion law could, in your opinion, be traced direct to these organizations?—A. At least 75 per cent.

Q. If some method might be devised whereby the community might be rid of the highbinder organizations, would it then have an effect?—A. It would, decidedly.

Q. How many highbinders of this criminal type would you say are in the city of San Francisco?—A. Speaking approximately, I would say that there are as many as from 1,500 to 2,000.

Q. What proportion of them are alien and what proportion native born?—A. I should not think there are more than 100 or 200 native born, and the rank and file of the population, in my opinion, are aliens.

Q. What do you think would be the effect of such a law, if passed, providing for the deportation of all aliens if found members of such societies?—A. It would break them all up.

Q. What is your opinion of the feasibility of such a law?—A. I think it could be done.

Q. Do you think that deportation is practically the only remedy?—A. Yes.

Q. In a general way, will you state why the Federal and municipal authorities are unable to break up these organizations, or to detect the offender when crime is committed?—A. Because the highbinders furnish witnesses, and terrify witnesses that the State may rely upon.

Q. What would be the result if some honest Chinaman would take the stand and give testimony against him?—A. He would be liable to forfeit his life for it.

Q. And it is the fear of this result which makes it impossible to enforce our laws against them, is it not?—A. That is right.

Q. What part is taken by attorneys in assisting in the illegal landing of Chinese laborers?—A. As it were, the Chinese prepare the cannon balls, and the lawyers fire them.

Q. Are any attorneys regularly employed by these Chinese highbinder societies?—A. Yes; and who have very little legitimate business besides.

Q. What class of lawyers, and about how many of them, are there engaged in this class of business?—A. As a rule, they are of a low grade. Roughly speaking, there are about one dozen in San Francisco.

Q. Do they have any other practice to speak of?—A. Very little.

Q. What do you know as to who compensates these attorneys in this case?—A. As a rule, the middlemen who are allied with the highbinders. These middlemen collect the fees and pay the attorneys.

Q. What fees do these attorneys receive, as a rule?—A. From \$25 to \$50 for men, and from \$100 to \$500 for women.

Q. What, in your opinion, would be the effect of a law which would limit the amount of fees or fix a maximum fee which an attorney might charge in all such cases; fixing it at a reasonable amount to the actual and legitimate service rendered?—A. If it can be enforced, and no collecting on the side is done, it would have a very wholesome effect.

Q. What have you to say as to the suggestion that the entire business of the Chinese bureau be transferred from the customs bureau to the immigration bureau?—A. I think very well of it, and think that is where it properly belongs. The reasons are that the very nature of the Chinese business brings it under the head of immigration, and the collector has no officers under him whose duty it is to enforce the Chinese restriction act.

Q. Do you not think that it would be well to enlarge somewhat the power of the inspector of the Chinese bureau to the end that in addition to his present power he might in cases generally have the right of reviewing contested cases?—A. I think well of it. In that connection I would say that the power might be given to a number of inspectors acting collectively as members of a board; then a decision would be given openly.

Q. In what class of Chinese emigrants are the greater amount of frauds committed at present?—A. The so-called Native Sons.

Q. About what percentage of these so-called Native Sons come under fraudulent

representations?—A. A very conservative estimate would be about 90 per cent.

Q. Could you suggest any method of procedure or practice which would tend to reduce this?—A. The improvements of the last bill passed requiring white witnesses and also record of birth in our courts.

Q. Your acquaintance, I notice, is very extensive among the upper class of merchants in this city?—A. Yes.

Q. If Congress were to enact a law for the breaking up of these organizations, do you think that the cooperation of these better Chinese could be secured?—A. I think that all we could get from them would be moral support and secret assistance out of fear for the highbinders. That it would meet with approval there is no doubt. The class next to the so-called Native Sons, where there is a large amount of fraud, is that of men who come representing themselves as merchants and who everyone can see are laborers and have every appearance of being laborers and sons of toil. I think our Government ought to have officers in the principal ports of China to cooperate with the Chinese consuls. We should have strict investigation at both ends.

JOHN ENDICOTT GARDNER.

Subscribed and sworn to before the undersigned this February 23, 1900.

C. L. DUNN, *Notary Public*.

[Exhibits attached to statement of J. Endicott Gardner.]

LETTER OF INSTRUCTIONS TO A HIGHBINDER OR SALARIED SOLDIER.

To LUM HIP, *salaried soldier*:

It has been said that to plan schemes and devise methods and to hold the seal is the work of the literary class, while to oppose foes, fight battles, and plant firm government is the work of the military.

Now, this tong appoints salaried soldiers, to be ready to protect ourselves and assist others. This is our object.

All, therefore, who undertake the military service of this tong must obey orders and without orders you must not dare to act. If any of our brethren are suddenly molested it will be necessary for you to act with resolute will.

You shall always work to the interest of the tong and never make your office a means of private revenge.

When orders are given you shall advance valiantly to your assigned task. Never shrink or turn your back upon the battlefield.

When a ship arrives in port with prostitutes on board and the grand master issues an order for you to go down and receive them you must be punctual and use all your ability for the good of the Commonwealth (or State).

If in the discharge of your duty you are slain we will undertake to pay \$500 sympathy money to your friends.

If you are wounded a doctor will be engaged to heal your wounds, and if you are laid up for any length of time you will receive \$10 per month.

If you are maimed for life and incapacitated for work \$250 shall be paid to you and a subscription taken to defray costs of your journey home to China.

This paper is given as proof, as word of mouth may not be believed.

Furthermore, whenever you exert your strength to kill or wound enemies of this tong, and in so doing you are arrested and imprisoned, \$100 per year shall be paid to your friends during your imprisonment.

Dated 13th day of 5th month of 14th year Kwong Sui, Victoria, B. C.

[Seal of Chee Kong Tong.]

TRANSLATION OF A BILL OF SALE DRAWN UP IN THE GUISE OF A PROMISSORY NOTE.

I, Ah Kam, being poor and not having anyone on whom to depend, make this agreement, by which to obtain \$400 with my person. The middle party in this transaction, Loui Fung, having introduced me to Lang Kui, and having the promise of the latter to pay this debt for me, besides passage money and other expenses, we three are agreed, and to-day the transaction has taken place; not a cent now is owing to Loui Fung. The money having actually changed hands, first into the hands of myself, Ah Kam, and I am this day handed over to Lung Kai, to be taken to California for immoral purposes. The time of service is agreed to be four and one-half years with no pay for the service on the one hand and no interest

for the money on the other. Fourteen days of sickness will not be taken notice of, but fifteen days of sickness will have to be made up by serving an additional month. In case of pregnancy an additional year has to be served. As to any expected calamities happening that may happen to anyone, that will be left to the decree of heaven. Should I upon arrival at California attempt to escape, or should refuse to be a prostitute, I agree irrevocably that Lung Kai should sell me to another at pleasure. Lest word of month should not be proof, this instrument is drawn up to be such.

Kwong Sui 17th year, 9th month, 1st day (Oct. 1st, 1890).

AH KAM (her mark).

TRANSLATION OF CATECHISM USED IN THE COACHING OF WITNESSES FOR THE
LANDING OF A CHINESE SLAVE GIRL.¹

[Translated by Jno. Endicott Gardner.]

What is your name?—Wong Fook Sing.
How old are you?—61.
How long have you been in the United States?—29 years.
What boat did you take?—Took steamer.
What year, month, and day you came to the United States?—Tung Chi 9th year, 6th month (about July, 1870).
What do you do for a living?—I am at present salesman for Chung Kee & Co., 1107 Dupont street.
What is your occupation?—Working as salesman.
How long have you been with Chung Kee?—4 years.
What is your wife's name?—She was a Miss Lam.
How old is your wife?—47.
Is your wife natural footed or small?—Natural.
Where were you married?—San Francisco.
What year, month, and day were you married?—Kwong Sui 2d year, 5th month, and 1st day. (1876, about June 1.)
How long have you been married?—22 years.
Where is your wife?—In Canton, China.
How many children have you?—Only a girl and no boy.
What is your daughter's name?—Wong Sing You.
How old is your daughter?—23 years old.
Where was your daughter born?—Dupont street, No. 938, third floor.
What year, month, and day was your daughter born?—Kwong Sui 4th year, 6th month, and 1st day. (About July 1, 1878.)
How old was your daughter when she returned to China?—4 years.
What year and month and by what boat did your daughter return to China?—Kwong Sui 7th year, 10th month, 2d day. (About November 2d, 1891.) By Rio.
With whom did your daughter go home to China?—With my wife, who was Miss Lam.
Where did your wife and daughter live after their return to China?—Thirteenth ward, on a straight street.
Is your house in China brick or wood?—Brick.
How many rooms in your house?—One room and one kitchen.
Is there an upstairs in your house?—Yes; it has one room, a bedroom.
Do you recognize your daughter?—Yes.
Have you seen your daughter since her arrival?—Yes.
Did your daughter send over to you her photograph?—My wife this year, 2d month (about March), sent me our daughter's photograph.
Did your daughter write you?—No; only my wife.
Who sent your daughter home?—I did.
Did you ever write to your daughter?—No; only to my wife.
Did you ever send money home?—Yes, the 2d month of this year I sent \$200 Mexican by Young Ming to my wife.
What was your former business?—Tinware.
How long were you engaged in that business?—In the tinware store— (Answer incomplete.)
On what street and under what name was your business?—On Washington street, No. 745, in the basement; named Gung Lung; tinware business.

¹ Upon the discovery of the catechism the slave was denied landing by Collector Jackson.

Were you ever back to China?—Kwong Sui 11th year, 10th month. was back. (About October, 1886.)

By what route did you return to China?—By the Portland route.

When you wrote to your daughter to come back did your wife answer the letter?—No.

When did your wife ever write to you?—Afterwards, when she announced that a daughter would be coming over.

Where is your letter now?—Burned up after reading it.

What is your daughter coming back for?—To be married.

Have you brothers or sisters?—No.

Has your wife any brothers?—No.

Where are your parents now?—Dead.

How long have they been dead?—Over twenty years.

What are your parents' name?—Father, Kwong Fook Sun; mother, of the Chun family.

Where are your parents-in-law?—Dead.

How long have your parents-in-law been dead?—27 or 28 years.

What are the names of your parents-in-law?—Lam Ping the name of the father, and Ho the maiden name of the mother.

Did you send any money home this year?—This year in the 3d month I sent \$100, Mexican.

How did you send it?—I asked a friend to take it back.

What is that friend's name?—Yeung Ming.

Is your friend back in this country?—He is still in China; he did not return.

How long have you known Chan Chun?—20 years.

Where is he now in business?—Dupont street, No. 1107; Japanese ware business: he is the proprietor.

Where did you become acquainted with him?—On Pacific street, in the Chun Kee cigar store.

Has he ever been back to China?—No.

When your daughter was a month old, did you invite him to the feast?—I did.

Where have you known him?—On Pacific street, No. 741, in the Chun Kee store.

Have you a photograph of yourself at home?—Yes.

Madam Choy and Chan Yeung are notorious importers of female slaves, associates of Little Pete.—(Note by the interpreter.)

TRANSLATION OF THE PORTLAND SKETCH.

Starting from San Francisco, you go to Portland, taking the boat at the China Mail dock, (this was corrected and "Spear street" was substituted.—Note by translator), the boat starting at 10 o'clock in the morning. Time from here to Portland, 3 days and 2 nights; fare \$10. You first get to Astoria and then to Portland. Chinese in Portland are on Second street. The fare from Portland was \$48.

(Here follows diagram of the route.)

VOLUNTARY STATEMENT OF LEE YOW CHUN.

PRESBYTERIAN MISSION HOME, *January 17, 1898.*

My name is Lee Yow Chun. I am a native of the Sha Tow village, in the district of Ho Nam, opposite the city of Canton. I have never before been in the United States. I am 16 years old. I reported my age as 20 upon my arrival; that my name was Lee Choy Wan, and that my birthplace was San Francisco. Because we were poor my parents removed to Hongkong, where they could get better wages. My father, whose name was Lee Tsung, died in Hongkong when I was 13. After father's death mother continued to work as household servant. At Hongkong we

lived on Kow Yu Fong street. My mother's name is Lum Ah Mui. She is 40 this year. She worked on Kwok Lun street, No. 31. This is where she was working up to my leaving Hongkong. Mother told me one day that a go-between had been to see her on behalf of a wealthy Chinese merchant living in San Francisco, who wanted a wife from China; that she wanted me to go out and take a walk, so that I could be viewed by the go-between, that she could make her report. I did what I was bid, though I knew that mother told me this with some misgiving, as she had declined the offer once and would decline again but for her good nature and her poverty. The go-between having made her a present of \$380 as coming from my intended husband, mother said she consented to take so little because I could only marry that merchant as a concubine and also that in 2 or 3 years I could come back to pay her a visit. About a week after, toward evening of the 3d of the 11th month (November 25, 1897), a man whom I had never seen before nor since, and whose name even I do not know, came to our house and took me to a house on a street next to Kwok Lung street. In this house were several women who said they had been to the United States. My mother wanted to accompany me to that house, and I wanted her to go along too, but the man said since we had to part anyway we might as well part then, so that I would not feel so bad when the time came to go on board. So we parted then and there.

When this man had me in that house he took me to a room, after my hair had been dressed, and with no other in the room brought a piece of paper out of which he taught me certain things I was to say when questioned by the customs officer in San Francisco. When he told me what to say in answer to their question "What is your father's name?" I said, "What does that mean. My father has been dead some years." He said, "We have to do that, as that is the law in California. You can not go there to get married unless you follow my instructions." I then listened until he got through with a list of questions and answers. After I had learned my lesson dinner was served, and about 8 o'clock in the evening I was taken down to the water front, where a little boat was in waiting. I was taken on this little boat and the boat people rowed me out alongside steamer *China*, where we passed the night. At 4 o'clock in the morning, when it was yet dark, I was told to go quietly over to the *China*. Shortly after the *China* started for California. I found 8 other girls on board, with 8 more after we left Shanghai. As I was told that my landing depended upon my remembering my story, I went over it every day from the day we started, at times singing it as we would a song, though often weeping as I sang, whenever I thought of mother and of home.

The Chinaman in Hongkong let me have the paper to learn the story from, telling me that when I got its contents well committed to memory I was to throw the paper overboard. The paper was about 18 inches long. I saw that the other girls each had a story to learn also. A day after our arrival at San Francisco we were questioned by the customs officers. I answered as I was told to do by that man in Hongkong. Three or four days after I was told someone was inquiring for me. He pointed to himself and said very hurriedly: "Take a good look at me, so that you can recognize me afterwards as your father." No sooner had he said this than he hurried off to go. I called after him, saying "I could not recognize a person as my father upon seeing him so short a time." He then came back and stood by the vessel a little longer. A pit-marked woman accompanied him. This woman I soon found to be a procuress. This, together with a caution that my mother gave me, as well as some things that the sailors were good enough to tell me, convinced me that all was not right. Several times I told the customs officers, through one of the male passengers as interpreter, that I did not want to be landed. Another girl was of the same mind as myself. Somehow the importers of the girls found out that we did not want to be landed, and some of them came down to frighten us, saying we would be imprisoned at least 5 months before being sent back, and then we could only go as far as Japan, when we would be taken possession of again. This did not swerve us from the course we decided on. When word came from the collector that I could land, not being able to do anything else I fell in a lump on the floor and cried loudly, saying I did not want to be landed by those people; that I would jump into the sea rather than be taken by them. Somehow the fact I cried reached the ears of the official interpreter, who came with another officer and quieted me. Soon after they returned and said the collector had allowed me to go to a rescue home and there to remain until the next returning boat to China.

I am now in that home, happy and contented, enjoying the prospect of soon being restored to my mother.

TRANSLATION OF AN INTERCEPTED LETTER FROM A HIGHBINDER TO THE OFFICERS OF THE CHEE KONG TONG SOCIETY, ONE OF THE LARGEST, IF NOT THE LARGEST, HIGHBINDER SOCIETIES IN THE UNITED STATES.

[Translated by Jno. Endicott Gardner.]

To the officers of the Chee Kong Tong Society.

GENTLEMEN: On the 5th instant Lee Shan came by stage to our store and said that the Chee Kong Tong had deputed him to come here and collect from Chan Tsung, Lieu Ming Chew, and Chew Keuk Min (the last named a woman.—Note by translator). He passed the night in our store. The next day he started out. He then stopped with Szlo Kam until the night of the 10th. Soon after it had turned 1 o'clock Chew Keuk Min died. On the 12th there were certain townsmen of ours who reported that Chew Keuk Min was killed by Lee Shan. Now they are going to arrest Lee Shan. To-day Sz Lo Kam was taken into custody. The trial, however, is not yet commenced. To-day the different brethren held a consultation and decided they would require Lee Shan to make up the sum of \$200 for funeral expenses; that they would not be satisfied unless he did make up that amount. How this affair is going to end I don't know. It evidently is going to be quite serious. We hope in some way you brethren will contrive to save him somehow. This is the most important thing to do just now. Furthermore, we have no able person here to attend to the matter. The authorities into custody and yet no trial has taken place. The young woman, when pressed by the authorities, positively identified Lee Shan as the guilty man. We hope you will soon send us word.

Yours, respectfully,

LEE YUET.

JANUARY 21, 1899.

TRANSLATION OF ONE OF THE LETTERS OF WARNING AGAINST HIGHBINDERS SENT TO MR. J. E. GARDNER, NOW OFFICIAL INTERPRETER FOR THE CUSTOMS AT SAN FRANCISCO.

TO MR. JOHN GARDNER.

DEAR SIR: There is a saying that the good will early be within angelic bounds, while the evil will assuredly be punished, while the latter kind would not be long tolerated by heaven. I have long heard of your name in Victoria in connection with the rescue work. Engaging in this good work you of course benefit people. It seems so strange that now there should be one, Lo Tsun, even for a bad man, who has told me, Leung Tsun, to injure you some way, offering as a reward \$100. You have done me no harm. How could I bring harm to you. What I am afraid of now is that, with me not willing to injure you, he would find some one else who would be willing. I shall just appear willing. In point of fact, I shall not do anything. I send you word early, so that you may be cautious as you go in or out in order that others may not harm you in some unexpected way. I have long known of your doing good all the time. That is the reason why I am so bold in speaking of this matter as I do. Be sure not to let this go out for fear Lo Tsun should have a design on me for it. It is hard to describe all his wicked ways. Be careful; that is all.

Respectfully, yours,

LEUNG TSUN.

APRIL 2.

EXHIBIT D.

STATEMENT MADE BY LIEUTENANT OF POLICE WILLIAM PRICE TO COMMISSIONER OF IMMIGRATION HART H. NORTH, AT SAN FRANCISCO, CAL., SEPTEMBER 22, 1898.

[Questions put by Commissioner North and answered by Lieutenant Price.]

Q. Lieutenant Price, Chief Lees, the head of the police force of this city, has stated to me that you are probably as well posted as any man here connected with the police force on the subject of so-called Chinese highbinder societies in their various phases, including, among others, the opinion in which they are held by the respectable Chinese element in this city; and in order to get a coherent statement I will start in by asking you how long you have been on the police force in this city.—A. 21 years.

Q. How much of that time have you spent in the Chinatown district?—A. About 2 years, off and on.

Q. Aside from the time that you have been acting as policeman in Chinatown, I suppose, through your connection with the police force, you have known pretty well what has been going on?—A. Oh, yes; all the time. At the time I speak of I had entire charge of the Chinatown squad.

Q. You were at the head of the raids that were conducted under the order of Chief Crowley some 5 or 6 years ago, were you not?—A. Yes.

Q. At that time you demolished the headquarters of a large number of highbinder societies, did you not?—A. 26 societies.

Q. Did that include the headquarters of the Chee Kung Tong?—A. That is the original of all the tongs or societies—what they call among the Chinese the Freemason Society.

Q. Are you a Mason yourself?—A. Yes.

Q. As a matter of fact, the society has no resemblance to our Freemasonry, has it?—A. I have found members in that society, lately it has had Chinese members.

Q. Do they acquire this knowledge through this society, or not?—A. Not through the Chee Kung Tong.

Q. You believe, though, in China or somewhere else, there is a society that resembles in some respects the Freemasonry in the civilized world?—A. Yes.

Q. The Chee Kung Tong is also known as the Triad Society, is it not?—A. Yes.

Q. Are all the other societies offshoots from this society?—A. Yes; the same as other societies organized here and having branches in other places.

Q. What is the purpose of organizing these societies? Are they all organized for the same purpose, or some for one purpose and some for another?—A. All the Chinese highbinder societies are organized for the purpose of murder.

Q. From what do they derive their chief sources of revenue?—A. Through means of blackmail and houses of prostitution.

Q. Do they conduct gambling houses themselves?—A. Yes.

Q. That would be a third source of revenue?—A. Yes.

Q. Are the majority of frequenters of gambling houses in Chinatown members of the highbinder societies?—A. A great many merchants have come to me in the middle of the night to give me information concerning these gambling houses. These merchants are obliged to belong to these societies for the sake of protection; they can not get out of it. Although belonging to the societies, they are always willing to furnish me with information to aid in my breaking them up, but they would not be seen speaking to me on the street.

Q. They are members of the highbinder societies in fact, but not in spirit?—A. Yes; that is the case.

Q. That, I suppose, applies to the majority of the members of the highbinder societies, does it not?—A. Not to the majority, but to a good many of the merchants.

Q. How do they conduct their blackmailing operations?—A. They hire places similar to this office and have their names printed on signboards and hung outside, such as Chee Kung Tong, Suey On Tong, Bow Sing Suey Tong, Suey Sing Tong, Hop Sing Tong, Suey Dong Tong, etc.

Q. Do you know whether all these societies have branches in other cities of the United States?—A. That, of course, I do not know positively; I have only heard of them. I believe there are branches of these societies in Los Angeles, San Jose, and throughout the East—Chicago, New York, etc.

Q. I am told that the Suey Sing, Hop Sing, and Chee Kung tongs have branches in the principal cities of the United States.—A. They have them wherever there is any number of Chinese.

Q. You were telling about the rooms or offices fitted up by these societies.—A. Their places are finely fitted up, the same as clubrooms. There they meet as other organizations do. If the member has anything against another man he places his case before the society and offers so much money to have the man killed. After they have settled on the man to be killed, his head is as good as gone. They hold a meeting and have something filled with balls, buttons, or beans, or something of that sort. The men are blindfolded and draw. If one draws the certain amount, he is chosen to do the killing. Sometimes there are 2 or 3 chosen, generally 2. As soon as they draw those balls they are in the same fix as a man to be hung. The society's rules are so binding that those chosen are bound to kill that man if there are 20 policemen about when he meets him.

Q. These men who draw the lot go out and hunt up the victim and kill him wherever he may be found?—A. According to the rules of the society, they then go and fix up whatever little business they have, the same as a white man would make his will before going on a journey. Then they go out and hunt their victim. According to their rules, the society hires an attorney for the murderer to defend

him in the courts, and does everything possible to aid in his acquittal, furnishing witness, etc. Perhaps the murderer is caught, arrested, tried, and sentenced to death, and executed; then the society has to pay so much money to the relatives in China. If the man is hanged they will probably pay his relatives \$500; if he is imprisoned for life, \$250; if imprisoned for a shorter time, \$100. And this is the same in every case that is brought before the society.

Q. Do you know how much a member of the society pays, as a rule, for having a man killed?—A. All the society can get from him; no certain amount. Some people are willing to pay more and some less. Little Pete, who was killed, was wealthy, and there was about \$3,000 or \$4,000 on his head.

Q. His enemies had offered that to anybody who would kill him?—A. He was a Sam Yup. The Sam Yups are what you call the aristocracy. There is only 1 Sam Yup to every 15 See Yups. The See Yups are small merchants here, keep laundries, and are people of that class. The Sam Yups own large stores.

Q. They are regularly organized, the Sam Yups and the See Yups, are they not? And are they members of those tongs?—A. Of course they have members in those tongs. They are from different provinces in China—two clans, as it were, the same as in Scotland or England. All these people claim to be cousins.

Q. These classes fight, then, among themselves, do they?—A. They fight all the time. There has been a boycott for 4 or 5 years to prevent a See Yup buying from a Sam Yup, and vice versa. If a See Yup is found buying from a Sam Yup he is taken in the street, his purchase taken from him; he is then conducted to one of these societies and is fined \$2, and probably gets a good thrashing besides. Every time a man is brought up the arresting officer of the highbinder society gets \$2, so they are very vigilant in consequence.

Q. Little Pete belonged to the Sam Yups, and was one of the richest Chinamen in town, was he not?—A. Not one of the richest, but very rich.

Q. He was supposed to be killed at the instigation of Big Jim, was he not?—A. No; Big Jim was also a Sam Yup.

Q. Why was it that Little Pete was killed? Was it at the instigation of the Sam Yups or the See Yups?—A. The See Yups.

Q. What had he done to the See Yups?—A. Of course, as I say, there are two factions that are all the time fighting. Little Pete was a very intelligent Chinaman, and they accused him of informing the police, on account of raids made by them—which he did, as a matter of fact.

Q. And accordingly there was a price put upon his head?—A. Yes.

Q. He was accompanied by a bodyguard for a great many years, was he not?—A. Oh, yes.

Q. By Lee Chuck, a highbinder, was he not?—A. Yes.

Q. Lee Chuck murdered somebody and was sent to State prison, and Little Pete got somebody else to act as a bodyguard, did he not?—A. He had 4 or 5, at least—3 Chinamen and 2 white men. About 7 o'clock one evening Little Pete came downstairs accompanied by a white man of his bodyguard. Little Pete kept a shoe shop. He entered the barber shop and told his bodyguard (the white man) to go down to the corner of Kearny and Washington streets and get him an evening paper. He sat down on a chair. Chinamen had been watching him, and he was no sooner seated than they came right into the barber shop and shot him.

Q. Did they convict these men?—A. They never got the right parties; I was told that the parties that did the killing went to China on the next steamer.

Q. This is only a fair sample of highbinder methods, is it not?—A. That is an idea of the whole business.

Q. Big Jim was a notorious gambler here for many years, was he not, and was chased out of the city by the See Yup faction?—A. Yes.

Q. He went to China and is there yet and afraid to return, is he not?—A. Yes. You see the merchants are so entirely under the control of these societies and are so dominated by fear that any demand that is made upon them they pay without question. I will tell you of an instance of this: There was a butcher on Washington street. One evening he threw out a little clean water on the street. A Chinese highbinder who was standing near by got the water on the sleeve of his coat. I happened to be there at the time, and when I had passed by, this highbinder went to the butcher and demanded \$100 for the offense and said that he would call again. I told the butcher not to pay that money, but to make an arrangement to meet him at a certain place and I would be there. He promised to do so, and would you believe it, before I got back there he had paid the highbinder the \$100. This is to show you that anything these highbinders demand they get.

Q. I suppose that the amount of revenue that the highbinder societies exact from these merchants is simply tremendous?—A. I would say that there are about 8,000 Chinese highbinders of this city just living in that way; they do not do anything for a living except levy blackmail.

Q. What do you suppose to be the total population in this city now?—A. About 35,000.

Q. And 3,000 of them are nothing but cutthroats and bad men?—A. The worst class of people on the face of the earth.

Q. They never interfere with white people, do they?—A. Not very often. The Chinese consul talks to them constantly on that point. They are afraid of an uprising of the white people against them, and that they would all be killed, and this fear keeps them from doing so.

Q. Do you know of any instance of their killing white people, or of their levying blackmail on white people?—A. Not very often do they attack white people, and only then when under the influence of liquor.

Q. These highbinders are very much given to securing perjured testimony, are they not?—A. It is an impossibility to rely on them. For instance, a man is killed; I am sent to investigate; a man is pointed out to me as the murderer, as positively identified as such, and I have positive evidence that that man was not within 5 blocks of the scene at the time of the murder. I arrested the man, as my duty as a public officer compelled me to do so, but I knew the man to have been in a shop on one street when the other man was murdered on another. However, when taken into court, it was proved that he was not the murderer and was acquitted, and afterwards the right party was secured.

Q. And they are also largely engaged in furnishing perjured testimony to aid in the landing of Chinese girls here, are they not?—A. Yes; one of the by-laws in all of these highbinder societies is to swear to aid in the landing of their people here, especially Chinese women.

Q. I have taken the statements of a number of rescued Chinese girls at the missions, and almost without exception they have told me horrible tales of cruelty inflicted upon these girls in these houses. Most of these girls claim to have seen the killing of some of their number, or to have seen the bodies after they have been killed.—A. I don't know much about the killing of these girls; they are too expensive to kill.

Q. Those who have been killed were generally old girls.—A. When they grow old they are usually placed as cooks. These girls are never seen on the street unless followed by an old hag who keeps the house. These girls are worth about \$3,000, and are too valuable to kill.

Q. They are absolute slaves, are they not?—A. Every single one of them.

Q. And were it not for the highbinder societies it would be impossible to keep them in such absolute slavery, would it not?—A. They could not do it at all. The highbinder societies derive their principal source of revenue from protecting these houses.

Q. Can you tell a highbinder from another Chinaman, when you see him? A. I can walk on the streets and pick them out and never make a mistake.

Q. How can you detect them from any other Chinaman?—A. They used to dress differently and wear their hair differently.

Q. Their hair is not so neatly kept—more fluffy—than other Chinamen, is it not?—A. That is right; at the end of the cue where it joins the hair; and then they used to wear different kinds of shoes and different kind of hats (round, stiff-brimmed hats). When they found that I had discovered their mode of dress, they stopped wearing what might designate them as highbinders. Then, again, in searching these men one would invariably find a little piece of red silk in his possession. On that silk was printed what society he was a member of, so that in case of death or accident he could be identified. Then they did away with that and we could not find anything to distinguish them.

Q. I have heard it rumored a good many times that the Chinese consul, the predecessor of the present incumbent, was obliged to leave the city, largely through the threats of the highbinder societies.—A. That is true. I used to know him well, and spent much time with him, seeking information concerning the workings of these societies, which he was always willing to give me. I do not remember his name. Mr. King, the vice-consul, also assisted me greatly in this work.

Q. Mr. Ho Yow is the present Chinese consul, is he not?—A. I do not know this one.

Q. What became of Mr. King?—A. He was also driven out of the city, through the firm of Reddy, Campbell & Metson, attorneys for the highbinder class in Chinatown. Riordan was the attorney for the Chinese consul and Six Companies. The consul-general and Vice-Consul King were always in favor of breaking up these societies, so the highbinder societies had them removed.

Q. Have you any idea as to what laws might be passed by the United States Government which would help to break up these societies?—A. When I was

first sent into the Chinatown district in 1888, things were in a very bad condition: there was hardly a day that someone was not killed, even white people, killed by accident, as shot was flying everywhere. One afternoon there were 75 shots fired on the street from one faction, directed toward another faction. I went to Chief Crowley and told him that I could do nothing; that there were no laws to cover these things. I said to him: "When any of these Chinamen commit deeds of violence they run into the numerous small alleys of Chinatown and get beyond our reach, and after being once lost sight of it is impossible to identify them, unless by some peculiar mark about him. These societies are unlawful and organized for unlawful purposes. They do not recognize our laws, and to compete with them, we have to go beyond our present laws; they are not sufficient. I can put a stop to these societies if you will give me my own way." He said: "I am under bonds here and of course they will sue me if I do as you suggest." I said, "All right." I saw the Chinese consul and he spoke to the chief of police, and also told me to use my own judgment, assuring the chief that if he should be sued, he (the consul), or the Chinese Government, would stand the consequences. The chief sent for me and said that he thought my ideas were all right and gave me permission to carry them out in my own way.

I then went out and got seven or eight strong, healthy officers, and we visited all these places, taking down the numbers and setting out in the right way to get into the workings of these societies. There are a great many different societies in Chinatown, some being organized for charitable purposes, benevolent societies as it were, and in order to be sure that I had the right places and did not make any mistakes, I took plenty of time and care, as I did not want to interfere with any but the genuine highbinder societies. When I had everything arranged I got 16 men in uniform and a surgeon, and supplied them all with axes. We marched from one to another of these societies and literally cut them to pieces; did not leave a bit of furniture 5 inches long in one of them. I suppose we broke up about \$180,000 worth of property. Some of these places were fixed up magnificently. Wherever we went we got arms, ammunition, bowie knives 2 feet long in blade, iron bars done up in braided cord, etc.; also chain and steel armor that they wear under their clothing, and which it is utterly impossible to penetrate.

Q. At that time any of the highbinders that you found in these rooms you kicked down stairs, did you not?—A. We did. Of course, by breaking up their meeting places they could not meet. Among the better class of Chinese who belonged to these societies through fear, or for self-protection, we were held in favor for what we had done. Everything they could do to aid me they did. They could not meet me in Chinatown, but came to my home in hacks at night to inform me where I could find these men. I was so well posted in the situation of Chinatown that they could not open their rooms or offices in any place. We broke up their josses—they always have josses in these places. One of them they brought from China and was worth from \$700 to \$800. I broke up one of these and the friendly Chinese were so superstitious that they feared I would die. One came to me and said he was very sorry; they liked me very much, but I would die in 3 days. One of my men caught cold and his eyes became inflamed. One of these men came to me and said "Soon he will be blind." Three days before the Chinese New Year I met this man and said to him "You see I am not dead yet." He said "New Year surely you die." New Year came and I was not dead, and he said they must get a new joss; that one had been no good.

At the Hop Sing Tong I gave them an hour to remove their fixings and prepare for our coming. This was a building four stories high, an immense place, and I suppose the building and furnishings cost \$30,000 or \$40,000, and perhaps \$100,000. This was owned by the highbinder society. They owned two or three such places, the property and all. I notified them that I would give them 3 hours to move their things out of the building. I went back in 3 hours, at 6 o'clock, and they had nothing moved. They saw I meant business and they tried to save the joss, which was very heavy. In moving it some of the old boards underneath creaked, and they went down those stairs like mad, thinking the joss had spoken; and if you had offered one of those men \$10,000 he would not go up those stairs again. There were 7 josses in one building and we tore the whole thing to pieces.

Q. The result of those forays was to disperse those highbinder societies, was it not?—A. It was done so that they would not have any meeting places. I went around to all the stores, houses of prostitution, and places of that kind in Chinatown and notified these people that if I found out that they were aiding these highbinder societies in any way, manner, or form, by giving them money, I would demolish their places. If they wanted protection, I would furnish it to them; if 1 officer would not do, we would give them 40, but if I found out that any of them

had paid any money to these societies I would break up everything they had. In this way several of the societies were driven out of town, and for about 3 years there was not a Chinaman killed in the city. I followed the thing up every day, and if a signboard was put up to denote the meeting place of one of these societies we would split it up in a thousand pieces. This was the means of disbanding them altogether; they then went to other cities. If this method had been kept up, we would not have this trouble at all.

The reason it was not kept up was because suit was commenced in the United States court against the chief of police and raiding officers and everybody who was concerned in these raids, was it not?—The attorneys for the Chinese high-binders raised a large amount of money to carry on these suits, and bothered the chief of police a great deal. It kept us going all the time; the cases were first conducted in our courts then taken to the United States courts. If these people were convicted as gamblers in the lower courts, they were taken into the United States courts and acquitted.

Q. Then in brief, you think that if some laws were passed whereby protection would be granted to the officers in their raids, and power given them to demolish these places as fast as they appeared, it would be the means of completely effacing these highbinder societies, do you not?—A. Yes. You see there are fully 3,000 people who have no visible means of support, and they belong to these societies and meet there for unlawful purposes. I should think there ought to be some law to rid the country of these people.

Q. I suppose if they could be deported if found to be highbinders, and sent back to China, this would have some effect?—A. If they were convicted as thieves and murderers they can be deported, but not otherwise.

Q. These highbinder tongs often fight amongst themselves, do they not?—A. They are fighting all the time among themselves. For instance if one tong is paid higher prices for his work than another; then there is trouble. Or, one tong will want all the patronage and tries to drive out the others. If they hold a meeting of the different societies and one side differs from the other, then the result is a fight between the two, and probably murder.

Q. I suppose, lieutenant, that you keep pretty well posted through the papers, and from information received at headquarters, in regard to the criminal doings in the United States of all kinds?—A. Yes.

Q. You are pretty well posted on the doing of the Clan Na Gael, Mafia, and so on. Now, do you think that any of these societies in the United States, in regard to the strength of organization, number of crimes, and the wealth of the society can in any way compare to the highbinder tongs in San Francisco?—A. Of course in these other societies there are not so many people congregated together as with the Chinese. You see they live all together and apart from the rest of the city.

Q. Is it not a fact that there are five murders among the Chinese to one murder by the Clan Na Gael or Mafia?—A. There are many murders among the Chinese that we have never heard of.

Q. As a rough estimate, since 1880, how many murders would you say have been committed by the highbinder societies in San Francisco?—A. I would say about 30 killed outright—shot down in the streets.

Q. Just tell me what you secured in the way of rules and regulations and other data in regard to the constitution and by-laws and so on.—A. It was a small book, about 1½ inches thick, square, with gilt edges, and illustrated. I took six of them, and did not understand thoroughly what they were, although I had an idea they were the by-laws, and when I got to the office of the chief of police they were eagerly seized. I went back to the place with 4 or 5 men, and from that day to this I have never been able to find another book. There were then about 400 of them.

Q. Were they all the same or different?—A. All the same.

Q. From what tong did you secure these books?—A. The Chee Kung Tong. I have searched Chinatown elsewhere, but have never found another book.

Q. You say there have been only 30 Chinamen killed in this city since 1880? I thought there had been more than that.—A. Of course there have been numbers of Chinamen killed in the houses and such places that we have known nothing about, but in the open streets there have been about 30 shot down alone.

Q. Those killed in the houses would amount to a much larger number, would they not?—A. Of course. One night about 11 o'clock I was on the corner of Spofford alley and Washington street, when the people were coming out of the Chinese theater. A shot was fired, and it struck a woman who was passing in the neck and lodged in the back of her teeth. The shot was intended for a woman, but if it was this one or not I do not know. The man who fired the shot was not more than 1 foot away from me, but there were 2 Chinamen in front of me and 2 or

more behind me, and the man turned so quickly and got away into some alley that I could not find him. The woman lived on Sacramento street, and I took her home. I never saw such a brave woman. The bullet was stuck on her back teeth and I pried it off. The doctor saved her, but her tongue was almost cut off. The doctor fixed her tongue as well as he could, and she lived.

Q. In that one battle, at the time you speak of, when there were 75 or 80 shots fired, were there not 5 or 6 men killed?—A. Two killed, 2 or 3 fatally wounded, and several others slightly injured.

Q. I remember reading of 5 or 6 killed at one time. Am I right about that?—A. Their shooting was so terribly wild that they did not kill themselves, but white people were not safe.

Q. They have a common habit, I understand, of carrying the pistol in the hand stuck up in their voluminous sleeve, and going up to a person and shooting him through the sleeve. Is that true?—A. They generally take out the pistol when they shoot, although they carry them very often in their sleeves. Highbinders seldom carry pistols. They are generally accompanied by another person, whom they call "jury," and who belongs to the poorer class of Chinamen. He follows the highbinder and carries the weapon. When caught, we would search the highbinder for a pistol, but would not find anything of the kind on him, and the "jury" would have disappeared with the weapon. The only time the highbinder has a weapon is while leaving his quarters, but on the street you will not find one.

Q. Are they not oftentimes called "hatchetmen"?—A. The hatchet is a great weapon and the blade is about 6 inches long.

Q. A regular cleaver?—A. A good deal like a lather's hatchet.

Q. When you said that there were 80 men killed in the streets, you meant men who were shot; that does not include men who were killed by hatchetmen, does it?—A. They do not use these hatchets very much now; they use knives more, because knives do not make any noise.

Q. At the time you speak of, a number were killed by hatchetmen and others by pistol shots, were they not?—A. They are found dead in the houses; most of them are never found and never will be. They bury themselves.

Q. Then the probabilities are that there have been a vast number of murders committed in Chinatown that have never been heard of?—A. They are the most cruel people in the world. Once I was on the corner of Washington and Dupont streets, about 6 o'clock in the evening. An old merchant came along and was approached by two of these hatchetmen. They at once struck him with the hatchet, driving the blade, 10 inches long, right into him. They knocked him down and continued to stick these things into him.

Q. You saw that yourself?—A. I was standing there looking at them. Just to show you, as I said before, how binding their laws are, they are obliged to kill their man whenever they met him, no matter who was about. I had 2 officers with me at the time and there were 2 more across the street in uniform (we did not usually wear uniform in Chinese quarters). Notwithstanding all this, the murderer walked deliberately out into the middle of the street, and, surrounded as he was by all those officers, when it was impossible for a man to escape, he killed his man. So you see he had no fear of us.

Q. Was he caught red-handed?—A. He had no possible chance for escape and he knew it, but wherever he met his man he was obliged to kill him.

Q. Rev. Mr. Masters has a suggestion that an auxiliary detective force, composed of Chinamen of the respectable class, would be a great aid to the regular police force in stopping the operations of the highbinder organizations. Do you think there is anything in that?—A. It might work if one could come across any Chinamen who are not in fear of these highbinder societies, but I have not found one yet. If you have Chinamen who are afraid to act they would be of no use. The Chinese have 6 men acting in that capacity now; some of them are exconvicts. They are of no use at all. They are supposed to give information concerning these highbinder societies, and they try to get evidence amongst the Chinese, but they have never done anything yet and never will, because they are afraid.

Q. Do any of the white men who are employed by the Chinese as guards and so on, in Chinatown, ever render any aid to the highbinders?—A. They destroy the whole business, because they will never give any information to anybody. They are working for these people and shield them. Of course, the worst houses pay these guards the most money, so naturally they are willing and glad to work for them. This ought to be done away with by all means. Some of them collect \$700 or \$800 a month and would not give it up. There were the McLaughlin Brothers and a dozen others, who are now all rich. As soon as an officer appears, and these guards do not like him, you can't turn a corner before signals are given, and what can you do?

Q. There has been a great deal of talk about a system of electric bells, and so on, that runs through Chinatown, by means of which warnings are given, etc.—A. You can never catch a Chinaman but once in one way. By the time you are within two blocks of a gambling house, for instance, these signals are given and they know an officer is on their track. Everything is quickly removed, and when the officer enters the place they are sitting there peacefully.

Q. If it were made unlawful to run houses of prostitution, would that help to suppress the highbinder societies?—A. They could not exist then. Sometimes there are 20 or more men interested in one woman.

Q. About what proportion would you say of Chinese women that are landed in this country are destined for immoral lives?—A. Ninety per cent. I would not take one bit off of that. They are sold as fast as they can be brought over. There is not a woman who is brought here who is not sold as soon as she arrives. For every girl who comes here they get about \$3,000. They even fool the missions. They get a Chinaman to go up and marry a girl from the mission, then they sell her to some one else.

Q. You have not any suggestions to offer in this matter, have you? There is not anything in connection with highbinders that you have not stated, is there? I do not know just the use the Department will put this to, but they desire to be fully advised on the subject of highbinder organizations.—A. It is impossible to get to the facts of the case on account of the money amongst them. They are impossible to get along with. The condition of things existing among these people is terrible, and persons who are not brought in contact with them would not understand it at all.

Q. The state of affairs as it exists in Chinatown is terrible, is it not?—A. It is a disgrace to the world.

Q. And the respectable Chinese are unable to help it?—A. And they can not do it. The highbinders are assisted by the guides and the attorneys. No decent man can afford to come in contact with these people; he can not afford to get attorneys to defend him in case it is necessary.

Q. And the fact that they do not bother the white people is what has led these societies to pass unnoticed for so many years, is it?—A. That is it. Laws should be made to cope with the Chinese. They have organizations in the nature of clubs, and where gambling was formerly done in open places it is now done under cover of these clubs, which are incorporated under the laws of the State of California.

Q. When accosted by an officer they claim to be playing only lawful games, do they not?—A. An officer has to ring the bell, and by the time he enters the place every evidence of gambling has been put out of sight, and there sits a Chinaman playing a game of casino or some other innocent game, when no sooner has the officer left the place than they go on with their faro, tan games, etc. There is more gambling now in Chinatown than there has been in a great many years, and all under cover of these incorporated clubs.

Q. Are you familiar with the environs of the criminal element of New York?—A. Not very much so. I have been in New York and on Mott street, where I was recognized by a number of Chinamen who had formerly lived in San Francisco.

Q. All the by-laws that have ever been published by white people have never been so binding as these published by the highbinder societies, have they?—A. No; especially in regard to the landing of women.

Q. Some of the laws that you saw had reference to that, had they?—A. Yes.

Q. You are not on the Chinatown force now, are you?—A. No; but whenever they have trouble they send for me.

Q. These Chinese wars break out about once in so often, do they not?—A. Not lately. The last time I was called down there was about a year ago. They have no more respect for our laws than anything in the world. They just laugh at them. I think some law ought to be made to prevent these people from assembling for unlawful purposes. Their places should be kept open, so that passers-by could see into them and know what was going on inside.

EXHIBIT E.

STATEMENT OF CHUN HO, RESCUED SLAVE GIRL, AT PRESBYTERIAN CHINESE RESCUE HOME, MISS CAMERON, MATRON, TO UNITED STATES COMMISSIONER OF IMMIGRATION HART H. NORTH, AT SAN FRANCISCO, CAL., SEPTEMBER 17, 1898.

[Questions put by Commissioner North and answered by Chun Ho, through Interpreter J. E. Gardner.]

When Chun Ho is told that a statement is wanted from her on this matter she bursts into tears, and says it always makes her cry to think of the ill-treatment she suffered at the hands of the highbinders before she was rescued by the mission.

Q. How old are you?—A. 24.

Q. Where were you born?—A. At Ng Jow, in the province of Kwong Si, the province adjoining that of Kwong Tung.

Q. How did you happen to come to the United States?—A. When I was 19 years old, the mistress No. 3 of a noted procurer by the name of Gwan Lung, who lives in San Francisco, went back to Canton, where my mother happened to be living with me at that time, and gave me glowing accounts of life in California. She painted that life so beautifully that I was seized with an inclination to go there and try my fortune, mother taking \$200 Mexican and consenting to my going. I arrived in this country, together with 6 other girls brought by this woman, on the 22d of June, 1893. We all came on fraudulent certificates; the color of those certificates was reddish. (In those days there was such a certificate used, usually known in the customs service as "Red certificates," but they have since been abolished.—J. E. G.) I was told to assume a name to correspond with the name in the fraudulent certificate that was given to me, and I was landed as "Ah Fook." The age in the certificate was 28, and I was told to report my age as 28, which was very much above my true age at the time. The certificate called for a scar on the right temple. As it happened I had no scar. This woman told me to burn my right temple until there should be a mark. The burning was done, but by the time I had arrived in this city the burn had about healed up. The judge had some doubt as to the genuineness of the certificate, and as to my being the party who was entitled to it. I was kept in jail for a few days, but although the burn had healed up, there was some slight mark on my left temple and the judge gave me the benefit of the doubt and I was landed. I was told to claim that I was a married woman; that my husband's name was a Mr. Tsouy, merchant in San Francisco. He was then said to have been a member of the firm of Gum Pun Kee, that was then on Sacramento street, to the best of my recollection. I was also told to claim that my parents were in San Francisco. I was told that if I stuck to those claims I could be landed, and I was landed. The parties interested in my coming over were Quan Lum, his No. 3 mistress, and a noted procurer by the name of May Seen. While I was in jail pending the writ of habeas corpus, these people came frequently to coach me.

When I was first landed I was taken to one of May Seen's houses that were kept by respectable families. They always do that first. From time to time parties came to May Seen's house to see me and to bargain with May Seen as to what price I should be sold at. At the end of two months after my arrival, a Chinaman by the name of Kwan Kay, a highbinder and one who owned some of these houses, came with his woman, Shing Yee, and bought me for \$1,950 gold. They gave me a written promise that in four years I should be free. At the end of two years, after taking all my earnings in the meantime, they said I could be redeemed if anyone would pay the sum of \$2,100.

I paid my first owners hardly less than \$290 a month for the two years; then I was sold for \$2,100 to another highbinder by the name of Tsouy Lung Bo. I was in Tsouy Lung Bo's house for about a year when he wanted to take me into the country. I had to promise that I would go, but in the meantime I took steps to get into the Rescue Home, and before he was able to take me to the country the matron of the Rescue Home came with the police and had me rescued. That was about a year ago, and I am still in the home, but I understand Tsouy Lung Bo has ever since, from time to time, been demanding from me the amount he paid for me, threatening to kill me if I should not pay it before going home to China or leaving the mission. Highbinder after highbinder, through men in his employ or members of his own clique, have been going backward and forward in the vicinity of the home, threatening me and saying it would be much better for me to return to this man; that if I valued life at all to go right back, as the matron of the home could not always protect me. I have an aunt living near the home and sometimes I have visited her, thinking they would not know; but they soon

found out, and even threatened my aunt, saying that if she would persist in keeping me, if any harm came to her they would not be responsible. These men stood on the street and called these things out to me at the windows.

Q. What steps did you take to be rescued?—A. I had a friend who took pity on me, and it was he who told the matron, and the matron got three police officers. It was by appointment that we met a short distance from the house. I had to pretend that I was going out to the nearest store to make a little purchase, and on the way the police met me, as it were, and took me to the home.

Q. Tell us what kind of treatment you received during your stay in either one of these two places?—A. My owners were never satisfied, no matter how much money I made. When they were angered in any way, they would vent their anger upon me, which they would also do upon the other girls. When they saw that the matrons of the different rescue homes were very much on the alert, they very often removed us from the houses of ill-repute to family dwellings when they wanted to punish us, so that anyone passing by could not hear our cries very well. Those who frequent those places say that they could not report my ill-treatment; I was often punished in that way. The instruments used were wooden clubs and sometimes anything they could lay their hands on; and one time I was threatened with a pistol held at me.

The work of removing myself and the other girls from where we were to family places where we were punished, was done by members of the highbinder societies. That was a part of their work, for which they receive pay.

Q. Before you came to the home, did you ever witness any of the doings of the highbinders?—A. Yes; right on Bakers alley, about 2 years ago. Shortly after daybreak one morning, diagonally opposite my window where I was sitting, I saw one highbinder grab hold of a Chinaman by the name of Yee and shoot at him, hitting him in the forehead, and he shot him again in other parts of his body and ran away. Some other Chinamen coming along and seeing this man there when life was just about extinct, called a policeman. The policeman went toward the other end of the alley and brought up several Chinamen. An interpreter told the dying man if he could not speak to nod his head when the right man was brought before him and that man was tried. What became of the case I don't know, but the man that was brought before him was not the one that shot him. The owners of our house told me that I must close the windows and doors and say nothing, as I might be called upon to testify; and in that way the State was deprived of my evidence.

Q. Do you know the circumstances that led up to the murder?—A. I happen to know some of the circumstances; they were briefly these: The night before both men had two girls in a restaurant drinking and feasting. On returning the girls to the house, one of them—out of fun more than anything else—set his dog on the owner of the house. The dog not only barked, but bit the man; the owner got angry and that led to bitter words, followed by the shooting. The man who was killed was the man who set the dog on the owner of the house, and the owner had a highbinder do the killing.

Q. Have you ever seen a girl killed for any reason?—A. Yes; I saw one after she had been killed by a highbinder. This highbinder wanted money from her; she either did not have it or put him off, but because she did not pay the money he wanted she was shot by him. I saw her after she had been shot. This last murder took place on Church alley. I also know of three other women that have been killed by highbinders. Two of these were shot and one stabbed to death. As a rule, the murderers of girls forced to lead that life are never brought to justice, because no one would dare to testify against the murderers, who are highbinders.

Miss Cameron here produces a photograph of Chun Ho, taken in the costume usually worn by the girls in these houses, and makes the following statement in regard to the persecution of Chun Ho by the highbinders within the past two weeks:

Chun Ho left the home to pay her aunt a short visit, not more than a couple of weeks from this house. Two or three days after she had been at her aunt's house a Chinaman came here and asked us to go down to the aunt's house, saying that there was a great deal of trouble. We went, and found that her former owner had the day before sent a highbinder up to tell her that she must either pay him over \$1.00 or else go back and work it out by living that life, and she had sent the highbinder back with a message that she would neither pay the money nor would she go back to that life.

The next evening the owner appeared himself and demanded an interview with her, and the uncle with whom she was staying was afraid to refuse and let him in. He asked Chun Ho if she intended to pay back the price, or if she would go

back to him and work it out. She said that she would not do either—that she belonged to the mission now and that the mission ladies would not let her do so. He said that she was not in the mission now and that he would make a great deal of trouble for her if she did not go back. So then she sent up word for one of us to come down.

We went and asked him if it were true that he had been threatening her, and he said that he had lost a great deal of money, over \$1,000, by her running into the mission and getting away from him, and now he had come to get it back in some way.

We threatened him with the law and ordered him to leave the house, and so he left. She returned to the mission.

In a few days this man called a meeting of his highbinder society (not being present himself, as he was afraid of being present), but he sent several of the highbinders to her uncle's place of business and forced him to go to the meeting. And there they told him that he would either have to make Chun Ho, his niece, go back to this man's house and work out her own freedom, or else he himself would have to pay over \$1,000 for her ransom. He refused to do either, and said that he would appeal to the law and have them arrested if they made him any more trouble; but they still continue to send him threatening messages and to follow her when she goes out on the street to such an extent that, although she is now visiting her aunt, she feels for her own safety she will have to return to the mission.

I will tell you of a case brought to our notice recently in which we were unable to rescue a slave girl through the trickery of these highbinders.

Word was brought to us at the mission that there was a young girl in a house on St. Louis alley, who was very cruelly treated and kept there against her will, and she wished to be rescued and brought to the mission.

We asked for two police officers to go with us to make the rescue and we went down there but on the way we were recognized by some Chinese highbinders and word was sent by their private system of electric bells, warning the different houses of ill-repute that the mission people and two police officers were going down into Chinatown, so when we reached the house where the girl was we found the doors closed and bolted. We demanded entrance, but instead of opening the doors we could hear them putting on more bolts and bars on the inside. We asked the police officers to insist upon their opening the door, but they did not seem to want to do anything in the matter.

Then 3 Chinatown watchmen (white men), hired by the highbinders to protect these houses, appeared and conferred with the police officers, telling them that it was better not to molest the Chinese, and that the mission teachers had no business to force their way into Chinese houses. So we found it impossible to rescue the girl. That night, after returning to the mission, two Christian Chinamen came up and told us that the girl had been watching at the door for us to come and when the alarm was sounded saying that we were near there, the old woman who owned her drew a pistol and holding it at the girl's head, told her to run and hide.

That was the last we heard of her for several weeks, when one day a respectable Chinese woman told us that she had gone into this house on business and saw the girl crying bitterly and asked her what was the matter. The girl said that she was beaten and very cruelly treated and she wanted the mission teachers to come and rescue her. It is useless, however, to attempt to rescue her as the police have no authority to break into the house, and the door is always kept bolted.

Another case of persecution by highbinders is that of a rescued girl who was married from the mission some 8 months ago and she does not dare to leave her husband's house. One day not long ago she was sitting close to a window having her hair dressed and had just left the chair when a bullet came whizzing into the room and just escaped hitting her. I afterwards saw the hole in the wall that the bullet had made where it struck. So that these girls are not safe from the highbinders even after they have married and are under the protection of their husbands.

I am so thankful to make this statement or do anything in my power to assist in placing this matter before the authorities at Washington, and I earnestly trust that some decided steps will be taken to aid the missions in the rescue of these girls and the complete overthrow of these highbinder societies.

EXHIBIT F.

STATEMENT MADE BY MISS DONALDINA CAMERON, MATRON OF THE PRESBYTERIAN CHINESE RESCUE HOME TO UNITED STATES COMMISSIONER OF IMMIGRATION, HART H. NORTH, AT SAN FRANCISCO, CAL., SEPTEMBER 2, 1898.

[Questions asked by Commissioner North and answered by Miss Cameron.]

- Q. What is your full name?—A. Donaldina Cameron.
- Q. What is your occupation, Miss Cameron?—A. Assistant superintendent of the Chinese Mission Home.
- Q. How long have you been connected with the Chinese rescue work?—A. For over 8 years.
- Q. In this city and county?—A. Yes.
- Q. In connection with your work, have you ever come in contact with so-called Chinese highbinder tongs or societies, and their members and their workings?—A. I have come in contact with various members of them.
- Q. In what connection have you met them?—A. In connection with the rescuing of slave girls.
- Q. Can you tell us what their connection with these slave girls is?—A. In one way they buy and sell the girls themselves. That is their principal means of support in a great many cases; in fact, their only means of support is in trading in these girls.
- Q. They are the slave owners, are they not?—A. They are slave owners, and they have gone further and threatened, both the missionaries and the Chinese who have assisted in rescuing these girls, with death.
- Q. As I understand it, there are two kinds of slave girls—those who are called domestic slaves and who are menials and servants, and those who are placed in the brothels?—A. Yes.
- Q. Do the highbinders deal in both kinds?—A. That I am not positive of, but I think they deal principally in putting them in houses of prostitution.
- Q. What class of girls have you principally in this home?—A. We have both classes. We have a great many little ones also.
- Q. The domestic slaves I suppose are placed from the houses of the highbinders in the families of Chinese?—A. Mostly so I think, but I could not state that positively.
- Q. Do these highbinders own the houses of ill fame themselves, or are they merely employed as guards; or what is their connection?—A. I think in some cases they own the houses themselves.
- Q. But invariably they are guarding the houses?—A. Yes; and they are employed by the keepers of the houses to wreak vengeance on the girls who escape.
- Q. And it is customary for the highbinders to wreak vengeance on the girls themselves, is it not?—A. We know of cases where the highbinders have stolen the girls who have married, from their husbands after they had gone to small country places, out of reach of the protection of the missionaries and rescue people, and have there been kidnaped by the highbinders and returned to the places from which they had been originally rescued. We have been notified in two cases that I think of just now, and we have rescued the girls.
- Q. Have you ever heard of the highbinders killing the girls in the houses who tried to escape for any other purpose?—A. I have known of threats, but I have never known of such a thing happening. I have been told by Chinese whom I could depend on that such things have happened.
- Q. It is customary, is it not, for these highbinders to coach the girl emigrants before their examination on their arrival here, as to the necessary way to answer questions in order that they may be landed?—A. I think that is invariably done; there can be no doubt about that.
- Q. They are constantly engaged in furnishing perjured testimony?—A. Yes.
- Q. Is it not customary for highbinders to warn the girls against the missionaries and the rescue home work by preaching horrible stories about them?—A. The girls have frequently told us, after we have rescued them, that they had been told terrible things about the missions before they came here.
- Q. They also threaten them with dire results—even going so far as to threaten death—do they not, if they do not tell the stories they are directed to tell by these highbinders?—A. Yes.
- Q. You regard the highbinders as an absolute menace to the welfare of all these girls?—A. Most decidedly so.
- Q. And against the will and desire of a large number of them?—A. Yes, indeed; I do.

Q. Is it not your experience that at least a larger number of Chinese girls that come to this country are personally desirous of leading virtuous lives?—A. I think the larger proportion of them have no idea of what they are going to do, most emphatically.

Q. What per cent of the girls that are brought to this country do you suppose are destined for bad lives?—A. I was almost going to say 99 per cent.

Q. At least 90 per cent?—A. I should safely say that.

Q. Have you any idea of the earnings of these girls or their owners?—A. I think the average earnings are supposed to be in the region of \$5 and \$6 a day.

Q. Are these girls purchased as slaves in China and brought here in slavery, or do they come voluntarily in the first instance?—A. I think quite a number come voluntarily, never dreaming what their fate is to be; but I think a great many are landed against their will, especially when it comes to bringing them right here and they get some idea of what they are going to be brought to.

Q. Of the 90 per cent they all come as slaves? As I understand it, these girls are purchased by procurers and others in China, and the agents of the highbinders and their allies bring them here, and they are to all intents and purposes slaves when they leave China.—A. They are bought and paid for in China. They are made to take their own purchase money in their own hand and give it to the person who is selling them, so that it can not come back on the head of the person of the highbinders. That is the Chinese idea, so a girl told me.

Q. Do you know if there are any Chinese women who belong to these highbinder societies—any allies and female brokers?—A. Yes; I think in everyone of these bad houses there is one woman or more who assists in getting the girls.

Q. Do you know whether they are supposed to belong to the highbinder tongs themselves or are they merely working in unison with the highbinders?—A. I really could not say whether they belong to these societies or not, but I know they work in unison and do as much as the men do in getting the girls and in holding them after they have them.

Q. Have you ever come in open conflict with the highbinders since you have been in this mission?—A. In rescuing the girls I have had the men take hold of them and try to drag them away from me, while the girl was holding on to me and trying to come with me. I have had that experience several times.

Q. These Chinese highbinders, as I understand it, never lay hands on a white person?—A. They have never touched me, but often laid hands on my predecessor, Miss Culbertson. On one occasion she had her dress nearly torn off in Fresno in trying to get a girl away on the train at night.

Q. It is a very rare occurrence, is it not, for them to lay violent hands on Americans?—A. Yes; I think it is quite an unusual thing.

Q. But it is customary and ordinary for them to do deeds of violence to Chinese, both men and women, is it not?—A. Yes; indeed it is.

Q. Were it not for the highbinders a large number of these girls would not stay in these houses, would they?—A. I think not. I think there are converts in Chinatown to-day who would gladly leave if not terrified by what would be done to them should they attempt to escape.

Q. Have you ever known head money to be laid on the girls in those houses?—A. In numberless cases.

Q. Do you know how much is offered as a rule?—A. I know hundreds of dollars.

Q. How many hundreds?—A. I do not like to say, as I do not remember exactly, but the last case that I think of now was \$500. It is according to the value of the girls.

Q. Do highbinders ever hang around these premises looking for girls?—A. Very frequently. We never receive a girl that the highbinders do not hang around the home more or less for a day or two. We have a chain attached to the inside of the door, so as to prevent the pushing of it open. We always put it on when we open the door.

Q. Would they, in your opinion, come into the house and steal the girls away, should an opportunity occur?—A. Yes; they would. They would even follow us to church. In taking them to church, as we do Sunday evenings, in days gone by they have tried to get them. Only two weeks ago they had a carriage here at the corner to get the girl that we rescued from Sacramento a short time ago. So we do not take her out at night now; just take her out in the morning.

Q. When you go to church, do the highbinders go so far as to slip into church after you?—A. Yes; they have done it. I have no doubt but they frequently do, but I have been positive of it only a few times. Just a few weeks ago some came into the church.

Q. Can you tell a highbinder from one who is not by his appearance?—A. Yes; I generally have a pretty good idea of them.

Q. There are certain characteristics about them that are familiar to the Chinese race, are there not?—A. I have not been long enough identified with them to be able to tell.

Q. Do you know how the highbinders are regarded by the respectable Chinese element?—A. I know they dread them very much indeed; fear them very much. In fact I feel very sure that all the respectable Chinese would wish to have the highbinders banished from the country entirely.

Q. Have you any idea how the highbinder societies could be broken up; by passing what laws?—A. That is too deep for me.

Q. Do you think that if Chinese houses of ill fame were absolutely prohibited it would have any effect in breaking up the association?—Yes, I do; for so many of them depend entirely upon them for support. If the importation of the girls were stopped they would close these houses.

Q. How many Chinese girl inmates of this home are there now, Miss Cameron?—A. We have 39.

Q. How long has this home been in existence?—A. Twenty-three years, I think.

Q. Do you know how many girls have been rescued in that length of time?—A. Over 600; I am not positive of the exact figure.

Q. Do you know about what value is placed on the Chinese slave girl by these highbinder societies and others that are dealing in them?—A. Frequently over \$2,000.

Q. Ranging from \$1,500 to \$3,000, according to the age and appearance of the girl, is it not?—A. Yes.

Q. Have you ever received any threatening letters?—A. Numberless letters have come during the three years that I have been here; slipped in under the door, from Chinese of course. We rescued a very pretty and very young girl who was offered at \$2,000. She had only been here a few months, and about a week after we took her into the home there was a great deal of trouble about her, and the highbinders came after her a great deal. One morning when the man came around with the newspaper he found a large dynamite cartridge about a foot long standing up against the front door, placed in such a manner that when the door should be opened the cartridge would fall in and explode.

Q. It was so placed against the door that it was evidently intended to be exploded by the opening of the door?—A. Yes; and when the police were called they found that at all the basement windows similar cartridges had been placed in such a way that when the windows should be pushed up they would be apt to explode.

Q. When was that?—A. Three years ago last April. That is the greatest threatened act of violence that has ever been attempted against the home. Miss Culbertson, my predecessor, was attacked by a Chinaman with a knife; not really attacked, but a Chinaman was coming directly toward her with an open knife when she was rescuing a Chinese girl.

Q. Have you ever yourself seen them draw weapons?—A. No; I never have.

Q. You only attempt rescues, as I understand it, when information is brought you that the girls are desirous of reaching the home?—A. In the cases of grown girls we wait until we hear that they want to come; but where smaller children are concerned we and the officers of the Society for the Protection of Children take them.

Q. What experience have you had with habeas corpus proceedings?—A. They nearly always serve writs of habeas corpus on us when we rescue a girl.

Q. That is, the attorneys for the Chinese highbinders?—A. Yes; the highbinders hire the attorneys.

Q. They try in all ways possible to interfere with the operation of these homes, do they?—A. They go in as witnesses to say that the girl is the wife of some man who is there in court, or the daughter of someone else, and try to claim them in that way.

Q. Try to intimidate the girls all they can, do they not?—A. As we take a girl through the corridors they stand alongside and threaten them, and say that no matter how long it may be they will get them back some way and wreak their vengeance on them.

Q. They oftentimes succeed in terrifying the girls to such an extent that they get them back, do they not?—A. They have done so.

Q. Have you ever rescued girls who have borne evidence upon their persons of scars and other indignities inflicted upon them by the highbinders?—A. Yes; often.

Q. And have they told you that the punishments were inflicted by the highbinders?—A. Yes.

Q. For what purpose?—A. Generally because they did not earn enough money.
 Q. Have you any Chinese girls here now who would be willing to relate their experiences, and whose experience might be of interest in this matter?—A. They are very timid when it comes to giving evidence, but still I think I can persuade one or two to do so.

EXHIBIT G

STATEMENT OF GON SING, RESCUED SLAVE GIRL, AT PRESBYTERIAN CHINESE RESCUE HOME, MISS CAMERON, MATRON, TO UNITED STATES COMMISSIONER OF IMMIGRATION HART H. NORTH, SAN FRANCISCO, CAL., SEPTEMBER 2, 1898.

[Questions put by Commissioner North and answered by Gon Sing, through Interpreter J. E. Gardner.]

Q. How old are you?—A. 19.

Q. How long have you lived in this country?—A. Nearly 2 years.

Q. How did you come to leave China?—A. Glowing stories were told me of the life of the Chinese in California, which I believed, and which first led me to come over here. I was bought in China by a Chinaman, acting with a Chinese woman, for \$680, Mexican. Then I was sent over here to California by those people. I was told that when I came here I would be married to a respectable, wealthy Chinese merchant. Soon after my arrival, however, I found that was not the intention of all these people. I was resold for \$1,680, gold. I was first placed in a house of ill fame in San Francisco, but finding that I was not willing to stay and that I wanted to get into the home, they removed me to Sacramento and placed me in a house of ill fame there. I managed to send word to Miss Cameron, the matron of this home, secretly, and she took steps to have me brought down here, and so I was rescued. This house in which I was kept for a while in Sacramento was kept by a Chinese woman and a Chinese highbinder.

Q. Describe what took place at your rescue.—A. My clothes were nearly snatched off of me at the rescue.

Q. Were you threatened in any way by the highbinders?—A. When in the house in Sacramento I was punished and often struck by the owner of the house because I did not make myself agreeable and because I did not earn enough money for the owners. I had bruises on my person at the time I was rescued. The instruments used were poles and rattans, and I was also threatened that if I ever went to the home when they got me back again they would kill me, but the place was altogether unbearable, and I preferred death to remaining and would take the chances, and so I was rescued.

Q. Did you ever know of any girls being killed by the highbinders?—A. Yes.

Q. Whereabouts?—A. Both in San Francisco and in Sacramento.

Q. Did you ever see with your own eyes a girl killed?—A. Yes.

Q. Where was it; here or in Sacramento?—A. I saw one with my own eyes in Sacramento killed by the highbinders, and I saw one with my own eyes killed in San Francisco.

Q. Will you please describe the killing of the one in San Francisco?—A. The one in San Francisco was shot to death; the one in Sacramento was killed by opium poisoning.

Q. Where in this city was it that the girl was shot?—A. It was in one of the lanes in Chinatown, and took place soon after I arrived here, so that I can not very well remember the English name, but it was in one of the lanes in which these houses are.

Q. Was it during the day or in the night?—A. At night.

Q. Was it in the lane or in the house that faces on the lane?—A. The girl was in the house at the time.

Q. Why was she killed, if you know?—A. I never could get at the bottom of the case, but it was generally believed that there was a little spite about it at the commencement, and then she was one of those who would not earn any money.

Q. How was she shot? Did anyone hold her and someone else shoot her? Describe it.—A. I can not describe how the murder took place.

Q. What was done with the murderer? Did the matter ever become known to the white authorities?—A. I never heard of the murderer being punished.

Q. When a girl grows old and is unable to earn much money, is it not rather customary to kill her?—A. I have heard of their being shot, but I have never seen any old ones.

Q. Do you think they are killed sometimes for the effect it will have on the others?—A. Yes.

Q. Is it not a fact that when a girl has been murdered all the other girls are given a chance to see her body to see that she was killed?—A. Yes.

Q. Why was the girl killed at Sacramento?—A. They were both killed. The one in San Francisco was killed by a pistol shot and the one in Sacramento by pium poisoning, but the one in Sacramento was driven to take poison herself on account of the unbearable position in which she was placed.

Q. Just tell us what you know about the operations of highbinders in connection with these houses.—A. They levy blackmail on the girls in the houses. They undertake to protect the owners against loss, and I have known instances where, after they have undertaken to protect the houses, when a girl or girls would be lost, the highbinders would have to make up the loss, so that they make a regular business of protecting these houses.

Q. Do you know of witnesses being supplied by them to carry out the wishes of the owners of the houses?—A. That is their business. They furnish false witnesses, and fighting or shooting would also be done by the men that they supply. At this very hour I dare not walk the streets of San Francisco alone on account of the highbinders.

Q. Do you know the names of any of the highbinder tongs in Sacramento?—A. King Gung Tong and On Yick Tong.

Q. Do you know whether these are branches of tongs existing in this city?—A. They are branches of highbinder tongs in San Francisco.

Q. Have you ever known them to threaten Chinese other than the girls in the houses?—A. Yes, I do know.

Q. You believe, do you not, that the better class of Chinese are in constant fear and terror of the operations of the Chinese highbinder societies?—A. Yes, I know that the better classes of Chinese are in constant fear of them.

Q. Since your rescue have you had any threats or been approached at all by highbinders?—A. Immediately after my rescue a reward of \$500 was offered for my recapture. A warning was given me to be careful on my way to church with the other girls, as I might be kidnaped by the highbinders. As a matter of fact, met four of them on the way to church at the intersection of two streets with a marriage alongside of them. Since then I have not deemed it prudent to go out.

Q. By what method were you landed in this country?—A. I was landed in this country by perjured testimony. A highbinder presented himself at the customs-house claiming that he was my father, and one or two others claiming to have known me in China, and on their testimony I was landed. On the boat on which came over there were nine other slaves, all imported, and all were landed.

STATEMENT OF GUI NGUN, RESCUED SLAVE GIRL, AT PRESBYTERIAN CHINESE RESCUE HOME, MISS CAMERON, MATRON, TO UNITED STATES COMMISSIONER OF IMMIGRATION HART H. NORTH, SAN FRANCISCO, CAL., SEPTEMBER 2, 1898.

Questions put by Commissioner North and answered by Qui Ngun in English without the assistance of the interpreter.]

Q. How old are you?—A. 16.

Q. How long have you been in this country?—A. 9 years.

Q. How long have you lived here at the home?—A. Nearly 7 years.

Q. Did you come to this country with your father and mother?—A. No.

Q. How did you come to this country?—A. My father was poor and he sold me to another man.

Q. That was in China?—A. Yes.

Q. How much did he sell you for?—A. \$200 Mexican.

Q. Who was the man that he sold you to; a highbinder?—A. No, he was not a highbinder.

Q. Did this man bring you to this country?—A. Yes.

Q. How did he get you here; did he say that you were his daughter, or do you now?—A. I don't know.

Q. What did he do with you?—A. A woman tried to put me in a bad house.

Q. When you were a little girl?—A. Yes; and teach me how to sing. They have a number of girls who are quite young and who sing at feasts.

Q. You were to be put into a house as a "sing song" girl?—A. Yes.

Q. Were you put in such a house?—A. The man that brought me here would not let the woman put me in the house.

Q. What did you do; just stay there with the man and his wife?—A. Yes.

Q. Did they make you work?—A. Yes.

- Q. Did they ever beat you?—A. Yes; they took a great big stick and beat me with it.
- Q. Why did they do that?—A. He gambled, and if he lost money he came home and beat me.
- Q. The woman used to beat you pretty often with a big stick, did she?—A. Yes.
- Q. Did you stay with her until you came to this house?—A. Yes.
- Q. Were you rescued there?—A. No.
- Q. Did you run away and come here?—A. Yes; I ran away and someone told Miss Culbertson, and Miss Culbertson came and got me.
- Q. Were you sold more than that once?—A. No.
- Q. Did you see the money that you were sold for?—A. She put it on the table for me.
- Q. You were about 9 years old at that time, were you?—A. Yes.
- Q. That was in China, was it?—A. Yes.
- Q. Where in China?—A. In Hongkong.
- Q. You came over to this country with the man and his wife, did you not?—A. Yes.
- Q. And she would put you in a bad house, but he would not let her, is that it?—A. Yes.
- Q. Did you learn to sing?—A. I pretty nearly learned to sing.
- Miss Cameron here presents Chun Wui, a Chinese slave girl, whom they had rescued and who had been in the home for 20 years. Chun Wui was blind, made so by being shut up in a chicken coop all night for punishment, and the vermin had destroyed her sight.

EXHIBIT H.

STATEMENT OF THE HON. HO YOW, HIS IMPERIAL CHINESE CONSUL-GENERAL AT SAN FRANCISCO, TO THOMAS F. TURNER.

- Q. How long have you filled the office of consul-general at this point?—A. Nearly 8 years; first consul and then consul-general.
- Q. During your residence and official station at San Francisco have you had occasion to study the disturbances caused by the so-called highbinder societies?—A. Yes, sir.
- Q. Would you be able to state about how many highbinders of the highbinder organizations of the criminal class are in this city?—A. Of the worst kind of them about 400 or 500, but the others are inactive and are forced into it for self-protection.
- Q. Is there not some means which might be devised to get rid of them and thus save a lot of trouble?—A. Yes, sir.
- Q. Why is it that the State laws are inadequate to reach this evil?—A. In the first place, they can not make any special laws for the Chinese, and innocently to a certain extent protect them. Under the guise of law they can get incorporated and then do all sorts of things.
- Q. As I understand, the system under which the highbinders operate and the fear which they inspire in all members of their race makes it impossible to secure testimony?—A. Yes; when any of them testify in such cases they are marked for life.
- Q. Is it not a fact that the authorities trace nearly all the misdeeds of the Chinese to these highbinders?—A. Undoubtedly; if we could get rid of the highbinders and disperse them there would be no trouble. There would be better government and the better relations of the American and Chinese would be cultivated. No progress can be made in trade on account of the highbinders.
- Q. What would you think of a law of Congress that would provide that mere membership upon the part of any alien in this country in any organization that has for its purpose the commission of crime or violation of law would be felony and any alien found belonging to such organization should be deported?—A. If such a law could be enforced I think it would be an excellent thing, but it is very hard to prove that they are other than what they represent them to be, seemingly innocent organizations, as they are corporated under the State laws.
- Q. How would it be to specify the different things which are considered violation of the law, such as blackmail, etc.?—A. I would make this suggestion: Before any organization can be perfected the by-laws must be submitted to the representative of their own country and secure the official indorsement before the organization can be perfected.
- Q. I had in mind, Mr. Consul, the organization of a special court or tribunal

before which might be tried all the questions which may arise, such as to deportation, etc., and rather than vest such great power in any one man, I thought it would be wise to have a court of three or four members and the consul or highest official at each port representing each country to act as ex officio member of such court?—A. I think it a very good thing and quite agree with you.

Q. Is there any suggestion with reference to the Chinese exclusion law that you care to make?—A. Yes, sir; take in the first place these-called native sons—now in the bill pending before the Senate, it says that a native son returning to this country must have one or two white witnesses to swear before the collector as to his birth, and that no other evidence will be accepted. This is very hard for the Chinese; it does not give them their rights. It is all right to prove a certain thing, but to have a certain person to prove it is very hard. It is almost impossible to always have two witnesses to one's birth. Another thing provided in the bill is that those native born who are not registered and whose birth is not certified to in court, can not return. There are two or three thousand native sons in China now who will be excluded if this law is passed.

Q. What would you think of a law which will in the future require all Chinese children to be registered at birth?—A. There could be no objection to that if registered within one or two years.

Q. Have you any idea about how many native sons there are now in this city or State?—A. About 2,000, as far as I know.

Q. Why is it that they do not exercise the right of suffrage and become interested in our laws?—A. They have not had any leaders in that respect; they have had no one to instruct them. They can not read the Constitution, but I believe that the Chinese are working up to that.

Q. Do you not think that it would help to solve the trouble if they took an interest in our local affairs?—A. Yes, sir; our object now is in that direction, to lead them on. They would have gone right on, but have no encouragement.

Q. Has it been brought to your attention that the Japanese are cutting in in competition with the Chinese?—A. Yes; but they can not hurt the Chinese labor, but hurt the white labor more. They can not come up to the standard of the Chinese; they can not be trusted. Their cutting under the wages of the Chinese will affect the market, but not the Chinese. Another point of the exclusion law, no professional can be considered a merchant. There ought to be an extension as to the profession, such as missionaries, students, doctors, lawyers, etc.

Q. Is it not a fact that, under the present administration of the laws here, a great many hardships are placed upon the merchant that should not be placed upon him?—A. Yes; in my opinion a photograph and certificate given to a merchant and then identified upon his return should be sufficient. All investigations should be made before he goes and when he comes back; no trouble should be had. Another point that I would like to bring to your notice: If a merchant wants his wife to come, hitherto all he had to do was to prove that he was a merchant, and the wife and minor child was his wife and child, respectively; but now, since last year, they made a ruling that all children who come here, or the wife of a merchant, must have a certificate of identification. If a merchant has a wife or child in China and wants his wife and children in America, it will be almost impossible for them to prove that they are the wife of this man. All the proofs are on this side, and she can not prove that her husband is a merchant. If a merchant proves his standing and proves her to be his wife, that should be enough. The exclusion act is to prevent cooly labor and not other classes. Another point is that the law allows a laborer to go back to China and limits his time of return to one year. Why not, if he were sick and could not get back within that year, allow us to extend this time? If you allow him to return within one year, you should allow him to return within five years. If the law could be revised and changed to permit return within three years instead of one, I think it would be more reasonable.

Respectfully submitted.

Ho Yow.

SAN FRANCISCO, April 4, 1900.

EXHIBIT I.

STATEMENT MADE BY A CHINESE TO THOMAS F. TURNER, AT SAN FRANCISCO, CAL., DECEMBER 23, 1899.

Q. What is your name?—A. My name is ——

Q. Where do you live?—A. San Francisco.

Q. What is your business?—A. Merchandise; importer of rice, tea, oil, and opium.

- Q. How long have you been in the United States?—A. Since 1863.
- Q. Have you lived all the time in San Francisco?—A. Yes, sir.
- Q. How long have you been in business?—A. Since—I think about 30 years.
- Q. Can you tell in just a general way about how much business you do in a year?—A. I guess about on an average of from \$30,000 to \$50,000.
- Q. How much do you pay on an average in customs duties to the Government of the United States?—A. During the last 3 years I have averaged about \$5,000 a year.
- Q. What condition is your business in at the present time?—A. My business is in good condition; I am prosperous and am doing well.
- Q. I understand that you are preparing to go back to China; is that true?—A. Yes, sir.
- Q. When do you expect to go?—A. On the 17th of this month.
- Q. Will you tell me why you are going?—A. Well, 3 years ago I was elected ——. There were 12 highbinder tongs in the city of San Francisco who notified me as ———, that when any member of our society went back to China, they must pay to the highbinders a head tax of \$3 each, so in order to defend and protect our members that they would not have to pay this tax to the highbinders, I refused to let them pay it, so they could get nothing from the members. But my time as ——— was up the 1st of last August, and another man took my position as secretary. The next man who was elected was afraid to interfere and did not attempt to prevent the highbinders from collecting the \$2 from each member of our society. Some of them paid it and some did not, saying: "We did not pay it during the last 2 years when ——— was secretary, why should we pay you at the present time?" Then the highbinders said ——— has interfered in our business, so the thing to do is to get ——— out of the way, and also the merchants of the ——— society out of the way. So they put a price of \$300 on the heads of 8 merchants in my society and upon myself. This is why I thought I would take a trip home until their temper cools off.
- Q. What notice did you get that \$300 had been placed on your head?—A. Friends came to me and told me to get out of the way and out of danger.
- Q. At what time did you get that notice?—A. About a month ago.
- Q. Have you, since you have received that notice, been able to go around Chinatown freely, without a guard?—A. No.
- Q. What have you done to protect yourself?—A. I have been to the city hall and told Judge D. J. Murphy that my life was in great danger. I said to him: "I do not know what to do; you are a friend of mine, and I will take your advice." He then took me down to Chief of Police Lee, and said to the chief: "This is an old friend of mine and I don't want to see him killed, and I want you to do the best you can for him and protect him." So the chief sends a policeman to guard my place every night since I gave him notice.
- Q. Do you have any guard of your own?—A. Yes; my nephew.
- Q. What does he do?—A. He stays with me and attends to my business, and whenever I go out around town he goes with me.
- Q. Are you afraid to go out alone since you got that notice?—A. I always have a guard. I never go out alone through Chinatown.
- Q. Why don't you like to go through that part of town?—A. I am afraid that some highbinder might take my life.
- Q. Can you explain to me so that I can tell the authorities in Washington why the police in San Francisco can not break up these highbinders?—A. The law is a little too easy for them. For instance, they want to murder a man; they send a half a dozen highbinders to go together; the one who is to do the shooting will wait for his victim while the others stand near by to guard against policemen. As soon as they did the shooting, they throw the gun into an ash barrel, and so have no weapon, and when the policeman comes, all the Chinamen come out together and they can not tell who did the shooting. Unless the policeman saw the man do the shooting, there is no way of catching them.
- Q. Why can the officer not find the other Chinamen who saw the killing, who would be willing to go into court and tell what they know?—A. They are afraid to tell.
- Q. Why are they afraid?—A. Afraid that the highbinders will go after them.
- Q. What will the highbinders do to some good Chinaman who saw the killing and would testify to that in court?—A. He knows that they would kill him if he testified in court.
- Q. How many highbinders do you think there are in San Francisco?—A. From 500 to 1,000.
- Q. Are all of the members of the highbinder society bad men?—A. Some good ones. Some merchants have to go in to protect themselves from harm. About 100 are very bad; the rest are afraid to kill.

Q. When one of these societies want to kill a man, how do they select the man who is to do the killing?—A. Each highbinder has a number, and they are selected according to their number to do the killing.

Q. Tell me what the highbinder society is organized for?—A. Blackmail and murder, and some of them make it a part of their business to aid in bringing slave girls into the country.

Q. Do the highbinders fear the laws of the State of California?—A. They are not afraid of the laws of this State. They say they are too easy.

Q. Is it not a fact that a great many of the highbinders in Chinatown were criminals in China?—A. Yes, sir; they are not so bad as here. They would not dare in China to do the acts that they would here. They do not dare to murder in China because they would be beheaded. In China we find out who did the murder. If we can not find him, we arrest his father, brother, or nearest relative and behead him. This makes the Chinamen very much afraid to commit murder. Under the law of the United States it is so hard to convict one that they do not care for the laws.

Q. What do you think would be the best way to break up the highbinders in Chinatown?—A. Some time ago the Chinese consul at this place, with the aid of the police, almost broke it up. The highbinders have lawyers of this city in their employ regularly, who aid them in every way possible, and are paid big fees by the highbinders. They even told me that if the members of our society did not pay the \$2 head tax, they would send Lawyer Campbell, their attorney, who would compel us to pay. I told them that I did not fear it, and that if the lawyer tried that I knew we could send him to the penitentiary.

Q. Suppose there was a law that would provide that every member of a highbinder society might be sent back to China, what effect do you think such a law would have?—A. The thing that the highbinder fears most is to be sent back to China, and if a few dozen were sent back I think it would break up the highbinders.

Q. What would happen to the highbinders if they were sent back to China?—A. They would be watched very closely in their native village and would have great difficulty in getting along. They would perhaps be killed by a relative or one who was a victim in this country.

Q. Do you know how many highbinder societies there are in San Francisco?—A. There are any number, some of which are Chee Kung Tong, Suey On Tong, Hop Sing Tong, Hip Sing Tong, Suey Sing Tong, Bing Guing Tong, Hip Yee Tong, Quong Dock Tong, Jo Lum Sen Tong, Jew Yee Tong.

Q. Have these highbinder societies anything to do with the Six Companies?—A. No, sir.

Q. Please explain just what the Six Companies are.—A. For instance, our northern people have a society of their own, the southern people, etc. Each company represents the different neighborhood of China.

Q. What is the purpose of each company?—A. Help the poor, take care of the old and infirm, and when they die provide for having their remains buried.

Q. What kind of a head does your company have?—A. A president.

Q. How is he chosen?—A. By election. Only the business men and merchants of the company have a vote. In my society there are about 80 merchants or representatives of stores, and we choose the president. A member of the company who has no store or interest in a store, and no property, has no vote. The Six Companies are joined together and have another man at the head of all the Six Companies. Acting together, they protect the rights of all their people, take care that their interest is protected, and if they are sick they are taken care of.

Q. Why is it that, with the police protecting you, you do not feel safe to remain in San Francisco?—A. I can not expect an officer to watch me all the time, and I know that if an officer were not watching all the time I would be killed by the highbinders.

Q. How many merchants and prominent Chinamen do you think are driven back to China each year by the highbinders?—A. Two or three have been compelled to leave on account of this last trouble, and a great many from time to time are compelled to leave.

Q. The class of Chinese that are compelled to go are the most respectable or better element, are they not?—A. Yes. It is because these men have money and are prosperous that the highbinders get after them, and all those who do not submit are compelled to leave the country.

Q. About what per cent of the merchants who stay here have to pay the highbinders?—A. A very great many of the merchants are compelled to pay the highbinders, but a few of us have refused. I have advised the merchants that if they had any money to give away or spend to give it to the poor and where it will do some good, and not to give it to these men who make their living through blackmail.

EXHIBIT J.

STATEMENT OF HON. J. P. JACKSON, COLLECTOR OF CUSTOMS, SAN FRANCISCO, CAL.

OFFICE OF THE COLLECTOR OF CUSTOMS,
San Francisco, Cal., December 14, 1899.

HON. THOMAS F. TURNER,

Special Agent United States Industrial Commission, San Francisco.

DEAR SIR: Referring to our conversation some days since concerning the Chinese exclusion laws and matter in this customs service incident thereto, and your suggestion that I should embody my views thereon in a letter to you, the opportunity now offers to write you as follows:

The number of Chinese resident in this city has materially decreased in late years. Whereas there were about 35,000 of them congregated here some fifteen years ago, I think it doubtful if there are now remaining 20,000 of all classes, male and female. The report of the Treasury Department for the year ending June 30, 1899, shows that there were less than 4,000 new arrivals during the last year through all the ports of the United States.

There is a general misunderstanding in the public mind as to the present status of the exclusion laws. It is not generally known or understood that there is no exclusion law against the coming of all Chinese. The specific interdiction is against "laborers" alone. No Chinese laborer can now come to the United States for the "first time," but such laborers already here can go and come between here and China at will if they have a wife, child, or parent here, or own property or have debts due them of the value of \$1,000.

Also all other Chinese who are of the exempt class—that is, who are not laborers—if rightfully in this country can go back to and from China at their pleasure.

The classes of Chinamen who can now come from China to this country for the first time are declared in the treaty to be officials, teachers, students, merchants, and travelers for curiosity or pleasure.

The foregoing classification takes no cognizance of Chinese persons who were born in this country; their right and claim to come and go at their own free will is grounded entirely upon their American citizenship. It is with claimants under this head that the most trouble is experienced and the most fraud perpetrated.

I do not believe that as many as 10 per cent of those coming to this country as merchants are fraudulent, while under the plea of native American born I would not think 20 per cent too high an estimate of the counterfeit claimants.

In the case of those claiming to be native born, Chinese testimony is permitted under the law to establish their nativity, whereas merchants are required to prove their status by witnesses "other than Chinese."

I think it is very doubtful whether under the United States Constitution and laws a different requirement could be enforced in proving nativity here of a Chinaman from that provided for a white man—that is, either may prove it by such witnesses as may know the fact, irrespective of racial distinction.

A requirement that all Chinese births should be registered upon the proof of such birth by father, mother, and midwife would seem to be a safe precaution against future fraudulent claims of this class.

As to merchants who return to this port after visiting China, I think their entry here should be facilitated in every way consistent with the treaty between this country and China and the statutes passed in pursuance thereof. I say this because there have been numerous instances where detention of merchants either on shipboard or in the "detention loft" here has been productive of sickness, loss, and damage to health and business. The practice here is to make investigation of the status of merchants at their homes in this country during their absence in China, and thus prevent as far as possible undue detention after their return from their visit. But it often happens that these investigations are not fully satisfactory, needing explanations which only the merchant himself can give, and thus necessitating a new course of inquiry, while he must remain "in durance vile."

I would recommend in case of merchants the same course of procedure that is now required in the case of "returning laborers"—that is, have the status of the merchant determined before he shall leave this country, and then give him a "return permit," which will insure him a landing on presentation.

As it is now a returning laborer can secure a landing immediately on passing quarantine without question or cavil, thus placing him in a much more advantageous position than a merchant.

If I thus seem to favor the "merchant" over the "laborer," it is because I esteem him as a much more desirable denizen.

My experience as collector enables me to judge of the value to the Government of the Chinese mercantile business. The entire amount of duties collected at this port during the month of October last was \$603,644.63. Of this sum the Chinese paid \$175,836.81, considerably more than one-fourth of the whole. In November (last month) our collections were \$508,560.23, of which Chinese paid \$156,787.27, nearly one-third of the entire sum.

These two months are not at all peculiar, but are noted as the latest evidences of the business. I have before me a long list of Chinese merchants who pay annually customs duties running from \$10,000 to \$200,000 each, four of them paying over \$100,000 annually and two firms contributing yearly between \$150,000 and \$200,000 to the Government coffers.

These same merchants subscribed lately over \$6,000 to the citizens' fund for welcoming back our soldiers from the Philippines, which was more than one-tenth of the entire amount collected.

Therefore it is that I say they should be fairly treated, especially as the commodities in which they deal are generally of unique character and peculiar to themselves, and thus do not come in any great degree into competition with our own "white traders."

Now, as to laborers, they do come into direct rivalry with our own working population. They have superseded "Bridget" and "Katherine" in the kitchen, and "Annie" and "Nellie" in "upstairs work." The laundry business is almost entirely monopolized by them. As a consequence of this invasion of the household, San Francisco has become conspicuously a city of boarding houses. Families find it easier, if not cheaper, to board rather than to "keep house."

There is still another field in which the Chinese laborer has been utilized, and that is in the vineyard and orchard. While there has been at times a protest on the part of labor organizations against the Chinaman in the harvest field, yet it must be admitted in the busy season his services are welcomed by the vintner and orchardist, and he has shown himself a necessity in this State, where only this season the schools in at least three counties declared a vacation in order to permit the scholars to work in the orchards and canneries.

A new feature in the element of house service has not long since arisen by the advent here of the Japanese. I regard this class of laborers as a decidedly greater menace to our white laborers than are the Chinese.

The qualities that commend the Chinese to favor as laborers are sobriety, industry, and servility. Their vices are gambling and opium eating. These last are indulged generally among themselves.

The Japanese have not the foregoing qualities distinguishing the Chinese, but on the contrary are cunning, shrewd, and crafty. They underbid the Chinaman in his chosen spheres of employment, but unlike him do not nourish or foster their employment, but hold the same only so long as there is anything to be learned thereat, when they will unceremoniously quit the service regardless of obligation or inconvenience to employer. They are at all times self-important and ever ready to resent any imputation against them or their country. They are in no manner naturally servile, but will smother resentment for the time, simply biding the opportunity to vent their revenge. They will work when so necessitated for just so much less than any other laborer as will drive him from the field, and, this done, will then exact the uttermost farthing which the urgency of the work must yield. I think we have much more to fear from Japan than from China.

Now, another matter: I do not know whether it is within the purview of your inquiry to consider the position of the collector of customs with reference to this Chinese business. I will take the liberty, however, of explaining myself thereon.

As you well understand, the entire responsibility of passing upon all Chinese admission papers is placed upon the collector. He examines all laborers' applications for "return permits," all merchants' papers for their return, all certificates from foreign governments for "first comers," and all the evidence in "native-born" cases. Such a draft is this upon my time and attention that when the special agents of the Treasury Department, Messrs. Smith and Linck, investigated the affairs of this custom-house in February last they reported to the Department as follows:

"We find that the greater part of the time of the present collector at this port is devoted to the consideration of Chinese business, hence he has little time to give to the legitimate duties to which he was appointed."

But apart from the fact that my time is thus preoccupied and taken from the duties of the custom-house proper, I hold that the two positions of collector and Chinese inspector, or judge (for such is one of my functions), are totally incom-

patible. This Chinese business is a parasite that should not be fastened on the custom-house. The duties are not cognate in any manner to those of the collector. My duties as collector are to collect revenue, and while so doing to see to it that the custom-house is not made an obstacle to commerce, a deterrent to trade, and a hindrance to business. It is incongruous that with one hand I encourage the Chinese in trading and business and with the other hand deny them admission to the country. Especially is this true now, when the policy of our country is evidently to foster good-fellowship with China in order to secure a greater measure of her trade. I am fixedly of the opinion that this excrescence should be severed from the customs service.

The proper and fitting place for enforcement of Chinese-exclusion laws is the immigration bureau. It has the control of the contributions of all other nations to our population, and why not the Chinese?

I can see nothing so different or peculiar in the immigrants of China and those of Japan that the same authority should not have jurisdiction over both.

I sincerely trust that the transfer will be made by Congress, and to that end I beg to invoke your favorable, valuable interposition, and remain,

Very truly, yours,

J. P. JACKSON, *Collector*.

EXHIBIT K.

STATEMENT OF J. D. PUTNAM, CHINESE INSPECTOR.

LOS ANGELES, CAL., *March 20, 1900.*

HON. THOMAS F. TURNER,

Los Angeles, Cal.

SIR: In accordance with your request, as a representative of the Government, for my observations and views in Chinese matters, I would respectfully report upon my observations in regard to the manner in which the Chinese-exclusion act has been enforced, and take the liberty of making some suggestions upon the matter of Chinese exclusion as the subject has presented itself to me after 5 years of careful and constant study.

I have observed that while there is a limited number who work hard to strictly enforce the law in accordance with the Chinese-exclusion act, I believe that there are more Chinese within the limits of the United States at the present time than there were on the 4th day of May, 1894, at the time of the close of the registration.

I believe that the largest number of those entering fraudulently enter through the different ports by connivance with so-called Chinese attorneys, who are allowed to appear and argue cases before the several collectors of customs, presenting Chinese evidence which is wholly unreliable, and often backing such evidence by that of Jews or hangers-on about Chinese quarters, or others seeking the trade of Chinese.

They usually come as one of two classes. Of the first class, I believe the greater number claim to be native-born Americans. Second, those presenting themselves with merchants' papers (which papers they seem to have no difficulty in procuring white men to certify to as Chinese well known to them as merchants). There is not 1 white man in 10 who has made the exclusion act a special study or who knows what constitutes a Chinese merchant. When they wish to procure a signer, merchants will introduce to such person a Chinese whom they state is a partner and a member of their company and who they claim is the party for whom such signer is to certify. After the signer of a certificate sees his name upon said certificate, upon its being returned for investigation, the result universally is that he is ready to make a statement to the inspector to the effect that the photograph represents some party well known to him. Should he state the contrary, a Chinese lawyer will prepare an affidavit and present it to him, which he usually signs. Then the attorney presents the sworn evidence as rebuttal to the inspector's report. The inspector not being authorized to administer an oath (which I believe is an error), he is without power.

I believe that 9 out of every 10 of the Chinese who pass through the United States in bond for Mexican points go with the intention of returning to the United States. I would suggest that Chinese passing in bond be photographed and as accurate a description be taken of them as is taken of a soldier who enlists in the United States Regular Army, and a description and photograph of these passing in bond be forwarded to ports of entry along the Mexican border.

In my opinion the temptation to substitute a prisoner, or person in bond, for

one who really wishes to visit China or some point in Mexico, is too great to allow guards appointed by the railroad company to guard the Chinese prisoners or those in bond, as the railroads are opposed to the enforcement of the Chinese-exclusion act, and keep up a constant fight for the Chinese against the Chinese inspector. I have every reason to believe that a large number of the railroad hands, such as conductors, engineers, and brakemen, derive quite a revenue for assisting in the smuggling of Chinese across the desert from border points (after they cross the line). It is almost impossible for Chinese to cross the desert unless by train, except in the winter season.

I believe that there is an organization existing, extending from San Francisco to Hongkong, including the cities where the ports of entry are established, with teachers on board the steamships, whose object is to illegally land Chinese. Further, that they have their schools to teach them a little English, and that by means of maps and charts the applicant is made perfectly familiar with the principal streets, the street-car lines, and principal places of business, parks, etc., about the point in the city in which he claims to have been born.

I believe that there is an organization in this city which landed 3 boat loads of Chinese from Mexico along the coast of this district, of from 19 to 26 each time, during my absence of 5 months from this port. The boat that is suspected of having done the work has been lying in the inner harbor at San Pedro for nearly 3 months, as on their last trip the danger signal was run up, and they returned from Mexico with a few shells on board. I believe that I have learned the signs and signals of this organization, and that I know a part of those so engaged.

The general standing and character of attorneys who represent the Chinese immigrant become very low after a considerable time is devoted to the work in that line. I believe that they, as a rule, become perfectly unscrupulous, and are ready to wink at or connive to introduce perjured evidence of the rankest kind.

I will state that the fees that were paid in the case of Sing Kum, a Chinese slave girl, who was ordered deported during the month of February, 1900, were \$250. The attorney asked \$150 more to appeal the case from Judge Wellborn's decision. Another attorney stepped in at this point and advised that the woman be allowed to return to China, and that he would make a set of papers for \$50, have her return to Mexico, and when she was across the border he was to receive a fee of \$50 more. The usual price in the case of men is \$75 if released before the commissioner, and an additional \$50 if the case goes before the district court.

I would respectfully recommend that in no case should the Government permit the Government's evidence to be divulged until the defense is prepared to complete the case, and if the case is appealed from the decision of the commissioner to come before the district court, it should be upon the evidence taken by the commissioner, and no further evidence should be admitted or considered. My reason for recommending this is that in most cases taken before the district court an entirely new line of defense is set up by defendant's attorney with entire new witnesses who are wholly unknown to the court or the officers thereof.

I believe that the best means of ridding the country of Chinese who have illegally entered would be to allow the commissioner or inspector to offer a reward of \$5 for each person, Chinese or others, who will give information leading to the arrest and deportation of Chinese illegally within the United States, to be paid after deportation. I believe that would do more toward detecting frauds than the addition of twenty new inspectors, as Chinese and those engaged in the business make it their business to know the whereabouts of the officers of the Government, and when attempting to cross the line or land a party they have their signs and signals.

Most of the labor on repairs and extensions on the Southern Pacific Railroad between Los Angeles and El Paso, Tex., is performed by Mexican peons, and the work of extension has been done either by Mexicans or the Chinese south of Los Angeles.

While I was in El Paso, Tex., from June until October, 1899, I believe that there were at least 100 per week of these Mexican peons who left El Paso to work on the Southern Pacific, the White Oaks, and the Santa Fe railroads.

I would respectfully suggest that there be a Chinese bureau established, independent of all others (as I look upon the Chinese exclusion act as a political law, which can only be handled upon that theory). All Chinese claiming to be native of the United States should be made to prove the fact of their birth by 2 white witnesses, at least 1 to have known of the fact of birth at time of birth and the other within 1 year after birth, statements to be made upon oath or by a record of birth made at time, with proof from white people that this is the identical person whose birth was recorded at that time.

That the Chinese inspectors be held strictly responsible for their acts and the

reports made by them, a record of which reports shall be retained by them, and that there be no appeal except to the Secretary of the Treasury from the decision of the inspector or commissioner, and in no case should the attorney for the defense see or know of the report of the inspector.

I will add that those not acquainted with Chinese and their habits and customs can not realize the demoralizing effect they have upon the young and rising generation. I venture to say that more girls are ruined by the wily Chinese, as few of them as there are, comparatively, than all other criminal classes combined. Stop and think of the Chinese at the washtub, with a young girl's wardrobe, then as her chambermaid, with his head shaved and with his white apron, and with that bland smile on his face, then turn and look at the ladies who visit their places. Can you believe that the Chinese are more than human? The Chinese as a class are a born set of bribers, gamblers, polygamists, and perjurers, and when anyone will show me 1 actually converted Chinamen among them, then it will be one I have not met. You may have evening mission schools for young men of the Chinese for young ladies to teach, and you will have no lack of pupils; but take the ladies away, and put a young man equally capable and religious in their place, and in a short time you will not have a Chinaman attending the school.

I would further recommend that in no case should a Chinese arrested for being illegally in the United States be allowed to give bail for appearance in court, and that the writ of habeas corpus should be denied in all cases.

I would allow Chinese merchants' wives to land only upon positive proof that she was the only living wife and in company with her husband, upon positive proof that he was married prior to his first coming into the United States. I know of several who were landed as wives of merchants who are kept in houses of prostitution.

I would allow Chinese laborers to visit their native land (but no adjacent country, as they usually visit adjacent countries only for the purpose of perfecting plans to illegally bring in contraband Chinese) and remain 2 years, upon depositing their certificates of registration with the proper authority and proving by 2 reliable white witnesses that had known the party for 2 years, that he was an industrious Chinese and not liable to become a public charge. In that manner we would dispose of his labor during his absence. There is not 1 out of 10 Chinese styling themselves as merchants and so registered who are genuine merchants except in name, as many a store or firm claiming to have from \$10,000 to \$15,000 capital and as having a list filed in the custom-house of from 5 to 15 partners, whose stock could be removed at one time in a single express wagon, and usually 1 or 2 men found about the store, the balance cooking or gardening or running gambling rooms until just before they wish to visit China, and still they have no trouble in procuring signers to their papers as being bona fide merchants. An example should be made of signers of such certificates by bringing them before the grand jury.

I would deport all Chinese prostitutes and Chinese women living in houses of prostitution, as I believe that they are really at the bottom of most of the high-binder troubles.

I would imprison at hard labor for a period of 10 years all Chinese found in the United States after having been once deported or denied landing, as they usually return in bond to Mexico and then return to the United States.

I would not land a Chinese child as the child of a merchant, as it is the custom of the Chinese who go to China as merchants to bring with them upon their return 1 or 2 children purchased by them, and land them as their own. I know of several such cases. I know of several very young children in this city who were brought into the United States in that way, most of them being sent to this city from San Francisco, though it would be impossible to prove it under existing customs.

I believe that only officers of the Government should have charge of Chinese in bond passing through the United States.

I believe that Chinese evidence, unless corroborated by at least 2 white witnesses, should have no weight before a court or jury.

I believe that Chinese inspectors should have authority to administer an oath, and when investigating cases should administer the oath in every instance.

The Chinese and Japanese do nine-tenths of the fruit packing on this coast south of San Francisco and most of the gathering of grapes and small fruit.

Very respectfully,

J. D. PUTNAM, *Chinese Inspector.*

EXHIBIT L.

AFFIDAVIT OF MR. FRED. W. WADHAM RESPECTING ALIEN LABOR AND ASIATIC IMMIGRATION.

STATE OF CALIFORNIA, *County of San Diego*, ss:

Fred. W. Wadham, being first duly sworn according to law, says:

He is now, and for six years last past has been, United States deputy collector, inspector of customs, having his headquarters in said county and State. That during all of said period of time it has been a part of his duty to prevent, so far as possible, the illegal entry of alien Chinese laborers into the United States; that during the said period the said affiant has become familiar with the question of alien immigration, and has become acquainted with the methods employed by Chinese immigrants and those who aid and abet them in procuring the illegal and fraudulent entry into the United States of Chinese laborers; that part of affiant's duty as such deputy collector is to guard and watch the boundary line of the United States and Mexico, and such portion of said boundary line as lies within his jurisdiction; that said boundary line within his jurisdiction covers about 18 miles of exposed coast and boundary line, nearly all of which extends in an uninhabited country; that the entire duty of patrolling, watching, and guarding said boundary line devolves upon this affiant and another deputy collector, and that it is altogether impossible for two men charged with other duties imposed upon them as deputy collectors to properly and effectually guard and watch said boundary line; that to affiant's certain knowledge Chinese laborers are continually coming into the United States over said line in violation of the so-called "exclusion act;" that such immigrants land from the China steamers in Mexico at different points along the coast and enter the United States either from coasting vessels or by following trails along the coast or over the mountains in United States territory; that such immigrants are constantly aided by resident Chinamen and by white and Mexican employers who are interested in bringing them into this country; that despite the most strenuous and vigilant efforts on the part of affiant and his assistant deputy said exclusion law is being continually violated.

Affiant further says that he has positive and definite knowledge that large numbers of indigent Mexicans, who have their homes in Mexico, are constantly coming over the line into the United States and find employment therein; that in affiant's judgment there are at least 150 Mexicans residing just across the line in Mexico who are constantly employed upon this side of the line; that said Mexicans work for a much lower rate of wages than is asked by American laborers, and that as a class they are not only indigent, but many of them are criminals and vicious, and that the effect upon such competition has a demoralizing effect upon the white labor in this vicinity; that to affiant's certain knowledge large numbers of Chinese laborers, who are denied landing at ports north of San Diego, come to Ensenada and ports along the Mexican coast and find their way over the line into the United States in violation of the exclusion laws. Affiant says that as a result of six years of observation and knowledge gained in the public service, coupled with knowledge gained from a residence of 15 years upon the Mexican border, he has no hesitancy in saying that with proper organization, and with adequate powers guaranteed to any inspector, it will be entirely possible to guard said line efficiently and prevent such fraudulent immigration of Chinese laborers into the United States along and over said line; that in order to accomplish such result, in the opinion of affiant, it will be necessary to detail some competent person to such work exclusively.

Affiant says that for a long time past he has had positive information of the existence of an organization, having its representatives at Los Angeles and different points along the coast and in the United States, the object of which is to aid in bringing Chinese laborers illegally into the United States; that the persons interested in such organizations are disreputable, and are even worse to deal with than the Chinese immigrants, their constant practice being the giving of bribes, subornation of witnesses, and the manufacture of false testimony.

Affiant further says not.

FRED. W. WADHAM.

EXHIBIT M.

AFFIDAVIT OF MR. P. H. MCCARTHY.

Mr. P. H. McCarthy, of the city and county of San Francisco, State of California, appeared personally before Special Agent Thomas F. Turner, and in reply to inquiries propounded testified as follows, to wit:

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

P. H. McCarthy, being duly sworn, deposes and says: I reside at No. 611 Stockton street, in the city and county of San Francisco. My official position for the past 6½ years has been and is at present president of the Building Trades Council. The Building Trades Council comprises all the trades which may be called upon to erect a building, preparing the material and executing the entire work. The approximate membership of the several branches of the Building Trades Council would number between 10,000 and 12,000 men employed.

I have resided in the State of California for 14 years on the 17th day of next April.

During my connection with the trades of the coast I have had an opportunity of investigating and studying the relations of white labor in connection with that of Asiatic emigration, and in regard to facts having come under my observation respecting the emigration of Chinese and the enforcement of the exclusion law I would state as follows:

The sugar industry was the first to bring to the attention of the people the great injustice being done to the white workmen of this State, and from that point on to the domestic labor employed. Wherever a Chinaman or Japanese is employed it displaces a white man. They are in our factories, they make our clothes; but we do not know it. It is the storekeeper who buys his goods from the Chinaman and sells it to the white man; therefore the storekeeper becomes the middleman. The result of this is that in the city and county of San Francisco, in comparison with the population, we have less white men employed than any city in the United States. It is to this great extent that our people suffer. As regarding the exclusion act, it was the one blessing, but the trouble is that the Chinaman is at liberty to pick out his place of business and do as he pleases. The people of this State decided that the exclusion act was a good thing and hailed it with joy; they are not only willing that it should continue, but will make their claim against its violation more potent. When the sugar fields were investigated and it was found that 95 per cent of the labor employed was Asiatic, how was the white man to maintain himself?

In regard to the idea that Chinese and Japanese labor is necessary in the cultivation in the fields of California, that most of the white labor is tramp and hobo labor, and that good white labor can not be secured to do the work, you will find that this statement is made by interested parties. The fact remains that these men are employing Chinese and Japanese to the exclusion of white help, and try to treat their white help in the same manner, placing them on a level with cooly labor. Should we submit to this? The rancher does not think we have a right to live as he does. We are citizens of the United States, yet he treats us on a level with his cooly help, places us in a shed, and does anything he likes with us. I have known some of the most honest and best citizens of the United States who, in order to accept the labor offered them, were compelled to live on a level with Chinamen and Japanese. They are thus driven to be tramps and hoboes.

I certainly think that it would be possible to secure all the white help necessary to meet the demand in the fruit districts, beet industry, and other departments where Chinamen and Japanese are now employed. If the stock yards of the city of Chicago can employ over 60,000 men, we certainly in this, the best climate in the Union, can have the laborers here. If the fruit grower will pay his white help sufficient and treat them as they should be treated, he will get reliable help and plenty of it.

In San Francisco the factories are filled with Chinese, making it impossible for our people to enter there. They can not go into the fields, for, as I have said before, they are filled with 98 per cent of Asiatic labor. The result of all this is that our people must walk the streets and resort to crime. There are more people driven into the country, sleeping in the haystacks, than we have any idea of. The firm of Miller & Lux have given an order to their several branches that no tramp shall ever be turned away from any of their places on the road, and thus feed over 400 men daily.

There has been a great increase in Japanese since the Geary law. They have not been excluded, and come as they please.

The labor interests of the West, and particularly of the coast, are in accord with the Industrial Commission of Washington to continue the rigid enforcement of the exclusion act, and every laboring man in the State of California will tell you that for the general good Asiatic labor should be kept out of the State of California.

P. H. MCCARTHY.

Subscribed and sworn to before me this 16th day of February, 1900.

[SEAL.]

JAMES MASON,
*Notary Public in and for the City and County of
San Francisco, State of California.*

LIST OF WITNESSES.

	Page.
Allen, W. H. , representative Advance Labor Club, Brooklyn, N. Y.....	161-166
Bealin, John J. , superintendent New York free employment bureau	223-230
